THE
ARCHITECT
A JOURNAL OF
ART, CIVIL ENGINEERING, AND BUILDING

THE WEEK.

THE Salon closed on Wednesday, and on to-morrow, Saturday, the medals will be distributed. Already the architects and sculptors are busy about emendation of the rules for next year, the painters being satisfied with the existing arrangements. It is considered that a reform is necessary in respect of the award of the Médaille d'Honneur. At present it is necessary for an architect to obtain nine votes before he gains the medal, and, as there are only fourteen members on the jury, it often happens that the requisite number cannot be obtained, and the medal is therefore retained. What the French architects propose is that there should be at least three trials, and if at the first and second the prescribed number is not obtained, then the medal is to be awarded to whoever secures the highest number at the third voting. The proposal is reasonable, for it is unfair to exhibitors to have it stated that no architectural design was deserving of the principal medal. Many eminent architects refrain from exhibiting, as they dislike to have a contest over their works which does not serve them or architecture. The sculptors desire, in the first place, that a rule should be laid down by which it will be rendered impossible for the medal to be awarded several times to the same sculptor. The rule which the architects seek, *i.e.*, that the vote of the majority is to prevail, is in operation in the section of sculpture; but the sculptors wish to have it abolished, so that henceforth no sculptor can gain the Médaille d'Honneur unless he has secured two-thirds of the votes.

A DECREE of Convocation was passed in Oxford on Tuesday, conferring the degree of Master of Arts upon Mr. HUBERT HERKOMER, Slade Professor of Fine Art in the University. Mr. HERKOMER'S name has also been among those proposed to the Emperor of Germany by the Senate of the Berlin Academy of Fine Art for the large gold medal.

THE French newspapers which are published in Egypt have discovered that England is about to take possession of the Boulak Museum, and transfer the whole of the contents to Bloomsbury. According to the legend the late Dr. BIRCH, the Keeper of Egyptian Antiquities, allowed his enthusiasm to get the better of him, and he let the cat out of the bag. M. MASPERO, the conservator, was to be dismissed, his successor was to be pliant, and within six months of the new appointment Dr. BIRCH was to be enjoying the sight of the treasures for which he so often longed. One part of the prediction was falsified owing to the death of the doctor. But it is certain that M. MASPERO has retired, and that we suppose is the sole foundation for the story. His successor is a Frenchman, M. GREBAUT. English diplomatists are, however, supposed to be already undermining him. One proof of our perfidy is forthcoming. The Khedive was persuaded to lend four beautiful Arab lamps to South Kensington, which were to be returned in two years. But they are still retained, and the excuse offered is that they are too precious to be sent on so long a journey. A people who will act in this way are supposed to be capable of anything. If we are to believe our neighbours, the museum at Boulak is a work that is eminently French, and owes its creation to the inspiration of the French Government. Moreover, M. MASPERO was always supported by French subscriptions. Is the Boulak Museum likely to be offered for sale, and are the French archæologists afraid that the opportunity will not be seized to enlarge the collection in the Louvre?

MR. SIDNEY COLLINS'S report on the Print Room in the British Museum records many important acquisitions during the year. Among them are an album of twenty-four pencil drawings of the marbles from the Temple of Phigaleia (presented by the Dilettanti Society); a view of Kirkstall Abbey, by JAMES GANDON, jun.; a water-colour of the interior of Bruges Cathedral, by JOSEPH NASH; a water-colour of the columns of the Temple of Jupiter in the Roman Forum, by CHARLES VACHER; a view of the leaning tower of Bologna, by R. P. BONINGTON; a view of Kenilworth, by THOMAS BAKER; and two sheets of designs in Indian ink for the monument of COLLINS, the poet, by JOHN FLAXMAN. DOYLE'S "Journal kept by Dick Doyle during the year 1840," THACKERAY'S "Bandit's Revenge," with illustrations in pen and ink, and an album containing ninety-six sketches and studies for pictures by FUSELI, have been also obtained. The acquisitions of the year amounted in all to 4,223.

THE Royal Holloway College at Egham, which was opened by Her Majesty the QUEEN on Wednesday, is the nearest approach to a realisation of Lord TENNYSON'S vision in "The Princess." In external appearance the colleges of Girton, Newnham, Somerville, and Lady Margaret are all very modest compared with Mr. CROSSLAND'S grandiose structure. The design, it will be remembered, was selected in competition. The late Professor HOLLOWAY obtained the advice of Mr. THOMAS HENRY WYATT, but he resolved to adopt no design which was not pleasing in his own eyes. His self-will is to be traced in many other things, and it is not impossible that the college will hereafter suffer on that account. He was disposed to consider himself as an imperial autocrat, but men of that class are not best fitted to be educational reformers. One of the features of the college is the picture gallery, on which nearly 100,000*l.* was spent

---

THERE are two open spaces at the outer limit of the metropolis which it is desirable to secure for the people's benefit. One is Clissold Park, near Stoke Newington. It will be said that as Finsbury Park is in the neighbourhood there is no need to expend the money that is necessary to purchase so expensive a property. But Finsbury Park is not sufficiently extensive for the needs of North London, and it should be remembered that if the present opportunity is allowed to escape another equally eligible is not likely to present itself. The second space is Ravenscourt Park, Hammersmith. That part of London is without a public park, and the objections which are supposed to apply in the case of Clissold Park will not hold. It appears the land is to be obtained on reasonable terms, and if the taxpayers could be polled a majority would be likely to be found in favour of its acquirement.

THE VENTILATION OF THE HOUSE OF COMMONS.

THE Blue-book containing the evidence which was given before the Select Committee on the Ventilation of the House of Commons is exactly the kind of document which gives satisfaction to the Intelligence Department in Berlin. The officers of the German staff, in providing for all possible contingencies, have to consider the possibility of an invasion of England—of course, it is simply in theory—and a good deal of value is attached to anything which throws a light upon our administrative power. When it is made evident that, owing to the peculiar organisation of our official system, it appears to be an impossibility to keep offensive smells out of the House of Commons (nobody seems to pay any attention to the other House), it is not unreasonable to assume that in case of invasion the system would also become inefficient, that one department would decline co-operation with another, and that, in fact, official logic would demonstrate in the clearest way, even if the Uhlans were at Clapham, that there was no invasion, and the inhabitants would be assured that they might sleep without apprehension of danger.

It would probably be hard to find a better illustration of the official way of doing business than has been presented in the Houses of Parliament. According to the established theory there cannot be too many departments. Instead of considering the ventilation and heating of the building as part of the architect's work, they were set up as if they were independent. Mr. GOLDSWORTHY GURNEY did not trouble himself about Dr. REID'S arrangements, and both officials ignored the trouble which they gave to the architect. Subsequently it was supposed that much was gained when the connection between the successor of Sir CHARLES BARRY and the House was severed by Mr. AYRTON. The old works and the new were to be controlled by the Office of Works, and it was anticipated that there was to be an end to all the grievances of which members complained, and which were attributed to the existence of a "family architect," to use Mr. BERNAL OSBORNE'S elegant phrase. But it was forgotten that Government Offices in England have a fashion of throwing impediments in the way of one another, and of treating zeal as if it were an impertinence. It is no exaggeration to say that in consequence of the official spirit—perhaps we ought to say the mutual animosity of officials—the control of the Houses of Parliament at the present time is not what it ought to be.

Take first the relation between the superintendents and the Treasury. Eight years ago the Office of Works, owing to an outcry about the state of the soil pipes and traps, made an application for 5,000*l.*, which was to be expended on drainage works for the House. The application "had to stand aside for more pressing matters." It was not renewed. It will appear strange that there was so much indifference shown by the Office of Works, but its dignity was, we suppose, offended by the refusal. At the time at least two-thirds of the water-closets were not in a sanitary condition. A civil architect would in such a case keep dunning the Treasury; but then of course he would have a personal interest in the grant.

If a civil architect had charge of the place, no allowance would be made if he did not accomplish new works in as short a time as if he had a clear field before him. It is evident that the Office of Works, with all its authority, has to work under restrictions at the Houses of Parliament. "The House adjourns the first, second, or third week in August," says the Clerk of Works, "and in November the House of Peers assembles again on appeals. Then we have to suspend the work in the neighbourhood; they will not permit either the knocking or the smell. Then the residents come back very soon; some of them are only away a few weeks. That again stops us, so that the time for doing this work is very limited indeed." Another difficulty arises from the fear of interfering with the privileges of the Serjeant-at-Arms and the Lord Chancellor, who have the appropriation of the rooms in their hands. Hence we read of the existence of dustbins within the building of an exceedingly objectionable character, of rooms being used as bedrooms which have neither ventilation or light, of a laundry which is "quite improper." Sir HENRY ROSCOE, the chairman of the Committee, relates how he found "it had been the practice of the contractor to place the whole of the dust and solid refuse of all kinds—vegetable, animal, and mineral—at the bottom of the staircase, where there was not the slightest ventilation, and which was in direct communication with the building." The revelations of the arrangements of the Palace of the Legislature are so strange, that it seems a mockery to have the Lords and Commons passing laws about sanitation which are inoperative in their own House.

The evil which is at the bottom is the strength of the departmental spirit. One department has got hold of the drainage, another has the heating and lighting, a third secured the kitchen and cooking arrangements, while a fourth carried off the cleaning, although in a somewhat incomplete form, since the washing of dirty linen was exempted. The Parliamentary Committee who investigated the condition of the House had not the courage to meddle with so many administrations, but they had a fear that the 13,000*l.* which they recommend should be expended on the House was not likely to be so well laid out under the existing system. It is therefore recommended as absolutely essential that "The designing and superintendence of the works in question should be entrusted to an independent expert of the highest professional standing, under whose personal direction the alterations suggested should be carried into effect." No slight is thrown on the officers of the Board of Works by the recommendation. In other words, the Committee desire that the state of things which existed before Mr. AYRTON'S *coup d'état* should be restored, only instead of an architect having a hereditary interest in the building, some sanitary engineer is to be appointed who will naturally value the commission by the amount of the expenditure.

According to the unanimous opinion of the Committee, "The health of the Members of Parliament and of the officers who reside within the precincts of the palace at Westminster is seriously imperilled by the defective drainage and sanitary arrangements which now exist in the building." This condition is no new discovery. It is evident, from the application for money which was made in 1878, that there was some fear of impending evil at the time. Noxious smells have pervaded the House. Dr. PERCY declared before the Committee of 1884 that he was perfectly certain they did not arise within the House. The conclusion was drawn that the smells must originate outside, and the potteries at Lambeth were first suspected. It was found on inquiry, however, that there was not the slightest evidence for supposing that Messrs. DOULTON'S great factories emitted noxious vapours. Then Sir LYON PLAYFAIR, who was a member of one Committee, suddenly discovered that the odour of Westminster corresponded with one which occasionally was wafted over his house in Onslow Gardens. He traced it to the brickfields at Shepherd's Bush. The Chief Inspector of Alkali Works, by a diplomatic feat of which he appears to be proud, ascertained that the smells arose from the burning of rubbish at one of the Millbank wharfs. But unfortunately he was without experience of the Parliamentary smell, although he believed he could make it out distinctly. Of one thing the chief inspector was quite confident, it could not arise from sewer gas.

Some doubt about the sewers of the House arose, however, and Major TULLOCH was asked to inspect them. He described the main sewer as being in very good order, except the lower part, which he likened to an elongated cesspool. That part, according to the Major, was abominably filthy. The sewer had been made far too large (it is 10 feet high); but if there were ventilators carried to the roofs, he believed there would be no nuisance from it.

The last Committee on the subject was a very strong one, for among the members was Mr. L. H. ISAACS, the architect, Sir HENRY ROSCOE, the chemist, and Dr. FARQUHARSON; Mr. TATTON EGERTON and Mr. RICHARD POWER were also intent upon the inquiry. Mr. ISAACS took nothing on hearsay. He not only went through the disagreeable task of examining the sewer, but he insisted on the entrance flap being closed while there, in order, as he said, that being hermetically sealed in, he would have an opportunity of ascertaining the normal state of the sewer. Having tried the side drains with a candle Mr. ISAACS found an upcast in about two-thirds of them, and it was so

strong on the inlet from the kitchen that the candle was nearly drawn from his hand. That sewer gas existed he was positive, and he was also satisfied that the penstock which is imagined to oppose the entrance of sewer gas from the low-level drain of the Metropolitan Board of Works was ineffective. "My opinion," said Mr. Isaacs, "is that the sewer gas which is drawn up and passed through the furnace in the Clock Tower is not the sewer gas we generate, but is extracted from the low-level sewer." Afterwards Mr. Isaacs made an inspection of the sewer at night while the House was sitting, when he found that the proportion of uptake was decidedly greater. The brickwork of the sewer was in good condition, but the side drains were introduced in the most erratic manner; some were in the crown of the arch, and in such cases there would be splashing which, as will afterwards be seen, has an important influence in spreading germs.

Mr. Isaacs was able to speak from experience, and he had no doubt about the sewer gas. Afterwards Dr. Percy was examined, and he said it was impossible, with the system of ventilation which was in use, for any kind of gas to enter the House from the metropolitan sewer. "I have been here for twenty-one years," said Dr. Percy, "and I think I have as keen a scent for sewer gas as any man living, for I have been searching for it all my life pretty well, by night and by day, and I have never once perceived the odour of sewer gas in the House or near the House." One of the members of the Committee was not satisfied with the statement, for he asked Dr. Percy what other explanation than sewer gas could be given for those wash-basins, which were reeking with horrible smells. The answer offered was, that the smells arose from the immense quantities of high-pressure steam which are now sent into the drain from the boilers used in connection with the electric lighting. Whether the explosion that occurred on Monday could be explained in that way remains to be seen.

The discussion as to whether the malodours were or were not sewer gas might last for an interminable time if no evidence could be given except the sense of smell of the witnesses. Fortunately a new mode of investigation has been introduced by Dr. Carnelley, a young man of great ability, who is professor of chemistry in Dundee. His process of analysing the air in closed spaces is so interesting that we give a description in the professor's words :—

First of all, we determine the amount of carbonic acid by the ordinary process. Then we determine the quantity of oxidisable substances in the air by means of very dilute Condy's fluid, with which a known quantity of air is shaken up, and by the bleaching of the fluid we can form a conclusion as to the amount of oxidisable substances present. That tests chiefly the presence of organic matter, which may be due in part to the combustion of coal, for instance, as you find it in the outside air, and therefore it would be necessary, in order to determine the analysis of air in a given place, to make experiments upon the outside air in order to know what the normal condition of the atmosphere was. Then knowing the composition of the outside air, and the composition of the air in the sewer, one knows from the difference between them the extra quantity of organic matter present in the air of the sewer. That second process gives you the total oxidisable substances in the air. The third process is the collection of samples of air in such a way as to allow any germs the air may contain to settle on gelatine, and thus render it possible to count the number of living micro-organisms present. These take a fortnight to grow, and then you can see for yourself and count the number of these things actually present.

The conclusions which were drawn by Professor Carnelley in his laboratory at Dundee are very remarkable, and suggest that he has discovered a method which will substitute precision for guess work. After giving tabulated statements of his observations he writes :—

A comparison of the results at Westminster with those we have obtained in a considerable number and variety of sewers in Dundee, shows that before the alterations the sewer air at Westminster was in a worse condition than the average of that in Dundee, notwithstanding that the sewers here are usually much smaller, and far filthier looking, and receive a much more miscellaneous sewage.

The ventilation at Westminster, on the whole, was not nearly so good as in Dundee. The alterations, however, have now rendered the condition of the air in the Westminster sewer very much better than that of the sewer air in Dundee.

We believe that by far the greater number of the germs found in the sewer came from the outside air, passing in with the ventilation, and that comparatively few came from the sewer itself; for, with few exceptions, they were apparently of the same kind as those found in the outside air. The exceptions referred to were some large colonies of bacteria, which very rapidly liquefied gelatine. They were found in the sewer air from near the Clock Tower. These we obtained both before and after the alterations. They most probably came from the sewer itself, as we have not found any like them in the hundreds of samples of air we have collected outside, or in schools, or in houses. We have, however, obtained some of them in the Dundee sewers.

At Westminster almost all the drains enter the sewer by pipes placed high up in the walls of the sewer, and hence cause a great deal of splashing. This is very objectionable, for it undoubtedly tends to largely increase the number of germs in sewer air. The germs thus imparted to the air are those which are most probably injurious to health.

We have made duplicate experiments, both in Dundee and at Westminster, in which the air was collected within a few yards of such a drain, with and without splashing, and have always found the number of germs much increased in the former case.

We believe that the presence of bacteria occurring in sewer air, other than those coming in with the ventilation from the outside, to be chiefly, if not entirely, due to this cause.

The increase in the number of germs in sewer air caused by splashing varied from 3 to 34-fold in different observations.

The investigation by Professor Carnelley confirmed the recommendation of Sir Robert Rawlinson and other experts, that the drainage of the House should be cut off from the low-level drain. The system proposed for adoption by the Committee is that known as Shone's, which will make it necessary to reconstruct the main sewer. In connection, other works will have to be carried out.

The Committee are not satisfied with reporting on the drainage. They consider that the vaunted means for ventilation in use are obsolete, and they suggest that, instead of the heated upcast shafts in the Clock Tower and the Victoria Tower, mechanical appliances for pumping in air should be introduced. An opportunity may therefore be given to inventors; but how far facilities will be allowed them for experiments is another question. Meanwhile the thanks of Parliament are owing to the Committee, and especially to Mr. Isaacs, for the skilful and energetic way in which the inquiry was conducted. In our experience we cannot recall a case in which so many important results were ascertained during a few sittings.

LITHOGRAPHY IN FRANCE.

[By a Correspondent.]

An English visitor to one of the Salon exhibitions can hardly fail to observe the large number of lithographs. Our Royal Academy has never recognised lithography as a branch of fine art, but in France it has a position corresponding with engraving and etching. It has *artistes hors concours*, jurors of selection, and medallists, like painting or architecture. With us lithographers are supposed to form a sort of mechanical trade. In France, in Belgium, and in Germany we find many painters of reputation who work on stone, and interpret their own and other painters' work by means of the crayon. A very high standard has therefore been reached, and lithographs are criticised with as much severity as paintings. An art which was practised by Delacroix, Decamps, Millet, and Meissonier could hardly be wanting in opportunities to display chiaro-oscuro, modelling, and composition. Indeed, it is mainly by the absence of colour that lithography is distinguished from painting.

It is difficult to praise one form of art without appearing to undervalue some other, and it may be supposed that we have a latent wish to oppose lithography to etching. We believe that each of them has a field of its own which can be held without rivalry. For some classes of work etching should have the preference, and as much can be said of lithography. Each has its special advantages and its shortcomings. But we have no hesitation in saying that etching offers more opportunities for concealing defective draughtsmanship than lithography. With vigorous light and shade one is not over-critical about contours, for a

plate having careless figures may be accepted as an effort to record a fleeting inspiration. Indeed some masters seem to be anxious to suggest that their work was hasty. This was one of REMBRANDT'S characteristics, and hence, as Mr. RUSKIN says, "a wash of sepia, rightly managed, will do more in ten minutes than REMBRANDT himself could do in ten days of the most ingenious scratching, or blurt out by the most happy mixtures of art and accident. The value of REMBRANDT'S etchings is always in the inverse ratio of the labour bestowed on them after his first thoughts have been decisively expressed." Many etchers would uphold REMBRANDT'S practice against Mr. RUSKIN, and maintain that the great charm of work of the kind is its apparent spontaneousness, and the more it seems to be impromptu the better. We need not discuss the question now, but it can hardly be denied that etching, which is produced according to the Rembrandtish spirit, is only adapted for original work. It does not serve for copies, and hence when a master like M. WALTNER undertakes a plate after a picture everything is avoided that might be suggestive of hurry. His surprising skill in light and shade is not used to cloak weak outlines.

If an artist draws badly he cannot conceal the fact when he tries to work on stone. His defects are revealed to every one. We have a notable instance of this in the H. B. caricatures, which have already become historic documents. DOYLE was a much better draughtsman than CRUIKSHANK, but one worked on stone and the other on copper, and the etchings appear to have been produced by the superior hand. When CRUIKSHANK'S plates are printed from stone, the original relief is lost, and with it much of the spirit which we ascribe to the artist. JOHN LEECH, who was possessed of more genius than DOYLE or CRUIKSHANK, produced capital lithographs in his young days. The reason was, that LEECH being a painter rather than a caricaturist, the innate skill in the light and shade which sparkles in so many of his landscape backgrounds was one of the qualities most needed by any one who draws on stone.

Lithography presents so many difficulties that it is not surprising that sundry artists have been afraid to meddle with it, and consoled themselves by undervaluing the art. Almost as much precision of hand is needed as in fresco painting. It is necessary to treat a drawing as if it were a painting, and never to forget the totality of effect in working up a part. The art has attractions for artists whose characters are almost opposite. It is adapted for men like DECAMPS and many French caricaturists who can dash off subjects with ease. They were enabled by it to have copies circulated within an hour after the drawing was made. Lithography is no less adapted for artists, who, in their patient pursuit of effects, resemble scientific inquirers. Examples of this species of lithography can be seen in the well-known series of plates from the pictures in the Dresden Gallery. If compared with the fine engravings which were produced towards the close of the last century, it will be evident that for reproductions of pictures no process surpasses lithography. We may even comprise photography among them, for what are considered the best photographs are largely operated on by draughtsmen in order to suggest relative "values," while many photographs are taken from lithographs instead of from the original pictures.

A few lithographs have been lately produced in Paris at the Librairie de l'Art, which will suggest the perfection which the art has reached. One is a sketch of *Wrestlers in a Booth*, by M. GEORGES BELLENGER, which was exhibited this year in the Salon. It is the artist's own design, and is produced in what may be called the painter's style of lithography. There is no apparent sign of elaboration, although care is evident throughout. It is well arranged, so as to form a contrast of character as well as of light and shade.

M. CAMILLE VERGNES is an artist who appears to be competent to undertake almost any kind of plate. One of his which is before us is a copy of the famous portrait of his master, LEON COGNIET, after M. BONNAT, who was also a pupil in the same atelier. The picture is now in the Luxembourg Gallery, and has been repeatedly copied, photographed, and engraved. In this case the head seems to be similar in size to the original, and the earnest expression of the old painter is rendered with a vigour that is surprising. M. BONNAT may well approve of the copy. It is in work of this kind that lithography seems unsurpassable. The face is expressed without any exaggeration of the contrast offered by the light and dark parts, and the coat and cap melt imperceptibly into the dark background. Taken as a whole it is the best interpretation we have seen of a portrait that has already become famous. In the *Esope* and *Ménippe*, after VELASQUEZ, M. VERGNES has to render a very different style of art to the foregoing. The faces are less strongly lighted, and the flesh tints have to be expressed by a sort of cross hatching, which is carried into the coats and even into the background. It is by this mode of handling that unity is imparted to the two large plates.

The *Hagar and Ishmael* in the Luxembourg Gallery is, like most of M. CAZIN'S pictures, most difficult to translate. The painter is one of the artists who have abjured the old rules about figures and background. With him the landscape becomes a necessary complement of the figures, and must be judged as inseparable from them. Take his *Hagar and Ishmael*, for example. He represents the mother as a *fille-mère*, standing weeping on a sandy heath; her hands cover her face. ISHMAEL, half-clad in goat's skin, and in appearance resembling a young Baptist, is before her, with his arms around her waist. There is no vast expanse of landscape, but we feel it is all as dreary as the part we see, and is bounded by a burning sky. It would be no easy task to copy M. CAZIN'S work in oils, but the difficulty is increased when there is only black chalk. It is necessary to think of effect in a plate, for the public may not take the same view as the admirers of M. CAZIN. But to give emphasis to the figures would be contrary to the artist's idea. It is also necessary to treat everything with a peculiar tenderness if the copy is to be suggestive of the original. If M. BAHUET consulted many lithographers he would be advised to give up his attempt, for there is no picture in the Luxembourg that is less fitted for a lithograph. However, he has tried, and has scored a success. The whole of the plate has the delicacy of a fine pencil drawing, and the scene acquires an inexpressible charm. As a specimen of lithography it is as great a departure from the ordinary style of work as the picture is in painting. It is not possible to possess the latter, but the print deserves to find a place in many houses.

Lithographs like those we have described are of a kind of which specimens can be rarely seen in England. The art, as we remarked above, has not been fostered in England, as it has been abroad. What is the consequence? Let the answer be given in the words of THACKERAY. "The state of art," he wrote, "amongst the people in France and Germany, where lithography is more practised, is infinitely higher than in England, and the appreciation more correct. As draughtsmen the French and German painters are incomparably superior to our own." It is not difficult to explain the reason for the superiority of foreign work. By the dissemination of lithographs which are examples of good draughtsmanship the public taste is improved, and moreover, young artists gain opportunities to exercise their skill. Hence THACKERAY made a strong appeal to the Academicians, who, at the time he wrote, were the representatives of English art, beseeching them to turn lithographers, in order that their countrymen might gain. The plates which we have before us are of a higher class than could possibly be produced in England, even with the aid of the Royal Academy. They have a permanent value as works of art, and the publishers merit a reward for their enterprise.

NETHER HALL.

A FIELD meeting of the Hertfordshire Natural History Society was held lately at Broxbourne, under the leadership of Mr. R. T. Andrews, of Hertford. On arrival at Nether Hall a paper was read by Mr. Andrews. The building is one mile and a half south of the Rye House, and half a mile from the junction of the rivers Lea and Stort, which formed the north-west boundary of the ancient royal forest of Epping. The ancient mansion was pulled down in 1773, and only the gateway left standing, because of the expense of destroying it. The hall is a good specimen of Tudor architecture, constructed of beautiful brickwork, and having a semi-hexagonal tower on either side of the entrance. It has been carefully preserved, especially of late years. It consisted of two floors,

upon each of which was a room 27 feet by 23½ feet, lighted by large windows; the ceiling of the first storey was sustained on oak arches, resting upon three blank shields and a truss composed of a radiant rose and at the back upon four trusses, the first and third of which represented griffins, and the second and fourth a bear and ragged staff; the western shield was supported by two horses (colts), the second by a spread eagle supported by a lion and unicorn, the third rested on a lioness and a bull ducally crowned; near the chimney was a colt's head in an ornament of the carving. The storey was wainscotted to the height of about 8 feet, and above the wainscot on the plaster were various figures representing personages of sacred, profane, and fabulous history. On the summit of the gateway are remains of two curiously twisted chimneys, like the one at the Rye House, and beneath the windows above the entrance was a machicolation and a trefoil ornament with shields and fleur-de-lis. A spiral staircase led to the summit of the tower and twisted chimney-shaft. The whole building was surrounded by a moat, and the moat was encompassed by a wall. The manor of Nether Hall was holden of Waltham Abbey, and in 1401 was conveyed by Thomas Organ to Nicholas Callerer and others. In the reign of Edward IV. the estate had become the property and residence of the Colte family. Thomas Colte was employed by that king on some service abroad; he died in 1476. John Colte took an active part in aiding King Henry VIII. in the dissolution of the monasteries. The last recorded possessor in the family was George, son of Henry Colt, knight, in 1635. From here Sir Thomas More married his wife, Jane Colt. The remains of several of the family are deposited in the chancel of Roydon Church, and commemorated by several handsome brasses. Brasses to Thomas Colte, "Edwardi regis consul Honorificus," 1471, and Joan, his wife; to John Colte and his wives Mary and Elizabeth; to Elizabeth, wife of John Stanley, gent., 1589, with five children, and the figure of a civilian, 1580. The estate now belongs to Mr. J. A. Houblon, of Hallingbury, Essex, and is occupied by Mr. Joseph Parish.

ARCHÆOLOGY IN SHROPSHIRE.

THE ninth annual meeting of the Midland Union of Natural History Societies was held last week in Shrewsbury. Although from the title it might be supposed that the members cared only to take part in geological or botanical excursions, still archæology forms a part of the programme, and on the second day there was a visit to Uriconium or Wroxeter. On arriving at the ruins of the Roman settlement, the Rev. Mr. Auden, who acted as cicerone of the party, said:—

Very little is known of the history of Uriconium. It is thought to have been founded in the time of the campaigns of Ostorios, about A.D. 50. It is mentioned by Ptolemy as being situate in the country of the Cornavii, and is alluded to in the second and twelfth Iter of Antoninus, and by Richard of Cirencester in his first, second, and thirteenth Iter. Tradition tells that it was destroyed by the Saxons in the fourth century. The excavations show that it was burnt to the ground, possibly after a struggle with the enemy, as a number of skulls were found near the fortifications on the river-side of the city. The ruins served for centuries as a quarry for the neighbourhood, but no excavations seem to have been made there till comparatively modern times. Mediæval legends attributed the ruined cities of an older time to demons, and few cared to disturb the earth, or to be near them after nightfall. In 1701 a hypocaust was discovered, and in 1734 a fine tesselated pavement; in 1747 some moulds for forging Roman coins, and in 1752 three Roman gravestones. In 1788 and 1798 several discoveries were made of coins, urns, &c., and the organised excavations of a few years back have brought many interesting objects to light. The coins found range in date from about A.D. 52 to A.D. 382. This may furnish a clue to the date of destruction of the city, as it was in A.D. 385 that the Roman garrison were finally withdrawn from Britain. Several great roads went out from Uriconium: one generally known as the Watling Street passed over the Severn and through Bravinium (Brandon Camp, near Leintwardine), towards Caer Leon; another passed due west through Berrington, and on by Lea Cross, Edge, and Stony Stretton, to its junction with the road from Rutunium to Caer Flôs; another went northwards through Newport to Chester; and another branched from the Watling Street at Pitchford, and passes by the Devil's Causeway to Rushbury.

During the walk around the remains of the unburied city several questions were asked, says a correspondent of the *Shrewsbury Chronicle*, and some were not answered. The purposes of the parallel walls so close together on the left of the entrance could not be explained, and the cicerone stated, to the surprise of some of the party, that the remaining portion of the wall above ground was not really a part of the wall of the city, the position of the latter underground being plain by the appearance of the green crops over it in dry seasons.

In the parish church of Wroxeter many interesting objects attracted notice, notably the tombs of the Newport family, a recently uncovered bit of fresco painting in the chancel, and communication between the chancel and the now demolished lepers' confessional. This aperture was said to be almost invariably found on the north side of the table; here it is on the south side of the east wall. Mr. Auden also called attention to a Latin inscription of a punning character, to the effect that Richard Newport, knight, had sailed to a new port, being received into the haven of heaven above. On the tomb adjacent was an inscription bearing the date of the death of the knight and a record of the death of his wife, but to the latter there were blank spaces for the day of the month and year which had never been filled in. The tomb was apparently erected by the wife, who left the blank space for the date of her own death. On a brass was an inscription recording the death of Lavaet Corfield and her spouse, both at the age of eighty-six.

The Rev. T. Auden read the following:—Wroxeter Church was originally a Saxon collegiate foundation. Domesday mentions the manor as possessing a church and four priests. The Fitz-Alans, the Norman lords of the manor, who had a house at Wroxeter, richly endowed the living, and probably were the first builders of the present church. William Fitz-Alan I., on July 25, 1155, gave the advowson of St. Andrew's, Wroxeter, to the abbey he had founded at Haughmond. This gift was, however, disregarded by six generations of Fitz-Alans, and not till the year 1331 did the abbey really obtain possession. In 1291 the church of Wroxeter was estimated as worth 23*l.* 6*s.* 8*d.* per annum. There were then three rectors thereof; the portion of the first was 20 marks, of the second 10, and of the third 5. In 1341 there were still three portioners, but in 1347 Richard de Brugge, Abbot of Haughmond, with the consent of Bishop Northburgh, virtually dissolved the Collegiate Church. In a deed dated October 3, 1347, the abbot stated the endowment of the vicarage. "He gives to the vicar that *manse* in the *vill* of Wroxeter in which the parish priest had been wont to dwell, two other messuages, and all the arable land which Sir Robert le Notinge had in demesne as pertaining to that portion in the church he held when living." He is also to have all tithes of wool, lambs, hay, fisheries, milk, geese, little pigs, bees, goats, eggs, flax, hemp, and apples, and sundry other tithes and rents. He was to serve the church of Wroxeter and the chapel of Eyton by proper ministers as they had been served from ancient time. There was a chantry of St. Mary in Wroxeter Church, probably founded in the thirteenth century, when the Fitz-Alans held the advowson, as deeds of Haughmond Abbey say that nothing was known of the giver. Eyton-on-Severn was the country seat of the Abbot of Shrewsbury till the Dissolution, when it was purchased from the King by Sir Thomas Bromley (Lord Chief Justice), from whom it passed to the Newports, through the marriage of Sir Thomas's only child to Sir Richard Newport, who made it his chief residence, and it was here that his grandson, Lord Herbert of Chirbury, was born.

On arriving at Buildwas Abbey, the Rev. T. Auden said the abbey of St. Mary and St. Chad at Buildwas was originally a Savigniac foundation, like Furness and several other abbeys. Their rule was a reformed and more austere branch of the Benedictines. In 1148 the parent abbey of Savigny, near Coutances, with its thirty-three dependent ministers, were given over to St. Bernard, abbot of Citeaux, and the grey Savigniac monks took the white habit of the Cistercian. The abbey of Buildwas was founded on August 8, 1135, by Roger de Clinton, the crusader, Bishop of Chester. Basingwerk Abbey, in Flintshire, St. Mary's, Dublin, St. Mary's, Port St. Mary, co. Wexford, and Istrad Marcell, near Welshpool, were all connected with Buildwas. The church, a fine specimen of Transitional work, is the most striking object of the ruins; then, passing by the sacristy, we come to the chapter-house, with its groined roof and four slender pillars of twelfth century date. The slype, or passage to the cemetery, divides the chapter-house from the hall of the monastery, of which few remains now exist. The modern house is incorporated with the abbot's lodging and a small chapel apparently once connected with the hall. The style throughout is that of the twelfth century, with but few later additions. In 1406 the Welsh burnt the church, but it is clear that the injury was confined to the destruction of the roofs. Buildwas Abbey was never of very great size, and at the Dissolution contained only twelve monks. Questions as to the cause of the rough stonework of the pillars of the abbey for some distance up on the inner side elicited no explanation of a satisfactory character; but the groined roof of the chapter-house drew forth unanimous expressions of admiration, and also an antique floor and ceiling in the house adjacent.

At Wenlock the abbey was the first place visited, and Mr. Gaskell kindly gave the party free access over the whole of the ruins as well as the residence adjacent, both of which were, of course, greatly admired. Mr. Auden gave the company the benefit of the following information:—St. Milburgha, to whom the Priory of Wenlock was dedicated, was a Saxon princess and abbess, who is said to have died here on February 28, 722.

Her abbey was destroyed by the Danes in 874, and William of Malmesbury speaks of it as deserted till Roger de Montgomery filled it with Cluniac monks ; but it seems more probable that it was rebuilt in Saxon times, though on a small scale compared with the magnificent edifice of which we see the ruins. The Cluniac rule was a branch of the Benedictine, from which it differed mainly in ceremonials. The dress was a black woollen frock, a white woollen tunic, and black scapular. Wenlock was, like all Cluniac houses in England, hampered by being a priory dependent on a foreign abbey, that of La Charité sur Loire, being charged with a yearly rent to the mother church of 100*s.* In 1333, however, it was regarded as tenth in the list of important English churches, but in 1337, when Edward III. confiscated the goods of the Lombards, Cistercians, and Cluniacs to provide money for coming war, it was made to pay 200*s.* as an alien cell. In 1395 it was naturalised on the payment of 600 marks to the Crown ; and on October 7, 1494, its bond to La Charité was finally dissolved by a Papal Bull. At the Dissolution the building was considered so fine that an effort was made to save it for a cathedral church for Shropshire, but the scheme fell through. The church was 332 feet long, and the side walls 60 feet high, the transepts being 144 feet from north to south. The south side of the west front remains to give some slight idea of its former beauty. It seems to have been mainly of the early fourteenth-century date, with traces of older work. Passing through the procession door from the church into the cloister garth, under the arches of the "Tresaunt," we come to the chapter-house, a very fine specimen of Transitional Norman work. Adjoining the chapter-house is the infirmary, and on the south side the cloister garth the remains of the refectory. Near to this is St. Milburg's Well, which has only lately been discovered. The quaint sculptures are worthy of note. Adjoining the infirmary, which forms now part of the modern dwelling-house, is the Prior's Lodging, a most interesting example of the domestic arrangements of the latter part of the fifteenth century. A building now used as an outhouse was possibly the guest-house of the Priory, and the square tower-like building near to the school was the almonry, where, on every Friday, forty shillings-worth of bread was distributed to the poor, and ten shillings in bread and beer every Sunday. At the Dissolution fourteen monks were pensioned from Wenlock, though in the twelfth century there were forty in the monastery. The revenues at the Dissolution amounted to 449*l.*, from which the Prior received a pension of 80*l.* a year. Three of the bells were sold to Wolverhampton Church, where they still remain. The abbey was granted in 1540 to Augustine de Augustine, Cardinal Wolsey's physician, who sold it to Thomas Lawley, and since then it has passed through various hands to its present owner. Prene Priory, St. Helen's, in the Isle of Wight, St. James's, Dudley, and Paisley were all dependencies of Wenlock.

The church was next visited, and then the magisterial and council chambers.

TESSERÆ.

Gothic Sculpture.

R. Westmacott, R.A.

If the human form is the object of imitation, it requires but little argument to show that the aim of the true artist should be to choose such conditions as will most correctly display the form, or, at any rate, that there should not be a studied effort to put it into distorted and impossible action. Portions or parts of the figure, for instance, should not be made to perform functions for which they are unfitted, and of which they are incapable in nature, nor should the most perfect work of creation be represented truncated or in pieces, and so fulfilling with the most complacent expression ignoble and even repulsive and degrading offices. Yet in true Gothic all this occurs, and is imitated as characteristic of the style. Figures represented as kneeling, standing, or sitting are squeezed into the hollow mouldings of arched doorways, in tiers, one over the other, though in the apex of the arch the upper figures may, by this arrangement, be nearly if not quite horizontal. Again, the most distorted attitudes are given to others to make them fit into angles or spandrels. Figures also, in parts or entire, are made to project suddenly at right angles from the walls, to support roof timbers, or to act as brackets, while their draperies clinging close show no natural movement, but, instead of hanging or floating, are fixed horizontally in folds parallel to the figure. In like manner heads of angels, saints, kings, bishops, and even females are made to bear weights, as brackets under columns, or as ornamental terminations to dripstones over windows or doorways for draining off the rain-water. Now in Gothic the anomalies of the grotesques, and even the indecency that is seen in gargoyles or draining pipes on roofs, and in stall seats and other parts of ecclesiastical buildings, are distinctly intentional. They are not like the crude attempts of the archaic sculptors in consequence of entire ignorance or of primitive rudeness of art, for they occasionally are found associated with a very advanced feeling for a certain kind of beauty, both of form and expression. In the head of dripstone terminations, and occasionally in drapery, there is evidence of unquestionable power in these respects, sufficient at any rate to show that the strange, grotesque employment of these sculptured forms was a part of the system of the old true Gothic design, and belonged to it, herein contrasting unfavourably, and to itself fatally, with the perfect sculpture which decorated architecture of the ancients—that of the Parthenon at Athens, for instance, of which we possess the original examples.

John Yenn, R.A.

James Elmes.

In the early part of the reign of George III. Sir William Chambers enjoyed the royal favour and almost the whole of the architectural employment of the day. Fond of ease, he indulged in his professional reveries in his office at the Board of Works. Not being a regularly bred architect, or even builder, he educated no pupils—that is to say, as the word is now understood ; he therefore formed no school, and left little more than his Somerset House, his Royal Exchange, Dublin, a few edifices of lesser notoriety, his Chinese buildings at Kew, and his treatise on "Civil Architecture" to perpetuate his fame ; but his name will always hold a distinguished place in the list of British architects. His only followers or pupils were bred in the office of the Board of Works, in which he held the situation of Surveyor-General. Of the first of these, namely, John Yenn, notwithstanding the honourable addition of R.A. to his name, the only known work is that part of the Treasury which faces St. James's Park, and grins horribly upon Holland's pretty edifice of Melbourne House and Kent's picturesque composition of the Horse Guards—and this is his only voucher to the honourable title of Royal Academician in the newly-established Royal Academy of Painting, Sculpture, and Architecture. This extraordinary event the architect commemorated by presenting his brother academicians with a geometrical elevation of his designs, shaded with Indian ink and tinted with gamboge in the manner of the day, and framed and glazed, with his autograph (John Yenn, R.A., architect). Of his right to this title Dr. Johnson bears witness in his Dictionary, wherein he says the "architect" is a noun substantive, and means a contriver of anything ; *ergo*, John Yenn is an architect, for he contrived the north front of the Treasury. His original (?) design for that contrivance is still in the collection of works presented by the Royal Academicians to the Academy.

Failures in Foundations.

E. Nash.

A very large proportion of failures may be traced to imperfect foundations, and too much care and sagacity cannot be exercised by the architect in arranging his underworks, keeping in view the principle that uniformity of bottom is of far more importance than anything else. We may imagine that he may build upon woolsacks if the whole be of that nature, and it is possible to build well upon a uniform bed of peat by carefully spreading the weight over the whole surface. Many structures have been so built, and, as respects London, most of the houses in the neighbourhood of Finsbury Square and Circus stand on a somewhat peaty bed, and the site of the beautiful mansion erected in 1816, for the London Literary Institution, had a bed of that sort. If the whole of that building had been founded upon the undisturbed surface of the peat, instead of cutting through it for the main external walls only, as was done, there would probably have been few, or perhaps none, of those irregular settlements which were occasioned by some subsidence of the internal walls, from the drying up of the peat a long time after the building had been erected, and which rendered underpinning needful. I do not mean to say that soft bottoms are to be coveted, but, on the contrary, I should like every architect to revel in the luxury of a hard one, such as chalk, which is about the best soil that can be had, very much on account of the homogeneity of its nature. When adding to old buildings it is often necessary to allow parts of old foundations to remain, and although it is bad in practice and has been sometimes attended with bad results, it cannot always be avoided.

Pedestals.

F. P. Cockerell.

The necessity for reducing the bulk of the pedestals of equestrian statues seems to have been universally felt. This has been done, in most cases, by breaking the pedestal in its length, and making the ends semicircular on plan, by this means preserving such a length as shall be in accordance with the impression of motion inseparable from a horse. In the crowded streets of modern cities a statue placed upon a pedestal of a low proportion would be lost unless the statue itself were of colossal size. This difficulty has been admirably met in several of the compositions of Rauch, in which the pedestal itself, being small, is raised upon a plinth, which is, in some cases, again subdivided or elevated upon a stylobate of

steps. Thus the barrenness of the long, unbroken line so constantly adopted in our own statues is avoided. The moulded capping and base and other enrichments have a rich and full proportion in reference to the die of the pedestal, without the exaggeration of actual size which becomes necessary in the large pedestal so commonly in use. Thus, the outline of the pedestal, rich in itself without crudely salient features, combines harmoniously with the statue, and within engages the eye, so that the plinth or podium below, being of the most simple and severe form, may be raised or lowered without materially affecting the composition of the principal object. We must suppose that it is this difficulty of the unavoidable prominence of the capping in large pedestals which has obfuscated the genius of some of our own sculptors, and driven them to the disastrous expedient of dispensing with all moulding in their pedestals, and placing their statues upon the chopping-blocks that offend our eyes in too many of our public places. It is not so easy to find a reason for the prodigious bulk of some of them, which are large enough to admit of a house being built upon them over the statue's head. I have not been able to discover the authority for the rapid diminution of the block sometimes adopted, which gives to the pedestal the character of a truncated pyramid; neither is the advantage of it at once patent. Much might be said upon the subject of London pedestals, but such has been the neglect of this accessory of monumental art that there would be but little room for favourable criticism. Our sculptors can scarcely be aware how much of the undiscriminating, though deserved, abuse levelled at many recent public monuments is due to the entire absence of proportion and design in the pedestals.

Mediæval Architects in France.

J. DALLAWAY.

Architecture is said to have been introduced into France by Charlemagne in the ninth century, and, if the churches erected by him are still perfect, with astonishing success. A school of architecture was then established in France, and it is asserted that they are not indebted to foreigners for the magnificent works which abound in that country. Rumalde, the architect of Louis le Débonnaire, the son and successor of Charlemagne, built the Cathedral of Rheims in 875. Ason built that of Séez, in Normandy, in 1050. Hilduard, a Benedictine monk, in 1170 planned the church of St. Peter at Chartres. Hugh Libergier, who died in 1263, was the architect of the celebrated church of St. Nicaise at Rheims. His contemporary, Stephen de Luzarche, began the Cathedral of Amiens, which was completed by Robert de Lusarche in 1222. The Abbot Suggerius had previously finished the church of St. Denis in 1140, which was considered as a model of perfection. The Nôtre Dame at Paris was built in the reign of Robert the Pious, but probably not the edifice now seen. The churches of Verdun, Laon, Liseux, and St. Remi at Rheims, are all of the thirteenth century. The architect Montreau attended Louis IX. into the Holy Land, and upon his return to France designed several churches, in which he introduced the ornaments and the style of those he had seen at Jerusalem. The Sainte Chapelle at Paris and the Abbey of Poissey are monuments of his skill. Associated with him was Joscelin de Courvault. At Rouen are two superb specimens of Gothic architecture: the cathedral, which is 408 feet long (that of Paris being only 396), and the width with the aisles 78. The nave is 334 by 34, and 100 feet high, and the central louvre, or open tower, is 240 feet high from the pavement. Of the abbey church of St. Ouen, the total length is 416, and the breadth of the transept 234 feet. In the fourteenth century, likewise, the grand cathedrals of Bourges and of Troyes in Champagne were finished. One of the lofty spires of the Cathedral at Chartres was erected in 1514 by John Texier. The finest cathedrals in France were built by the English during their possession of the northern provinces.

Stained Glass.

G. SHAW.

The coloured sheet glass used in making painted windows is made in two ways, each however being but a modification of the method of making spread glass—that is to say, by dividing and spreading a hollow cylinder. Sometimes the colouring matter pervades the whole of the glass of which the hollow cylinder is made; sometimes only a thin film is spread on one side of the cylinder; and occasionally the same or different colours are spread on the opposite sides of the glass: the former is called "pot-metal," the latter "flashed." The object in spreading the colour only superficially is to enable the workman, by removing the superficial colouring, to have a colourless surface on which he may paint, in enamel colour, another tint. When the same colour is on both sides, he may by removing one have a lighter tint of the same colour, or a colourless glass by removing both. When the sides are differently coloured, he may obtain the effect of the compound colour, of either singly, or have a colourless glass. Sometimes a window is constructed of pieces of coloured sheet glass, cut into the forms proper to each colour, and joined together by the plumber, such lines or shadows as are necessary to complete the simple design so executed having previously been drawn or stippled on the surface of the glass with an opaque black, fusible, enamel paint, which, by the application of heat, has been fused on the sheet of glass. Sometimes a piece of colourless glass is taken, and a design produced upon it by semi-transparent enamel colours being made into paints and applied with a brush, the after-process of "firing" effecting the partial fusion of the enamel paint and attaching it to the glass, the process of painting and "firing" sometimes being often repeated when the design is complex or the colours introduced numerous. It is commonly by a combination of these methods (that is to say, the insertion of pieces of coloured sheet glass painted upon with enamel colours) that painted windows are produced. It should be borne in mind that excepting the amber colour produced by peroxide of iron, when heated in contact with glass, and one or two others little used, no transparent colour can (practically) be "stained" upon the surface of colourless glass; all other colours, not produced in the manufacture of the glass itself, are applied by painting, the pigment being a coloured enamel more fusible than the glass itself, and further, that all such enamels have more or less opacity. In deciding what kind of designs should be produced in glass to be used for windows, the means at our disposal, not less than the purpose to which the design, when produced, is to be applied, require careful consideration. The transparent colours produced in glass are of the utmost purity and brilliancy; the range of colours, however, is limited, and gradation in the same piece impossible. The junction of the several pieces can only be effected by means which leave a black line of separation between them.

François Mansart.

F. MILIZIA.

This architect was never satisfied with his own designs, not even when praised by those who superintended, whence he often did the same thing many times over, ever seeking to add some improvement. The celebrated Colbert having requested him to make a design for the façade of the Louvre, Mansart opened his portfolio and showed him a number of sketches for it. The Minister was satisfied with them, and desired them to choose one and put it in a proper state to be presented to the king, at the same time requesting him not to alter it. Mansart refused to accede to this condition, not liking to be deprived of the liberty of changing it when a better idea occurred to him, and this was the cause of Bernini being sent for to Paris.

Gobelins Tapestry.

J. H. POLLEN.

The most renowned of modern tapestry, as is well known, is made at the State factories called the Gobelins, in the Rue Mouffetard, in Paris. This factory was established in the seventeenth century. A dyer, of the name of Gilles or Giles Gobeleen, a Fleming, established a dyer's shop there as early as the reign of Francis I. Two brothers, of the name of Cannaye, were makers of tapestry there at a later period. In the following century we hear of one Gouck, a Dutch weaver, and of a workman of his, of great skill, Jean Leoudson, who was the first to use the *haute lisse*. In 1667 Louis XIV., at the instigation of his powerful Minister, Colbert, established a State manufactory under the title of "Manufacture Royale des Meubles de la Couronne," in this building of the Gobeleens. Le Brun, the painter, was made first director. The designs of the tapestries made in the earlier years of this institution were from his pencil, and many have been engraved. At first the Gobelins factories were allowed to execute private orders. At present nothing is made there but at the expense of the State. The establishment is borne on the civil list, and the tapestries are either used for the State palaces or given as State presents. The work is finished with the completeness of painting, and is exceedingly slow of execution. A workman can scarcely execute in a year more than a square mètre, or a trifle more than a square yard. A piece may be seen in the Kensington Museum. The Gobelins tapestry is worked in the *haute lisse*—that is to say, the loom is upright, the warp threads are perpendicular. The weaver stands behind it, and has the exact picture or cartoon to work from. Each thread is passed through and pressed down so as to cover the warp completely, and is then brought through to the back. The older method was to use a *basse lisse*, a flat or horizontal loom with the painting under it, but the workman was unable to see with equal certainty what he was doing. The Gobelins tapestry is the most costly that is made, amounting in some instances to as much as 4,000 frs. (160*l.*) the square mètre. The dyes of the worsted are of extraordinary richness, and are very permanent. Old pieces of Gobelins of great merit may be seen in various houses in this country. In Paris, where old Gobelins tapestry sells at high prices, they have methods of manipulating the faded threads, and restoring their brilliancy, provided that the colours remain intact on the back, which is generally the case. In the early Flemish tapestries silk and gold threads were used, but the Gobelins confine the loom to the use of pure dyed wool fibre.

NOTES AND COMMENTS.

The great triumphal arch in the Champs Elysées has been surmounted for nearly three years with a plaster group of *Victory*, or the *Republic*, standing in a chariot drawn by several horses. It is the work of M. Falguière, the sculptor, who constructed the model in order that every one might realise his proposals for completing the arch. The group did not win approval when it was seen, but it was allowed to remain. The weather has operated on the plaster and it has become discoloured, while parts have fallen away. At length M. Falguière was requested to remove the figures, but he declined, and it is said he is not quite satisfied with his treatment. If the group were left standing much longer it would excite ridicule, for the spectator would see more of the framing than of the external coating. But how the difficulty was to be surmounted was not evident. To remove the ruin would be an interference with private property. The Government have at length decided to undertake all legal risks, and instructions have been given to M. Poulin, the architect, to clear the top of the arch and to restore it to its former condition. The history of the upper part is curious. Chalgrin, who might be called the original architect, proposed to surmount the arch with a figure of *Victory* in a car drawn by six horses. But Huyot, who was one of his successors, wished to substitute thirty statues on pedestals, with an open balustrade between them. It was Blouet who completed the structure, and apparently he did not approve of the sky-line being broken by sculpture in any way.

It is reported that M. F. Siemens has perfected the process for casting glass as if it were a metal, and that in a short time an experiment will be made with the material to ascertain how far it will serve for railway sleepers. In addition to its toughness and endurance, the glass cannot be affected by the atmosphere like other materials. The process is said to resemble the one in use for producing cast iron, but, instead of sand, finely-pulverised porcelain is used for the moulds. The material is obtained by depositing molten glass on plates of metal, and causing the mass to cool quickly. The quality will depend on the character of the metal employed for the plates. When iron plates are used the glass produced is about three times as strong as ordinary glass, but with copper, which cools quickly, the standard of strength rises to eight times. Cast glass will not be more expensive than cast iron, and in course of time it is likely to be the cheaper of the two. The new material can retain the transparency of common glass, and, while adapted for mirrors or windows, it can be utilised in many ways instead of iron and steel. M. Siemens believes it will cause a revolution in trade.

The English Consul at Nice reports that, owing to the success of the artistic pottery of Vallauris, two additional manufactories have been established at Nice and Mentone. The products of the latter are vases, with flowers in very high relief. Nice has gained repute for the mixed sober tints of the glaze, while M. Boutet has also just introduced a new and remarkably rich red. M. Clement Massier, the maker of Golfe Jouan and Vallauris, has also devised several new tints, and his exportation now reaches a total of 16,000*l.* a year. The ordinary domestic pottery of Vallauris is estimated at an annual value of no less than 2,000,000 frs., or 80,000*l.* It is supplied to various parts of France, and exported to Italy, and *viâ* Marseilles to Algeria, Greece, Spain, and Egypt. M. Magnat, the owner of the Mentone factory, which was visited by Her Majesty, produces about 30,000 frs. worth of his goods per annum, one-half of which is exported to foreign countries. Another example of Italian enterprise is found in the new glass works at Palermo. Under present arrangements from 800 to 900 square mètres of window glass per diem can be formed, but in the course of time there will be much more, including thick glass for building purposes. About 100 hands are employed. The sand is brought from Mazzara, on the south side of the island, and the salt, which is one-third cheaper than it is on the Continent, is also to be procured in Sicily. The greater part of the inferior glass hitherto imported came from Italy, the best glass being imported from France.

The annual meeting of the Association of Municipal and Sanitary Engineers and Surveyors will be held in Hanley on Thursday, Friday, and Saturday in next week. Some amendments in the rules will be proposed, and a new rule for the creation of a class of graduates. Papers will be read on "Rural Roads," "Sewage Operations in Nottingham," "Street Watering," "Public Supply of Electricity in Towns as an Illuminant," "The Economic Production of Coal Gas," and "The Refuse Destroyer at Nelson." Some of the sanitary and other works in the district will be visited.

The committee who have charge of the erection of the colossal statue of *Liberty* on Bedloe Island, New York Harbour, propose to have the inauguration on September 3, which is the anniversary of the signing of the Treaty of Versailles, by which the United States were recognised. But M. Bartholdi, the sculptor, desires the postponement of the ceremony for five or six weeks, in order that the masonry of the pedestal might be set before the weight of the figure came upon it. There is another reason for the delay. The preliminary expenses of the pedestal had to be borne by subscription. About 100,000 dollars were obtained, but the expenses will amount to five times that sum. President Cleveland has sent a message to Congress asking for a vote, which is not to be granted. Unless the newspapers can induce the public to subscribe a further sum to cover the expenses, there is a risk that the statue may be seized. That would be a strange and sad ending for a work which owes its existence mainly to a sculptor's enthusiasm.

The heavy rains which have fallen in Paris during several weeks, being absorbed by the foundations, have caused damage to buildings in progress, and much more was apprehended. For a time it was imagined that a part of the hill of Montmartre was likely to descend, and traffic was stopped in a few of the neighbouring streets. In cases of the kind wild notions are sure to spread, and it has been said that the impending danger was caused by the great church of the Sacré Cœur. M. Joffrin adopted this view, and, being an influential representative, found no difficulty in persuading the Conseil Municipal of Paris to institute an inquiry. The foundations of the building rest on piles which go down to the old quarry, and it may be assumed that if the ground was not stable, signs of a settlement must have been apparent in the masonry. But so much absorbent stuff is visible, it is not irrational to suppose that there will be danger until the ground around the building is covered with an impervious coating.

The Rev. John Scott, a brother of the late Sir Gilbert Scott, died of heart disease, in his seventy-seventh year, on the 17th ult. Mr. Scott, who had become a member of the College of Surgeons in 1832, graduated from Caius as thirty-sixth wrangler in 1846, and was ordained in the same year. He was curate of Long Eaton, Derbyshire, till 1847, perpetual curate of St. Paul's, Cambridge, till 1862, and rector of Tydd St. Giles's till 1867, when he was collated to the vicarage of Wisbech. He was appointed hon. canon of Ely in 1870, and rural dean of Wisbech in 1878.

The Free Public Library at the Patent Office, 25 Southampton Buildings, Chancery Lane, W.C., will henceforth be open to the public daily from 10 A.M. to 10 P.M., instead of, as heretofore, from 10 A.M. to 4 P.M. This library, in addition to the specifications, indexes, and other publications of the Patent Office, contains a large collection of the leading British and foreign scientific journals, transactions of learned societies, and text-books in the various departments of science and art.

The Board of Management of Montrose Lunatic Asylum lately obtained plans from several architects for the erection of a detached infirmary. These were submitted for report to Messrs. H. Saxon Snell & Son, who selected as the best those signed respectively "Lucidus Ordo," "Space," and "Good Samaritan." Ultimately it was determined to request the authors of "Good Samaritan" and "Space" to send in revised designs, and, in the result, the latter design, by Mr. Sydney Mitchell, of Edinburgh, has been selected for execution.

ARCHITECTURAL ILLUSTRATION SOCIETY.

1. PAINS HILL, SURREY.

2. NORMAN DOORWAY, CLYMPING CHURCH, SUSSEX.

3. LAMPS FROM ST. MARK'S, VENICE.

IT has long been felt by many members of the profession that some improvement in the illustration of architecture might be effected if architects themselves could have some control over the published illustrations. To this end a Society, which has taken for its name the "Architectural Illustration Society," has been formed. The arrangement of the sheet and style of the reproduction will be left entirely in their hands, and each sheet will be published with the Society's name attached to it. We have much pleasure in calling attention to the first three plates of the Architectural Illustration Society, which we publish to-day. Others will follow in due course. The honorary secretary of the Society is Mr. Mervyn Macartney, 52 Berkeley Square, W.

HOUGHTON HALL.

THE announcement of the sale of the Houghton estates by Messrs. Debenham, Tewson, Farmer & Bridgewater, must excite general interest, owing to historic associations, for they belonged to Sir Robert Walpole, the statesman who did so much to protect English liberty during a difficult period. Houghton, says a writer in the *Times*, was made by Sir Robert Walpole, who drew from secret service money without stint, and practically kept the keys to the strong boxes of the Treasury. There are no vouchers to tell what he spent, but he seems to have given *carte blanche* to architects, landscape gardeners, and house decorators. For once, when it was a question of the old family seat, Walpole was the most munificent patron of the arts. The cost of Houghton must have been something simply incalculable; for Sir Robert was far too free-handed and pre-occupied to stand on trifles with the artists and contractors he employed. He reminds us of the great king going to work at Marly or Versailles, grappling with impossibilities or difficulties, and giving *carte blanche* to the people he employed. The Squire of Houghton, then the master of England, sent down to his out-of-the-world Norfolk hall a host of skilled artisans with their overseers. The money to pay the wages is said to have been shipped in barrels and discharged periodically at the port of Lynn. He threw himself into the work with an insight and earnestness all his own; the master mind and the master's eye are conspicuous everywhere, from the broad general designs to matters of the minutest detail. He not only built his palace, but he laid out the park and woods, and designed the gardens with their formal embellishments. He swept away the old hall that had been his birthplace; he shifted the village to a site beyond his lodge gates; he restored the church where all the Walpoles lie buried. He called painters and sculptors into consultation to carve the cornices and elaborately chased chimneypieces and to decorate the panels and ceilings with classical and mythological designs. The taste of the architecture of the magnificent structure may be matter of doubt, and many have been the sarcastical criticisms passed upon it. But he showed his sound good sense in placing himself in the hands of designers of established reputation; and there can be no question as to the grace and harmonious beauty of the decorations. If the exterior of the building is oddly composite in style, everything within is a marvel of the unities. Then the interior was further enriched by a rare collection of paintings, though unfortunately most of the masterpieces were sold by the Minister's extravagant grandson.

The first impressions agreeably surprise one. Certainly the architecture is eccentric and almost grotesquely incongruous, but the general effect of the grey freestone is striking. The body of the building is an imposing square, with four quaint cupolas or domes flanking the roof at each of the corners. The front façade, with its lofty columns and bas-reliefs, is surmounted in the centre by a statue of Demosthenes—a flattery of the architect—supported on either side by figures of Justice and Britannia. Low semicircular colonnades, sweeping right and left, connect the mansion with its outlying wings, one containing the long and lofty picture gallery with its ante-room, and the other the servants' offices. The entrances originally were on the grand floor, the ascent to both the eastern and western fronts being by twin flights of broad steps with massive balustrades. These steps had a strange history. They were staked and lost at play by the grandson of Sir Robert. The shrewd winner was the owner of Claremont Hall, near Thetford, and he was sharp enough to stipulate that the stakes should be handed over at the loser's cost.

The present entrances are on the ground floor and are unpretentious enough. As the demolition of their steps never entered into the calculations of the designers, their best effects have been spoiled. Now we pass straight into what goes by the name of the arcade—a wide and low-browed crypt of white-washed stone, supported on ranges of groined arches. From the arcade doors open out upon the different corridors. The house ought to begin with the floor above, and there should be a really striking effect, looking up the central staircase. It mounts by easy quadrangular ascents to the roof of the mansion, and is lighted from a lofty cupola with richly-gilded mouldings. All the sides of the staircase are frescoed. But now there is no point from which you can embrace it in one comprehensive *coup d'œil*; for the basement is encumbered by a massive baldachino in stone, surmounted by a bronze figure of the Gladiator. It is by what was originally intended to be a back staircase that we make our way to the suite of State apartments. Nothing has been changed since Walpole built the house. The place is absolutely identified with one remarkable man. From the subterranean cellarage to the leaden coverings of the roof, there is the same thoroughgoing workmanship with the same disregard of cost. Whole shiploads of mahogany were specially imported from Honduras, and the state apartments and staircases, down to the very stillroom, are fitted with it in the same substantial style. Each door and window-shutter is about four inches thick, and the framework of the windows is of the same material. All that mahogany work, though simple in its design, is superbly gilded. So are the ceilings with their many compartments and the elaborate friezes and cornices. Everywhere are the same embellishments—the oak-leaves and the acorns, scallop-shells, and the badge of the Garter which was given while the mansion was being built, with now and again the initials of the builder. There is but one of the accounts extant connected with the building of Houghton, though all of them are said to have been scrutinised by a sister of Sir Robert's, who acted as his secretary and pay-mistress. It gives the cost of one of the gilded mahogany doors in the great drawing-room as 1,000*l*. There are five similar doors in the same apartment, while there are scores or even hundreds of others in the suite. These doors in the aggregate are but an item even in the wood-fitting, so that single bill may give some faint idea of the sums of money that must have been lavished on the hall.

The most interesting apartments in that interminable suite are Sir Robert's business-room and his dining-room. The business-room is a snug little library, with the folios and quartos still on the mahogany shelves just as he left them. And there is the high-backed elbow chair, which is said to have been his favourite seat, and the great writing-table, with the tiers of drawers underneath, in which he must have locked away many an important State secret. He used to withdraw to that work-room from the mob of his guests, when couriers were coming in and despatches were to be answered. But he was, at least, as much in his element of an afternoon in the dining-room. The dining-room is now styled the marble parlour, because the arched walls with the recesses between and the slabs of the sideboard are all in variegated Siennese marble. The defect in the arrangements was that the kitchens were far away. But heavy eating was subordinated to hard drinking, and the dining-room was appropriately consecrated to Bacchus. Over the fire-place is a fine alto-relievo of a sacrifice to the rosy god, and clustering grapes were sculptured everywhere on the ceilings and cornices, among the twining tendrils and the drooping vine-leaves. The dining-tables, though now taken to pieces, are still there, at which he entertained the foreign ministers who came to Houghton in his train and the troops of parasites who crowded to pay him court. And when the party in his great autumn gatherings overflowed the ample dimensions of the dining parlour the tables were spread in the noble hall next door, where he might have offered hospitality to half the county.

It would be tedious to give the inventories of the contents of the other rooms, which are less closely associated with him. The gems of the picture gallery were sold by his grandson to the Empress of Russia, but the walls are still fairly well covered. There is a good head of the minister over the chimneypiece in his business room, but the most pleasing portrait is that in the dining-room, representing him as a middle-aged man with a bright and benevolent face. Then there are sundry portraits of his two wives—the first of them, a Miss Shorter, daughter of a Lord Mayor of London, was the mother of his children—and of his only daughter, Lady Malpas, through whom the estates passed to the Cholmondeleys. In the great saloon is the set of Ciprianis, of which Horace Walpole wrote so bitterly when his

spendthrift nephew was replacing Guidos and Vandykes with the "daubs" of "that flimsy scene painter." There are still one or two heads by Vandyke, and some clever copies from the great Italian masters. But far the most attractive of the subjects left in the hall is Opie's *Fortune Teller*, with the sweet faces of a charming pair of sisters—the Gurneys of Earlham. Then there is a wealth of tapestry; the finest of the hangings are masterpieces from the Gobelin looms. And all were evidently woven to order, for the Walpole badges and monograms are to be seen everywhere running through the borders. Among the smaller objects of art are valuable articles of *virtu*; and Sir Robert seems to have greatly affected Japanese cabinets, of which some admirable specimens are to be found in a rather promiscuous collection. Standing over catacombs of cellarage, above light loam with a chalk bottom, there surely never was so dry a house. Although fires are never lighted in the library, the pages of the old volumes are unstained by damp, and in the stables hard by, which have never been repaired for 150 years, the first impression of the visitor is that the brickwork must have been newly pointed yesterday.

Houghton Hall was thirteen years in building. It was begun in 1722 and completed in 1735, as is recorded on a tablet let in above one of the doors. The timber Walpole planted was so excellent of the kind that his successors are tempted to fell and sell. His walnuts were cut up for musket-stocks in the Peninsular War, and the oaks commanded the highest price in the dockyards that were turning out the three-deckers for the Nile and Trafalgar. Appropriately enough, both Nelson and Wellington subsequently paid repeated visits to Houghton, and "the Duke" set an evil example to excursionists by scratching his name on one of the pillars of the colonnades. Houghton, by the way, was one of the two seats offered him by the nation, when he wisely made choice of Strathfieldsaye as the less expensive to keep up.

THE BRITISH MUSEUM.

THE following report on general progress at the British Museum has been presented to the House of Commons by the Trustees:—

In the autumn of the past year the Department of Prints and Drawings was moved into the new White wing, on the south-east side of the building, and, in placing the cases in their new position, the opportunity was taken for rearranging the collections in schools and classes convenient for reference. One of the upper galleries of the White Building will be occupied as a working room for students and artists, in place of a room on the mezzanine floor at present in use for the purpose, but found not to afford suitable accommodation. The full amount of furniture required for the exhibition gallery has not yet been delivered, but a selection of drawings and engravings will be placed on view within a few months from the present time.

Owing to gain of space resulting from the removal of the natural history collections, the keeper of the department of Greek and Roman antiquities has been able to place on view a large number of fictile vases, bronzes, terra-cotta figures, fresco paintings, and other smaller antiquities which it had previously been impossible to exhibit. He has also been enabled to make such a classified arrangement of the whole collection of objects as greatly adds to their value for purposes of study and illustration; the more important being placed in conspicuous positions and in favourable light. A further very considerable assistance for studying the collection of vases is being provided by an index to the subjects depicted on them, which is now at press. What is still urgently wanted for the department is suitable exhibition space for the sepulchral monuments and other antiquities stored in rooms in the basement, and not accessible to the public nor in light suitable for inspection by students. Proposals for additional buildings to bring these antiquities into view have been submitted to Her Majesty's Government, and are under consideration.

The completion of the arrangement of the ethnographical collection has been delayed by the necessity of revising that of the Oriental porcelain and securing the specimens in their cases, and also of placing the Hindoo and Buddhistic antiquities, the exhibition room for which intercepts an approach to the ethnographical gallery. Some sections have still to receive additions, and the labelling of the specimens remains to be carried out; but the rooms are now opened to public visitors, and will be found peculiarly attractive. The collections of Oriental porcelain and of Buddhistic antiquities in the adjacent room are also now on view.

In aid of the endeavour made at the International Exhibition of Inventions to illustrate the history of music, a selection of manuscripts showing the progress of musical notation from the tenth century onwards, with examples of choral service books, finely written and illuminated, part song books, lute music, &c, and with autographs of great composers of various countries, has been exhibited in the department of manuscripts, and a series of printed books of music has been placed on view in the King's library, descriptive guides being furnished for the exhibits.

Notwithstanding the accommodation given by the additional tables placed in the reading-room in the past year, the room is still frequently overcrowded, and at times visitors have to wait for a vacant seat. The average of daily attendance during the last five years has very much increased. In the twenty years from 1856 to 1875, the number of readers each year remained nearly stationary, at about 100,000, it being 105,310 at the close of the term. In the next ten years the number has risen gradually to 159,340, and at an accelerated rate during the last four years, previous to which the number stood at 134,273. The increase is greatly owing to the use of the electric light on dark days in winter, and the extension of hours to 8 P.M.; but it is also apparent during the ordinary hours. At all times of the day the room is much more filled than it was ten years ago, and the crowding is generally inconvenient in the afternoon. It becomes a question of difficulty how the continuous flow of demands for admission is to be met. The opening of free libraries might relieve the pressure, but, as yet, the parishes of London have not shown themselves generally willing to establish them; and, even if free libraries were accessible, the progress of education and other causes would probably always sustain the desire for admission to the Museum reading-room. It may, therefore, soon become the duty of the trustees to recommend to Her Majesty's Government measures for increasing the reading-room accommodation. It would not be practicable to enlarge the present room, but it might be thought advisable to open an additional room for readers in general literature, not engaged in special research, such as is provided in Paris by the Salle Publique in contradistinction to the Salle de Travail. In the meantime partial relief has been obtained by making use of a large room on the ground floor of the White Building for readers consulting newspapers and parliamentary papers, the greater part of these collections having been placed in the room itself and adjoining rooms.

With the view to assist readers in their studies, a press-marked index catalogue of all works of interest acquired for the library during the last five years, has been prepared by the superintendent of the reading-room, Mr. Fortescue. It is through the press and will soon be ready for use.

The departments of Oriental and of Greek and Roman antiquities have suffered from the loss of their keepers, officers of distinguished attainments and great experience, who had presided over them for many years. The death of Dr. Samuel Birch created a vacancy in the establishment which the neglect of the study of Egyptology in this country would have made it difficult to fill, had it not been that Mr. Le Page Renouf was found willing to transfer his services from another public department to the Museum. Mr. Renouf's knowledge of hieroglyphics, and of the hieratic and demotic characters, will enable him to continue the work of description of the Egyptian papyri commenced by Dr. Birch. During the long period of Dr. Birch's service as an officer of the Department of Antiquities, and as keeper of the Oriental Section, it was his good fortune to see an enormous extension of the collection by the addition of the Assyrian marbles and antiquities brought to light by Sir Henry Layard, and increased by subsequent excavations, and by the acquisition of a very large number of highly important inscribed cylinders and tablets from ancient Nineveh, and from Babylon and its neighbourhood.

As Keeper of the Department of Greek and Roman Antiquities for many years, Mr. Newton was prompt in availing himself of opportunities of making important additions to these collections, as in the purchase of the Castellani gems and jewellery, of sculptures from the Farnese Palace, of the Blacas collection of sculpture, vases, &c., as well as of individual works of the highest interest. He had also the satisfaction of finally arranging in a room built for the purpose the remains of the mausoleum, excavated by himself on the site of Halicarnassus, and of bringing into systematic arrangement the general collection both of sculpture and smaller objects

The increasing number of private lectures on several branches of antiquities shows a growing disposition to give studious attention to the collections. Miss J. E. Harrison has given thirty-five lectures on Greek Art; Mr. W. St. Chad Boscawen has delivered thirteen lectures to very full classes on the Assyrian and Babylonian antiquities; Mr. J. F. Hodgetts has lectured on Mediæval antiquities, and other lectures have been given on Greek sculptures and Egyptian antiquities. The whole number of lectures during the year amounts to 88. The practice of giving demonstrations from the objects exhibited to small classes is also on the increase, and suggests the hope that this most attractive form of teaching may before long be systematically established.

When the studies of archæology and ethnography become more generally accepted as proper to a higher education, the difficulty of finding a suitable lecture-room will have to be met.

At present rooms temporarily unoccupied have been used for the purpose, but this means of accommodation cannot be relied on for continuance, and none of the rooms devoted to the exhibition of the collections can be at all conveniently converted into lecture-rooms.

Entire sets of the Museum publications or selections have been presented to free libraries and to several other public institutions in the United Kingdom.

Sets of electrotypes of selected Greek and Roman coins have been presented to the Borough Museum of Sunderland, the Art Galleries of Wolverhampton and Oldham, the Bolton Museum, and the Free Library and Museum of Brighton.

Photographic reproductions of Italian prints have also been presented to art galleries and libraries in the United Kingdom.

A selection of 250 duplicate engravings and a set of the electrotypes of Greek and Roman coins have been lent to the Aberdeen Art Gallery and Museum for temporary exhibition.

THE HELLENIC SOCIETY.

THE annual meeting of the Hellenic Society was held last week at 22 Albemarle Street, Professor C. T. Newton, vice-president, in the chair. The hon. secretary (Mr. George Macmillan) read the report of the Council. After some reference to the contents of the last volume of the "Journal of Hellenic Studies," the report stated that 100*l.* had been granted towards the excavations on the site of Naukratis, with very good results, of which an account would be given by Mr. E. A. Gardner, who had superintended the work. Fifty pounds had been granted to Mr. Theodore Bent for excavations in Samos, which had not, however, owing to the conditions imposed by local authorities, led to much result. Reference was made to the proposed school at Athens, for which the house had now been built, and members of the society were invited to help to make up the required endowment by annual subscriptions. It was further stated that the sole use of a room at 22 Albemarle Street had now been secured for the library of the society. The balance-sheet showed a balance in hand of 621*l.* 13*s.* 10*d.*, over and above life subscriptions to the amount of 714*l.* invested in Consols. Forty new members had been elected in the past year. Eleven members had been lost by death or resignation. The total number of members was now 624, and of libraries subscribing to the journal seventy-two. The adoption of the report was moved by Principal Donaldson, who paid an eloquent tribute to the work hitherto done by the society, and expressed the hope that its number of members might be largely increased. The motion was seconded by Mr. A. S. Murray and carried.

On a ballot being taken the following officers were elected :—President—the Right Rev. the Lord Bishop of Durham ; vice-presidents—the Lord Justice Bowen, the Dean of St. Paul's, Mr. Sidney Colvin, Principal Geddes, Dr. J. K. Ingram, Professor R. C. Jebb, the Provost of Oriel, the Earl of Morley, Professor C. T. Newton, Professor A. H. Sayce, Mr. E. M. Thompson, the Master of Trinity, the Rev. H. Tozer, and Professor R. Y. Tyrrell. The following were elected to fill vacancies on the council :—Mr. Arthur Evans, Mr. L. R. Farnell, Mr. Ernest Gardner, Professor J. H. Middleton, and Mr. A. S. Murray ; while Professor Percy Gardner, Dr. Hubert Holden, Dr. Hort, Mr. H. F. Pelham, Mr. W. C. Perry, and Mr. J. R. Thursfield were re-elected.

In the usual address from the chair, Professor Newton reviewed the chief archæological discoveries of the past year, which, though not many, were pregnant. He first named the remarkable discovery of archaic statues on the Acropolis at Athens. Of these photographs were submitted to the meeting by Dr. Waldstein. Excavation had also taken place at Eleusis and in Bœotia, where a temple of Apollo had been found, and in it certain bronzes similar in character to the famous Apollo of Kanachos. In Crete had been found a grotto which was supposed to be identical with the traditionary birthplace of Zeus. In the island of Lemnos had been found a very remarkable inscription, in Greek character, but quite unintelligible. It might possibly represent the Pelasgian language, akin to the Etruscan. The inscription was published in the *Bulletin de Correspondance Hellénique*. During the last year the Germans, always very thorough in their excavations, had made arrangements for a final exhaustive examination of the site of Pergamon. The first instalment of the official record of their previous discoveries there had now been published in Berlin. Meanwhile other workers had appeared in the archæological field—our kinsmen from America. Special mention was due to the extraordinary industry of Dr. Sterrett in Asia Minor. He had collected countless inscriptions and had identified the site of Lystra, which had been visited by Paul and Barnabas. Dr. Sterrett's work might fitly be compared to that of Professor W. M. Ramsay, who had quite recently started on a fresh expedition into Asia Minor. Though the record of discoveries at Rome did not strictly come within the province of the Hellenic Society, the bronze figures lately found in the Via Nazionale deserved mention, as one of the figures, a seated athlete, almost certainly belonged to the school of Lysippus, between 330 and 300 B.C. At Smyrna the Evangelical School, which had done so much good work in the past, had in the past year resumed the publication of inscriptions. At Constantinople a patriotic Greek gentleman had given a large sum for the examination of manuscripts in the monasteries of the Levant, and some remarkable manuscripts—*e.g.*, letters of Julian and of Libanius—had already been discovered. A catalogue was being printed by the Syllogos Philologikos of Constantinople. The papyri found at Fayum in Egypt had now been carefully arranged at Vienna, and a short report had been published. They included a manuscript of the Gospel of Matthew and part of that of Mark, which was thought to be the earliest in existence ; a manuscript of Plato's Gorgias, also regarded as the earliest ; fragments of Hesiod, of the Argonautica and of the Odyssey ; and documents belonging to the Alexandrian and Arab periods which would need years of study. In conclusion, the chairman alluded to the thoroughness and beauty of illustration in the archæological publications not only of Germany and of France, but even of so poor a country as Greece, where the Ἐφημερὶς ἀρχαιολογικὴ was a most creditable production. In England such works were few in comparison with the wealth of the country, and it was much to be wished that private aid were more readily forthcoming in such undertakings. Mr. Ernest Gardner gave a short outline of the year's work at Naukratis, explaining that a full report was impossible until the mass of material had been carefully sorted and examined. Besides the great Hellenion and the temple of the Milesian Apollo found last year by Mr. Flinders Petrie, the temenos of the Samian Hera, the temple of Aphrodite, and the temple of the Dioscuri had now been discovered. The cemetery too had been cleared, but contained no graves that could be assigned to an earlier period than the fourth or fifth centuries B.C. The temples were remarkable for their simplicity, almost rudeness, of structure and material, and thus for their testimony to the characteristic readiness of the Greeks to adapt their work to local conditions. The material in this case was mud-brick. But the most important find of the year was a thick stratum of miscellaneous fragments of pottery and sculpture, which lay at about the level of the floor of the earliest temple of Aphrodite. Three specimens of pottery, a bowl, a plate, and an askos, which had been pieced together, were exhibited, and Mr. Gardner hoped that many more might result from further examination. The specimens shown were of a very fine and delicate ware, of Rhodian character, though possibly made on the spot. The statuettes, which Mr. Gardner described in some detail, were still more important for the light they seemed to throw, by their partially Egyptian character, upon the development of Greek sculpture. Mr. A. H. Smith, who had been at Naukratis, bore testimony to the thorough and skilful way in which the work had been carried out.

After some remarks from the chairman, the honorary secretary read a short paper by Mr. Theodore Bent upon his recent visit to Samos. This will appear in the forthcoming number of the "Journal of Hellenic Studies."

ARCHÆOLOGICAL ASSOCIATION OF IRELAND.

A GENERAL meeting of the Royal Historical and Archæological Association of Ireland was held in Dublin on Friday last. The secretary explained the financial condition of the society. They had 200*l.* balance on the current account, 12*l.* lodged in a special account, 10*l.* lodged in a Dublin bank, and 400*l.* in Three per cent. Consols.

A discussion arose as to the arrears into which the society had fallen with regard to the publication of the Journal and annual volumes, the last of which had been published in 1877.

The Secretary read a letter from Colonel Wood-Martin agreeing to undertake, at the request of the society, the honorary editorship of the Journal for a period of six months until a suitable gentleman was found.

Mr. Garstin proposed a vote of thanks to Colonel Wood-Martin for assenting to the request of the committee to act for some time as honorary editor of the society's publication. It was proposed that he be authorised to engage the assistance of Mr. Wakeman, and, if he deem it desirable, to use as materials for the Journal the matter already prepared for the annual volume.

The resolution was passed unanimously

On the motion of Mr. Cochrane, seconded by Dr. Joly, it was resolved that the committee be authorised to communicate with the local secretaries of Down and Armagh, for the purpose of holding the next quarterly meeting for Ulster, in July, at Newry, or other places selected by them.

The Secretary read a copy of a memorial to the Right Hon.

W. E. Gladstone, on behalf of the widow of the Rev. James Graves, who was the founder of the Archæological Association in 1849, and who up to his recent decease had acted as its hon. secretary. The memorial, after giving a short account of the work of the society since its foundation, concluded by appealing to the right hon. gentleman to make Mrs. Graves an allowance from the civil list.

The members present expressed on behalf of the society their approval of the memorial.

The proceedings terminated.

MANCHESTER ARCHITECTURAL ASSOCIATION.

On Saturday last seventeen of the members of the Manchester Association responded to the invitation of the president, Mr. L. Booth, F.R.I.B.A., for an afternoon's practice in sketching in the grounds of his residence, Crumpsall Green. Two hours (three to five) were allowed for sketching, two prizes of 2*l.* 2*s.* and 1*l.* 1*s.* respectively having been offered by Mr. Booth for the best and second best sketches. Competitors were allowed to finish their work either in water-colour, pencil, or ink, and Mr. A. Darbyshire, F.R.I.B.A., was the judge. His decision is, no doubt, awaited with some interest. After sketching, the gentlemen present enjoyed the hospitality of Mr. and Mrs. Booth, and the remembrance of the kindly welcome they received, and the happy combination of work and play (bowls, tennis, &c., were afterwards indulged in), will probably contribute to render the afternoon and evening one of the most pleasant memories of what has, in many respects, been a very successful session.

VICTORIA HOSPITAL FOR CHILDREN, CHELSEA.

The New Out-patients' Department and Nurses' Home of this building was opened on Wednesday by the Prince and Princess of Wales. A specially-designed golden key, made by Messrs. Chubb & Sons, was presented by the architect, Mr. H. Saxon Snell, to their Royal Highnesses. The heart-shape of the bow of this key is suggestive of Charity, while the group of Charity herself with children round her, surrounded by rays against enamel, completes the idea. The princely coronet which surmounts the bow has below it a shield giving the combined arms of the Prince and Princess of Wales, beside which on either side are the Prince's plumes with motto, the Danish raven's wings underneath on the right also referring to the Princess. The Æsculapian emblem of restoration to health—the serpent drinking from a patera—appears to the right of the group, emblematic of Charity; whilst on the opposite side are the heart and the joined hands suggestive of benevolence and aid. The juncture between the bow and the stem of the key is enriched by a coronet. Between this and the main fluted stem appears the device of the Princess Louise on the lozenge-shaped shield usual for a lady. On the obverse are the arms of the Princess, and on the reverse the family charge of "Lorne," both in enamel. The reverse of the bow of the key has a heart-shaped shield enwreathed by palms, and bearing the following inscription:—"Presented to Their Royal Highnesses the Prince and Princess of Wales on the occasion of opening the New Wing of the Victoria Hospital for Children, 30th June, 1886."

The hospital was established in the year 1866 for the treatment as in-patients of boys between the ages of two and twelve years of age, and of girls between the ages of two and sixteen; also as out-patients all children under sixteen years. It is also a training-school of nurses for children.

Accommodation is provided for sixty in-patients in the old building occupying the original site, and which has been judicially altered to the purposes of a hospital. It is, however, contemplated as soon as funds will permit to add an additional wing constructed upon more modern principles. Hitherto the only accommodation for out-patients has been the basement of the old building.

The accommodation for the nursing staff was also very inconvenient, as part of it had to be located in premises on the opposite side of the Queen's Road.

The architects of the new building are Messrs. H. Saxon Snell & Son. The ground floor is devoted to the purposes of an out-patients' department, consisting of a waiting-hall 53 feet by 20 feet and 16 feet in height, and ranged down one side of it are the surgeon's and physician's rooms, a dressing-room, and a small ward for the temporary accommodation of those patients who have undergone operations. At one end is a dispensary, with a separate small waiting-room for nurses coming from the main building for medicines. This department is also entered by a gate from Tite Street, and the courtyard giving access to it has a low shed ranged down one side for the protection from the weather of the children's perambulators. The upper part of the building is entirely detached from all communication with the out-patients' department upon the ground floor. It consists of three floors containing twenty-nine bedrooms for the nursing staff and sisters, and in addition a sitting-room and bedroom for a superintendent. Two sitting-rooms are also provided, the one for nurses and the other for lady probationers. The basement of the building contains the porter's apartment and mortuary, post-mortem room, a drug store and cellarage. The cost of the structure will be 7,500*l.*

The builder is Mr. Charles Wall. The heating and gas-fittings were supplied by Messrs. Berry & Sons; the locks and ranges by Messrs. King & Co., of Hull; the sinks and baths by Messrs. Cliff & Sons, and the tiling by Messrs. Simpson & Sons.

Bygones.

"*Antiquity after a time has the grace of novelty.*"—Hazlitt.

THE COMPETITION FOR ST. GEORGE'S HALL, LIVERPOOL.

In the early part of the year 1839 an announcement was made of a competition for the proposed St. George's Hall, Liverpool. Almost simultaneously a committee of the Institute of Architects had prepared a report on competitions, in which it was pointed out that a reform was necessary in the drawing up of instructions and in the mode of judging the designs. Some correspondence which took place between Mr. E. B. Lamb (an architect who is likely to be remembered by his Martyrs' Memorial Church in Clerkenwell) and the committee will suggest how so important a competition was conducted.

The first intimation (says Mr. Lamb) which I had of the proposed erection of St. George's Hall was a plan (with printed resolutions and instructions to architects) from a committee, which was sent to me by post, but without any name to it except that of the printer. The printed plan and instructions are very well as far as they go, except as to the time specified for sending in the designs, which is so very limited that, unless competitors neglect a certain business for an uncertain one, the drawings cannot be prepared with that attention which a building of this extent demands. Immediately after the receipt of the printed instructions, I wrote to the chairman of the committee—for I did not then, nor do I now, know his name—to request he would give me further information on the subject. In this letter I referred him to the report of the Royal Institute of British Architects, and quoted the queries therein named, together with some others I thought necessary. The queries are as follows:—

1. By whom are the designs to be examined and selected?
2. Have any designs been laid before the parties previously to the competition being proposed?
3. Have the parties any architect, or person professing to be an architect, in their employ?
4. Will any means be adopted to ascertain that the designs can be executed for the sums estimated?
5. Will the parties undertake to lay aside all designs which cannot be executed for the sum estimated?
6. Is it the intention of the parties at once to exclude from the competition all designs not in strict conformity with their instructions in every respect?
7. Will the architect whose design is selected be employed to execute the work, provided his character and standing in the profession is such as to render him unexceptionable?

To which letter I received the following reply:—

Liverpool: March 14, 1839.

Sir,—Our answers to the queries of your letter are as follow:—

1. By the committee; a body of gentlemen of the first respectability in Liverpool.
2. No.
3. No.
4. See ninth paragraph of the printed particular.
5. See ditto ditto.
6. It is.
7. Most probably.
8. First part—No. Second part—Yes.
9. Two premiums—250 guineas and 150 guineas. (See advertisement in London papers.)
10. Good; no unusual expenditure.

I am, Sir, your very obedient servant,

E. G. Deane, } Sec.
Thos. Harvey, }

E. B. Lamb, Esq., Architect,
25 Henrietta Street, Brunswick Square, London.

It is evident enough how very unsatisfactory the first answer is. Respectability is certainly an important part of the qualifications of a committee man, but that it implies intuitive knowledge in architecture I think may be doubted. It would be a novel mode of proceeding if a lawyer were applied to to sit in judgment in a surgical case, and it would be equally novel for a surgeon to usurp the powdered wig and gown of an advocate, yet in neither case is it necessary to have a knowledge of the principles of taste as well as practice. Yet in architecture a committee is formed of respectable persons, without any previous acquaintance—the subject, to sit in judgment upon probably 80 or 100 different designs, comprising perhaps nearly 1,400 drawings. If they are not in the first instance bewildered by the confusion of subjects before them, and at once get out of their difficulty by applying to a well-known architect for a design, instances of which have more than once occurred, they perhaps form their opinions from a showy design, without taking into consideration the correctness or incorrectness of the architecture, the practicability of its execution, the convenience of accommodation, or the likelihood of its being erected for the sum specified.

I will now only call attention to the seventh query and answer. The query is sufficiently explicit to expect an unqualified reply, yet we have one, considering the want of candour apparent in the committee, of a very suspicious nature. I do not for a moment doubt the respectability of the committee; but they appear determined that no influence of any kind shall bias them, not even that of an inquiry if they are acquainted, as amateurs, with architecture.

The remaining answers relate merely to unimportant questions. I may just state that the advertisements did not appear in the papers until some days after I had received the printed instructions; at least I did not see them.

After a lapse of some time I found that other business prevented me from time to time giving that consideration to the subject which its importance required, and upon calculating the time it would take to prepare the necessary drawings to my own satisfaction, and without great inconvenience and loss to myself, I determined to write again to the committee for an extension of time, and also to recommend a public exhibition of the designs previously to any decision being formed by the committee. A copy of this letter is subjoined:—

April 9, 1839.

Gentlemen,—I beg to thank you for your reply to my letter of inquiries relative to the St. George's Hall, Liverpool, and I trust you will accept my apology for again troubling you; but I am now about to ask a greater favour, and one that, if granted, will be a boon to the profession, who are about entering this competition, namely, for an extension of time for sending in the designs. And when I point out to you this necessity for doing so, together with the benefit which must be the result to the committee, I hope it will not be considered an idle request.

From the printed particulars furnished to architects by the committee, it is evident that the designs cannot be completed with fewer than from twelve to fifteen drawings, nearly all of which will require to be drawn on double elephant paper (3 feet 4 in. by 2 feet 3 in.), since the requisite subjects will probably be as follows:—Ground plan, one pair plan, two pair plan, at least three or four elevations, three or four sections, and one or two perspective views. This is the smallest number of drawings which will be necessary, in order fully to explain each design. Now the actual time for the mere labour of making such a series would be at least from thirty to forty days; while to prepare an estimate and description would occupy at least five or six days more—so that from five to six whole days would be required for this purpose alone. The most important part of the task, which I have not yet mentioned, is that of preparing the design itself, preparatory to making fair transcripts of the several parts of it, the time requisite for which it is utterly impossible to state, since it must depend entirely upon the study bestowed by each individual in maturing his first ideas. In some cases, therefore, this preparatory labour may be very considerable—in others, exceedingly little: almost the very first ideas that happen to present themselves being adopted and proceeded upon at once, however stale and commonplace they may be in themselves. Consequently, if inadequate time be allowed for duly considering the subject, little more perhaps than could, without inconvenience, be spared for merely making out fair copies of the original sketches, many architects will, on that account alone, be deterred from entering into the competition, feeling that, unless they should happen to succeed entirely to their own satisfaction in the very first instance, they would have no time for reconsidering or correcting any of their sketches—probably be compelled to let pass many imperfections they would afterwards detect. It is hardly to be supposed that any member of the profession who has any practice at all can devote the whole of his time to works where the chances are a hundred to one against his success; therefore, if the committee require designs from men of experience as well as from the juniors, they will at once see the necessity of an extension of time.

I am aware that a single application of this nature will have but little weight; but from the conversations I have had with several members of the profession, I am induced to think that the majority, if not all, would feel benefited by being allowed more time for preparing their designs. Yet if none applied, there would be but little hope of obtaining this boon. I need hardly state that the committee would also be gainers in the like proportion, as a work of such magnitude requires the greatest deliberation, not only on the part of the architect who produces the design, but also on that of the judges who have to determine upon its merits.

I therefore beg to suggest, and I do so with the greatest deference, that immediately upon the receipt of all the drawings by the committee, they should be thrown open to the public for exhibition, for at least one month previously to any decision being formed by the committee. This is a request (and I put it most respectfully) the profession have some right to expect would be acceded to, as they could then look with the greatest confidence to the ultimate decision of the committee, and it would be an evidence to the public of their disinterested motives; it would be also an honourable precedent for all future competitions in the kingdom; and, by the confidence which it would be sure to establish, be the means of calling together a greater number of the profession than any public competition hitherto known. What has lately taken place with regard to the Nelson Monument is an example that ought not to be thrown away; and, indeed, the eyes of the public are now beginning to be so opened by it that, sooner or later, I am convinced, not only a public exhibition of all the designs, but one previous to any premiums being adjudged or selection made will be established as a matter of course in all architectural competitions of any importance. The opportunity now presents itself to you of letting the town of Liverpool be the first to originate so exceedingly salutary a system—one fraught with numerous benefits to all parties concerned, but to none more so than those whose interest it may be presumed it is to obtain a design which shall have stood the test of such public ordeal, and obtained the greater number of suffrages from persons of experience and taste, and uninfluenced by other bias than the desire of obtaining such a structure as shall reflect credit on their townsmen. Among the minor advantages which would in this case attend such exhibition, would be, that it would attract numerous members of the profession, both from the metropolis and from other parts of the kingdom.

May I beg the favour of your laying this letter before the committee as early as possible, and trusting they will give some consideration to the observations which it contains, and waiting their decision,

I am, Gentlemen, &c.

Messrs. Deane and Harvey.

I again wrote the following:—

May 3, 1839.

Gentlemen,—A short time back I wrote to you respecting the public competition for the erection of St. George's Hall, Liverpool, and not having received any reply to that letter, I am again obliged to trouble you with a request that you will be kind enough to state whether the committee have deemed it of sufficient importance to take into consideration the subjects therein contained. I shall feel obliged by your reply within next week, as I am about publishing some observations of public competitions, and wish to name this amongst others in the course of those observations. I feel that it is necessary to apologise for giving you so much trouble, but on a subject of so much interest to the profession, and to the public at large, I am sure you will readily grant me an excuse. I am, Gentlemen, &c.

Messrs. Deane and Harvey.

And, after waiting without any reply, received the following:—

Liverpool: May 4, 1839.

Sir,—In reply to yours of the 3rd, we beg to state that we answered yours of March 9 on the 14th of the same month, and have not received any communication from you since, excepting your letter of yesterday.

If you will refer to our letter to you, dated March 14, we think you will find that we there answered all your inquiries; but if you wish any other information which it is in our power to give, we shall be most happy to afford it you.

We remain, Sir, your very obedient servant,

E. G. Deane,
Thos. Harvey, } Sec.

E. B. Lamb, Esq., Henrietta Street, Brunswick Square.

I insert this letter as a link in the chain, and to show the remarkable circumstance of mine not reaching its destination. The little hopes I had entertained of having my request acceded to were now fled; but as I still felt interested in the subject, I determined to write again, and send a copy of my letter of April 9. The letter accompanying that is as follows:—

May 7, 1839.

Gentlemen,—I received your letter of the 4th inst., and am greatly surprised to find that you have not received mine of April 9. As this appears to be caused by the neglect of the postman, or other person concerned in the delivery of letters, I purpose making inquiries at the General Post Office on the subject, particularly as the letter has not been returned to me—the course usually adopted when letters have not been delivered as directed. I send you a copy of the letter,

And am, Gentlemen, &c.

Messrs. Deane and Harvey.

This letter produced the following reply:—

Liverpool: May 8, 1839.

Sir,—In reply to your letter of yesterday, we beg to inform you that, upon further search, we find your letter of April 9 was duly received and laid before the committee, who came to a resolution, after much deliberation, that it was inexpedient to grant any extension of time. The other subject mentioned in your letter (the public exhibition of plans) is a matter for the future consideration of the committee.

We beg that you will accept our apology for the unintentional neglect of which we were guilty in not answering your letter of April 9, and also for the equally unintentional error which we committed in stating that it had not been received. It reached us by the same post as one upon the same subject from Mr. Donaldson, the Secretary to the Royal Institute of British Architects, and they were both laid before the committee without delay. Their determination was communicated by us to Mr. Donaldson, and we were under the impression that it had been communicated to you also, but it seems we were in error.

We trust you have had no further trouble about it, and remain, Sir, respectfully your most obedient servants,

Edw. G. Deane, } Secs.
Thos. Harvey, }

E. B. Lamb, Esq., 25 Henrietta Street, Brunswick Square.

It is certainly a singular coincidence that a letter which could scarcely be forgotten on an occasion of this nature, should happen to be so misplaced as to prevent its being answered, but I beg most distinctly to state that I perfectly agree with the writers that the neglect is unintentional; at the same time, I may with justice add that this sort of neglect is not an unfrequent occurrence with committees and their officers. Other instances might be named where plans have been laid aside and entirely forgotten by the committee.

I have now laid before you the usual kind of correspondence which takes place between architects and committees, and I think, upon the slightest consideration, it will appear who are the most benefited parties. I do not mean to impugn the Liverpool committee; I merely take them as a sample of the apparent openness and disinterestedness of such bodies. Can persons so constituted reasonably expect architects to enter into a competition when they withhold that evidence of their fair intention, which ought to appear, by not publishing their names to their papers, so that architects should be as able to form an opinion of their being fully qualified for their duties, as it should be evident to them that architects are qualified for theirs. In the present state of competition committees it is of small importance whether the architect wastes his time in bestowing deep study on his design, or merely commits to paper the most commonplace ideas, for the little knowledge of the subject usually shown by the judges is insufficient to discriminate between genius and mediocrity.

A copy of the advertisement having fallen into the hands of Harvey Lonsdale Elmes, he consulted the unfortunate Benjamin Haydon on the subject. "By all means, my dear boy," said the painter, "send a design; they are noble fellows in Liverpool. But let it combine grandeur with simplicity; none of your broken-up and frittered abortions, but something grand." Elmes worked in this spirit, and his design was selected. The following paragraph in a local paper suggests that it was approved because it was supposed to represent a cheap building:—

The successful design is, we believe, by Mr. Elmes, of London It is of very pure Greek architecture, the principal front being a portico of grand proportions, and enriched with bas-reliefs, on the execution of which, however, much depends. Perhaps within the limits of their resources (30,000*l.*) the committee could not have made a more judicious selection, the insuperable objection to many designs, from their extent and elaborate detail much more captivating to the eye, being that the expense of executing them would far exceed the funds at the disposal of the committee.

It is remarkable that after nearly fifty years the bas-reliefs which gave so much value to the design are not in their places. This competition was hardly settled when another took place for the Assize Courts, which were to be constructed at right angles to St. George's Hall. Here, again, Elmes was successful, the second prize going to Mr. Greig, of Liverpool. The decision was not accepted with unanimity, and a correspondent of the *Liverpool Albion* argued that the committee were led away by the beauty of the drawings, which, moreover, were "cooked." In the course of his letter he wrote:—

In Mr. Elmes's perspective drawing we have a very pretty picture, exquisitely drawn, showing the railway terminus on the one hand, and the assize courts on the other, with St. George's Hall occupying a prominent feature in the centre. With this picture it is very obvious the committee have been misled. It is a most successful deception. Now for the proof. The height of St. George's Hall is about 85 feet. The fall of the ground, in the direction of the courts, is 27 feet. The height of the courts at the lowest end is 76 feet. There should, therefore, be shown in the drawings a difference of 36 feet in their relative heights, but as the courts do not come to the extremity of the fall, say 32 feet. This difference, however, is most dexterously evaded, and leaves us to imagine the courts and St. George's Hall will be, to a spectator in the foreground, very nearly of one height. But this is not all. In this height of 76 feet is included a dead wall, rising 15 feet above the parapet of the colonnade. This wall is so much set back from the front that it could not be seen except at a considerable distance from the building. This, in effect, would rob it of 15 feet more, which, added to the 32 feet above, gives us 47 feet, or, in other words, taking as much height from it, within 3 feet, as goes to a five-storey warehouse. Let it be understood this is in relation to St. George's Hall, but in relation to itself this dead wall would practically reduce the height of the building to 62 feet, making the visual difference between the courts and St. George's Hall about 50 feet. The perspective drawing, however, does not in the highest degree convey this difference; but, in execution, this would be necessarily exhibited. Another example. The stylobate at the south-west corner is shown only 6 feet 6 inches high, whereas the real height is about 13 feet. Moreover, windows are shown in the plans which are omitted in the elevation, but had they been shown they would have spoiled the effect of the picture. More examples of this nature might be adduced, but let us come to the interior arrangements, for, after all, these are by far the most important parts to be taken into consideration; but it is very evident Mr. Elmes calculated on the incompetency of the committee to measure his perspective drawing and compare it with his plans. The event shows he was right. This gentleman, in the document attached to his plans, asserts that he has complied with the printed instructions, and that every apartment contains the full number of square yards required by them. His designs, however, show he has exceeded the limits by 36 feet in the length of the building, but this is concealed in the plan, and is only to be detected by carefully examining the section. His courts fall considerably short of the areas required, which were 290 square yards for the crown court, and 320 for the civil court; but the space given by Mr. Elmes is 231 yards for the former and 264½ yards for the latter, making a deficiency of 59 square yards for the one and 55½ for the other, making a total deficiency of 114 square yards out of 610; but there are two lobbies at the end of the courts, situated behind some columns, which, if he mean to include, would leave a deficiency of 74½ square yards. From this it is very clear the prize was not awarded Mr. Elmes for strict adherence to instructions, although he deliberately says he has done so.

It was even said that Elmes's design was copied from one made by Barry for the London Law Courts, at a time when it was proposed to erect them in Lincoln's Inn. In spite of all charges the desire for fair play upheld Elmes. Having succeeded in one competition against seventy-four competitors, and in the second against eighty-five, it was felt that a better man could hardly be found, and when it was resolved to make one building of St. George's Hall and the law courts, he was asked to remodel his designs in order to attain that end. He substituted Corinthian for Ionic and Doric, made other alterations, and insured the unity which every one knows. But Elmes was not destined to see the completion of his work. He fell into delicate health, and was advised to spend a time in one of the West India islands. He was a doomed man when he left England, but his end was hastened by a fall from a carriage. At the time of his death in 1847 he had only reached his thirty-fourth year.

CHURCH BROUGHTON CHURCH.

THE parish church at Church Broughton has been reopened after restoration. The following account is given by Mr. J. R. Naylor, architect, who was engaged in the restoration:—

William the Conqueror, in the year 1080, gave to Henry de Ferrers, among other lordships, that of Tutbury. This nobleman, for the glory of God, founded there a religious house, which he and his wife, Bertha, endowed with, among other gifts, the tithes of the manor of Church Broughton. It is probable that the monks of Tutbury Priory built the first church here, some parts of which still remain. The easternmost respond to north arcade, with its cap and base, and the bases and shafts to three piers on north side of nave, part of a buttress on the south side, and the foundations of the angle buttress at west end, are all of this date and *in situ*. The church had an oblong nave, 34 feet by 18 feet 3 inches, with a north aisle and chancel, both of which had apsidal terminations.

The font belonging to this building, which still remains, is one of the finest examples extant of Norman workmanship: it is circular, 2 feet high, and 2 feet 6 inches across the top. The pattern with which it is ornamented is remarkable, and consists of interlacing triangles and circles symbolical of the Trinity and Eternity (see "The Churches of Derbyshire," by the Rev. J. Chas. Cox). In the centre of the eastern face as now fixed is a cross with Greek head, the whole being in a wonderful state of preservation. The church has at different stages undergone many alterations, each one adding an interesting chapter to its history. The first development was in the early thirteenth century, when a flat east end was built to the north aisle; also a south aisle was built with entrance to church from this side, the original entrance being at the west end.

In the fourteenth century, probably the reign of Edward II., the present chancel was erected with its beautiful tracery windows and canopied buttresses, also priests' door, sedilia and piscina, forming one of the most harmonious and complete examples of this style in the country. I must make special mention in connection with the chancel of the small trefoil glazed opening on the south side; this is in its original position, and is fixed to the face of the chancel wall with no internal reveal at all. During the restoration some

parts of the walling over this opening had to be rebuilt, when an arch was discovered in the thickness of the wall, the outer edge of which had been roughly chopped off (leading to the conclusion that this was continued, and formed the vaulted roof of an anchorite's cell, from which a view of the high altar could be obtained). There is a good deal of interesting study for the archæologist in this corner of the church.

The very beautiful recess on the outside wall, with an ogee arch moulded and cusped, the label to which terminates in a floriated cross, the whole standing on a slab with front of sunk quatrefoil panelling, I consider to be of the same date as the tower. Over this recess, which is generally, and perhaps with truth, called the Founders' Tomb, though never utilised for that purpose, is a three-light Late Decorated window, with transom and traceried head. This is of decidedly domestic character, and was possibly brought here from Tutbury, the window originally in this position being like the others on same side of chancel, and when taken down the head was fitted to jambs of earlier date, and now completes one of the south nave lights.

The building of the tower and spire formed the next stage in the work, and as this took some considerable time the rest of the church was left intact, so that the services could be carried on without interference, and these building works proceeded independently till the whole was completed, including the westernmost arch of north and south arcades. The west wall of original church was then removed, and the junction between old and new parts of the church effected in the somewhat clumsy manner now seen. The new arches on north side and the arcade on the south belong to this date. The present south entrance is interesting, inasmuch as the jambs belong to this date, and were built with the tower, but the arch is the old one removed from the early thirteenth century door in the centre of this aisle.

To follow the church's history still further. In about 1506, in the reign of Henry VII., the original pointed roof of nave (see line on tower) needing extensive repairs was removed, and the present flat one substituted. This opportunity was taken to raise the walls over the arcades, but what clerestory lights were inserted must remain a matter of conjecture. I think not the present ones, as these are not set out in any way to fit with the principals of the roof; in fact, one came about centrally with a window, so having no support at all for its wall bracket.

I do not consider that the chancel roof was altered until 1727, when the present one was put on. The clerestory lights in the nave were also inserted about this time. The old chancel arch was remodelled and lowered, and plaster members both to arch and jambs were formed on the old stones. The bells are dated 1610, 1614, 1810, and occupy a beautiful chamber, vaulted, and with ribs and carved corbels.

In 1846 the church again underwent important repairs and alterations, the north aisle was rebuilt, and all its interest lost. Both aisles had new roofs. The porch was added, old doors and ironwork destroyed, the floors throughout the church were raised about 2 feet, entirely spoiling the proportion of the building. The old oak pews were taken out and modern pews of stained deal introduced. The taking away of the old oak we must regret, as every mark about an old building forms part of the history of the fabric, and, except under very special circumstances, ought in no way to be tampered with. This applies in the strongest possible way to all work of any kind introduced prior to the commencement of this century.

I must here record a special protest against the abominable practice of tooling by unpractised hands the paint and whitewash off church walls. Only a short time ago I found an old mason "set on" to clean one of the most interesting churches in Yorkshire, and I can assure my readers that his ideas and actions, against which I most indignantly protested, and with some effect, were such that all in any way interested in the marks of our forefathers and the history of our land must deplore most earnestly.

Early in 1885 the state of the tower and spire was such as to give great cause for uneasiness to the custodians of the fabric, and at the meeting of the parishioners it was decided that a professional expert should be called to advise on the best course to pursue. The committee engaged the services of Mr. J. R. Naylor, of Derby, diocesan surveyor, who made a careful examination of the tower and spire, when it was found that the ivy which formed such an ornamental feature was the cause of the whole mischief. It had forced its way to such an extent into the joints of the masonry that the spire was actually being displaced by it. It had also forced the parapets of the tower out of the perpendicular—in fact, to such extent that it was found advisable to take down and entirely rebuild them. The lead-work of gutters was also forced out of position, and the water did great injury to the tower walls.

The committee decided to carry out the works proposed in Mr. Naylor's report, and in addition to thoroughly restore and re-point the whole of the tower and spire, carefully removing every particle of the ivy. This has been done, and the whole re-pointed and thoroughly repaired, no old work being in any way removed or tampered with. The vicar (the Rev. W. Auden) then decided to restore the chancel, and take upon himself the responsibility of providing the whole of the funds necessary. This work has included the rebuilding of some part of the east end and resetting the tracery of windows, repair of all decayed and defective masonry, lowering and replacing floors at the original levels; cleaning walls by washing, no tools being used; reseating in oak, new altar and tile floors, the panelling from old chantry screens being used as reredos. The chancel arch and the wall over were cleaned from plaster and whitewash, when it was found that the original arch was much higher than that then existing. It was determined to rebuild on the old lines, using all the old mouldings and stones that were in any degree perfect. This has been effected with great success, the boldness of the original design being strikingly apparent. The committee and other friends, seeing the effect of the work going on, decided to make a special effort to restore the nave in character with its extremities. This has been completed inside and outside. The whole has been cleaned from paint and whitewash, the arcade made safe, mouldings repaired and replaced where wanting, floors lowered, seating throughout in oak, and new floors of wood blocks introduced.

The contractors employed for the work have been Messrs. Walker & Slater, of Derby. The heating was carried out by Mr. Jerram, of Derby. The wrought-iron altar rails by Mr. E. Haslam, and the carving by Mr. E. Bridgeman, of Lichfield. The chancel tiles were supplied and laid by Messrs. Godwin & Sons, of Hereford, and Messrs. Jones & Willis, of Birmingham, supplied the altar cloth and altar desk (the gift of Miss Sampson in memory of her father), while the brass pulpit desk is the work of Messrs. Hart, Son, Peard & Co., of London.

LEGAL.

High Court of Justice.—June 30.

(Before Mr. Baron Huddleston and a Special Jury.)

Kerr *v.* Sandys.

ARCHITECT'S FEES.

This action was brought by Professor Kerr to recover the sum of 1,341*l.* from Lieutenant-Colonel Sandys, for services rendered in preparing plans and making out bills of quantities for reconstructing the mansion house of Graythwaite, in the county of Lancashire, belonging to the defendant. The defendant contended that the charges were excessive, that it was not his immediate intention to carry out the plans, and therefore no bill of quantities was necessary, and should not have been charged for. Shortly before trial the defendant amended his defence by further pleading that the working plans, drawings, and bills of quantities were not properly prepared, and were wholly useless and different from the plans and bills of quantities which the plaintiff agreed to prepare or obtain for the defendant. The defendant paid 750*l.* into Court as sufficient to satisfy the plaintiff's claim.

The plaintiff, called and examined, said:—In 1882 I communicated with defendant with regard to his house on Windermere Lake. The defendant was to pay me what he pleased for a report. I was asked to visit Graythwaite on April 12, 1882. I looked over the old house and considered building a new house, stables, &c. I was authorised to prepare a plan for remodelling the old house and for building a new house. I made my first report on October 27, 1882. Between April and October there were distinct schemes prepared. On February 5, 1883, the defendant called upon me and expressed his satisfaction with my drawings and reports, and thought 20,000*l.* would cover the outlay on house, stables, new approach, and two lodges. He called again, and brought a sketch by Mr. Gregory to amend my plan. This was an entirely new scheme; it was proceeded with by me and my clerks. On August 17, 1883, defendant called upon me; he considered plans and alterations; they are the plans as modified by Mr. Gregory, which were to be finally completed. On November 3, 1883, the defendant called upon me; we went through all plans; defendant was pleased with plans. The defendant said he wanted the plans to be deposited with his banker so that they might be carried out by his successor in the event of his decease. The defendant was to deposit an estimate upon which his successor was to proceed. On February 20, 1884, the defendant called again; I said I should call in a surveyor to assist me in preparing a bill of quantities. I told the defendant that the estimate of 14,680*l.* was a cube estimate only, and unreliable, and that we should make a reliable estimate only by a bill of quantities, which would only be in an abbreviated form, and so cheaper. I employed Mr. Houghton to prepare the quantities. On October 30, 1884, defendant called upon me, and was satisfied with my explanation of the bill of quantities. On January 15, 1885, my final report was sent in dealing with gross estimate of 29,000*l.* The report explained that it came down by deduction to 20,000*l.* I sent in my charges at the same time as the

report. The defendant replied objecting to my charges. The difference in my charges is accounted for by reason of the omission to include excavation. I charged 3 per cent. on estimate, ¾ per cent. for excavations, ¾ per cent. for extra plans, and ½ per cent. for duplicate set desired, making 5 per cent. upon whole estimate. I charged nothing for alterations.

Cross-examined: The bills of quantities were not sufficient to enable builders to compete, but were sufficient for one builder to make an estimate upon. In the claim, ¾ per cent. is for the bill of quantities. The increased amount charged is taking into account the excavation.

Further evidence was called to show that the charges were fair and reasonable; but, upon an intimation from the jury, counsel for the plaintiff elected to take the case no further.

SCHOOL BUILDINGS.

Chelmsford.—A new National school for boys has been opened. The building was designed by Mr. Fred. Chancellor, of Chelmsford, and the contract for the erection was taken by Mr. George Saltmarsh, at 1,422*l.* The building is of red brick, with slated roof and half-timbered gables.

Stockport.—New day and Sunday-schools have lately been opened at Edgeley, Stockport, to accommodate 800 scholars. The building, including boundary wall and entrance gates, will cost about 3,500*l.* The architects were Messrs. Willoughby & Woodhouse, of Manchester and Stockport, whose design was selected in competition.

Redruth.—The new schools at Trewirgie, which are just completed, justify the judgment of the Board in the selection of the design of Messrs. G. B. Nicholls & Son, London and Birmingham. They are a fine example of school planning and building, and great credit is due to the builder, Mr. Arthur Carkeek, of Redruth, for the able manner in which he has carried out the work. The schools have won universal approval, and the Government Inspector, Mr. T. King, has expressed himself highly pleased with them. The group of buildings are unfortunately in such a position as to be almost hidden from view, but it was the only site obtainable by the Board. It was anything but suitable for such a purpose, being so irregular in shape and levels. The schools are planned for the accommodation of 350 boys, 175 girls, and 175 infants, with the necessary classrooms, cloakrooms, and lavatories, arranged in the most complete manner, not only for working, but for being under the inspection of the teachers without any inconvenience. The several rooms are admirably proportioned, and the diffusion of light is perfect. The ventilation is skilfully carried out to admit of a free circulation of fresh air and for the escape of the vitiated air, obviating the effects of cold currents and down draughts. The most noticeable feature in the interior of the buildings is the construction of the roof and ceilings. All the rooms are partly open timbered and the ceilings close boarded, which impart a warmth and cheerfulness which greatly add to the lighting and the acoustic requirements. A dado is fixed round all the walls to the height of the windows, and the floors are paved with wood blocks. The desks, galleries, and fittings are of the most approved description, and the whole of the finishings are of a unique and substantial character. The exterior of the buildings is marked by a boldness of outline developed upon the constructional lines of the building, without any superfluous ornamentation. Mr. W. Whetter was the able clerk of works.

CHURCH BUILDING AND RESTORATION.

Leicester.—The mission church of St. Faith has been opened. The church will seat about 300 persons, and has cost about 1,600*l.* The architect is Mr. H. M. Townsend, of Peterborough, and the builders are Messrs. H. T. & W. Chambers.

Blackburn.—The church of St. Barnabas has lately been opened. Owing to the limited space the architect has been obliged to bring three sides of the church close to the street line. The plan of the church consists of nave, side aisles, transept, organ chamber, choir and clergy vestries, and two porches, giving entrance to the church from Addison Street and Belle Vue Street. A separate entrance to the clergy vestry is provided from Johnston Street. Owing to the great fall in Addison Street a schoolroom has been obtained under the church for the accommodation of upwards of 200 scholars. Under a portion of the schoolroom is a large heating vault and stoves for fuel, &c. The church provides accommodation for 722 persons, two-thirds of the seats being free. The external walls are built with Yorkshire pierpoints in irregular courses and ashlar dressings to doors, windows, &c. The internal walls are plastered and prepared for decoration at some future period. The whole of the roof timbers and benches in nave, side aisles, and transept are made of selected pitch-pine and varnished. The choir benches, pulpit, communion-table, chairs, and rail are made of oak. These fittings, and also the font, which is made of Caen stone, with marble shafts, have been supplied by Messrs. Jones & Willis, of London and Birmingham. The aisles and passages in the nave, side aisles, transept, and floor of the organ chamber are laid with pitch-pine blocks in pattern, and the floors of the chancel and sacrarium are laid with oak blocks in two shades of colour and also in pattern. This work has been executed by Messrs. Geary & Walker, of Manchester. Great care has been taken in ventilation and warming, the latter work being accomplished by means of hot-water pipes on the low-pressure system, provided by Messrs. Mercer Bros., Blackburn. The artificial lighting is by means of iron and brass gas brackets, standards, and coronas, from the works of Messrs. Dutton & Powers, of Manchester. The contract has been carried out by Messrs. Marshall & Dent, builders, of Blackburn, their sub-contractors being Mr. Thomas Arkwright, mason; Mr. Maudsley, slater; Mr. John Shaw, plumber and glazier; Mr. Edward Billington, plasterer; Mr. Pickup, varnisher and painter; Mr. John Dean, tiler; Messrs. Mercer Bros., for railing, gates, and hot-water apparatus; and Messrs. Homan & Rodgers, of Manchester, for fireproof flooring. The carving has been executed by Mr. Gregg, of Darwen. The design was prepared by, and the church has been erected under the superintendence of, Mr. Wm. S. Varley, F.R.I.B.A., architect, Blackburn, at a cost of upwards of 6,000*l.*

Liverpool.—The memorial-stone of the church of St. Benedict, Heyworth Street, Everton, has been laid. The building is being carried out in Crosby bricks, with Ruabon bricks for all mouldings and salient parts, and a sparing use of terra-cotta, supplied by Mr. Edwards, of Ruabon. The church will accommodate 700 people. The contract price is 5,314*l.* The architects are Messrs. Aldridge & Deacon, of Queen Insurance Buildings, Liverpool. Mr. Hugh Yates is the contractor and Mr. T. Hallam the clerk of works.

Mortomley.—The new Catholic church and schools erected by the Duke of Norfolk at Mortomley, near Chapeltown, have been opened. The foundation-stone was laid on July 26, 1885, by the Bishop of Leeds, on a site near Mortomley Hall. The buildings consist of church, school, presbytery, and house, provision being made for future extensions. The architect was Mr. Edward H. Lloyd, of 37 Great James Street, Bedford Row, W.C.

GENERAL.

A School of Art is proposed for Malvern, and a committee has been appointed to report on the scheme.

Mr. F. Litchfield has arranged for exhibition at his house in Hanway Street, W., a valuable loan collection of old English porcelain, containing very rare and beautiful specimens of the Bow, Bristol, Chelsea, Derby, Leeds, Nantgarw, Wedgwood, Worcester, and some other factories of the last century.

The Birmingham Students of Art have issued the fourth number of the *Art Student*, which is highly creditable both in respect of the illustrations and matter.

The Annual Art Exhibition at Southport, which closed on the 19th ult., has proved a financial success. The sale of pictures resulted in a total of 3,517*l.*

The Committee of the Dublin Technical Schools have acquired possession of buildings in Kevin Street for the purpose of establishing schools.

Plans prepared by Mr. A. Loader, architect, of Brighton, for the cemetery to be constructed at New Shoreham, at a cost of 2,000*l.*, have been approved by the Burial Board, and the works will be carried out under Mr. Loader's supervision.

The Painted Windows, in the Scotch Church, Rue Bayard, Paris, which cost about 500*l.*, have been maliciously destroyed. The windows were given by Americans in memory of friends who had died in Paris.

The State Capitol at Albany has already cost 17,500,000 dollars. So large an expenditure was partly caused by the changes in the superintendence of the works.

The Board of Management of the Huddersfield Infirmary have requested Messrs. H. Saxon Snell & Son to prepare designs for the enlargement of the building, and also a report as to the sanitary condition of the premises generally.

The "Ipswich Journal," a long-established paper of the Eastern counties, commenced a daily issue on the 1st inst. (yesterday).

Southampton of the Seventeenth Century was reproduced at a fancy fair held last week in Southampton, in aid of the Vicarage building fund.

The Annual Excursion of the Glasgow Architectural Association has lately been made, when Dunblane and Stirling were visited. At Dunblane the cathedral was sketched and measured in various parts, and the whole building thoroughly inspected, after which the party journeyed to Cambuskenneth and saw the old tower, arriving in Stirling by six o'clock. After tea, the castle, Argyle's lodging, east and west churches, &c., were visited.

The Architect.

THE WEEK.

The meeting which was held by the Hellenic Society, for the purpose of continuing the controversy between Mr. Penrose and Dr. Schliemann, was little more than one of those irregular movements which learned societies excite in order to show that they are alive. It was impossible for anybody who had not visited the explorations at Tiryns to decide whether the masonry which, according to Dr. Schliemann and his coadjutors, was prehistoric and formed part of the palace of a Homeric chief or belonged to a later period. The value of the papers which were read depended on the experience of the writers, and accordingly Mr. Penrose's argument was entitled to most reliance, for he has had more experience in building than his opponents. But until photographs on a large scale are available it will be useless to make assertions on either side. Mr. Penrose says the walls of the building unearthed at Tiryns are built generally of small stones, and the bricks must have been burnt in a kiln. Dr. Schliemann is convinced that the appearance of burning is owing to conflagrations which affected the walls *en masse*. We are as far as ever from being certain as to whether moist clay mortar was used, or whether the stones were piled without a connecting medium. The explorer naturally sets a high value on the plans which are in his last book, and he is proud of the opinion passed on them by the late James Fergusson, who described them as "masterpieces of architectural skill." The value of Mr. Fergusson's opinion on plans will not count for much with anyone who has seen his attempt to restore the Erechtheum. Professor Jebb is not fascinated by masterpieces, and finds the plans do not correspond with the Homeric description. Dr. Schliemann has travelled all the way to Burlington House to support his book, but, in spite of the interest attached to his presence, the controversy would have been as much elucidated if he remained in Greece.

The French Government have purchased this year fifty-four paintings, three drawings, and twenty-four works of sculpture from the Salon. The paintings are of all kinds—figure pieces, portraits, landscapes, flowers, &c. Among the acquisitions are the *Bataillon Carré*, 1815, by M. Protais; *The Submission of Vercingetorix*, by M. H. P. Motte; the fine decorative work, *Lorraine and its Illustrious Children*, by M. Monchablon; the *Pain beni*, by M. Dagnan-Bouveret; the *Portrait of M. Pasteur*, by M. Edelfeldt; *The Confrontation*, a scene from the Franco-German war, by M. Emile Boutigny. It is not stated how much was paid for the several pictures.

M. Goblet, the French Minister of Fine Arts, has asked for a vote of 48,142 frs. to pay for the pictures by the late Alphonse de Neuville, which had been purchased at the sale of the painter's property. Four works were purchased, viz., *Le Parlementaire*, for 20,000 frs.; *Le Bourget*, for 15,000 frs.; *Attaque de Villersexal*, for 10,000 frs.; a drawing, 850 frs. The balance represents the commission in connection with the auction.

The Salon exhibition of this year has been a success for the Society of French Artists. During the fifty-six days on which the galleries were open there were 372,000 visitors, thus exceeding by 30,000 the number for last year. It is estimated that the sum obtained will amount to 330,000 frs., and when all expenses are paid there will be a sum of 240,000 frs. added to the funds of the Society.

The Society of Arts has not entirely relinquished the placing of porcelain tablets on the fronts of houses in London which were occupied by notabilities. Since the last announcement the following have been set up:—On 263 Hampstead Road, George Cruikshank; on 11 Bolton Street, Piccadilly, Madame D'Arblay (Fanny Burney; on Furnival's Inn, Charles Dickens; on Schomberg House (now part of the War Office, Pall Mall), Thomas Gainsborough. There are now twenty-four of the memorial tablets on houses in London, and the Council of the Society will be glad to hear of any more houses of the class where the owners would permit the erection of tablets.

The arrangements for designing the Tower Bridge are not satisfactory to Colonel Haywood, who may be described as the city engineer. Twenty years since he formally proposed the erection of a bridge near the Tower as a means of accommodating the increased traffic. But the remedy which found favour in the eyes of the Corporation was the widening of London Bridge, a scheme which moved some of the Academicians into opposition. When the Bill was before the House of Lords, Colonel Haywood was one of the witnesses against it, and we suppose so much independence will never be condoned. At any rate, when the Corporation were forced to fall back on the Colonel's proposal, he was not asked to take a part in its realisation. Preference was given to the City Architect, who was converted from his opposition to a bridge near the Tower about the same time as the Corporation. It is generally believed that the City authorities are exceptionally generous in their dealings with their high officials, and, in justice, there should be some recognition of Colonel Haywood's services as a pioneer in preparing the way for the new bridge.

The Council of the Union Centrale des Arts Décoratifs have decided to refrain from holding a general exhibition in Paris until 1889. It is supposed that three years hence the new museum will be ready, and it could not be inaugurated in a worthier manner than in connection with an exhibition of ancient and modern industrial art.

A circular has been issued by the Lord Provost of Edinburgh and other gentlemen, soliciting support towards the cost of erecting a medallion of Sir Walter Scott in Westminster Abbey. It will hardly be credited that a sum of 101*l.* 1*s.* has to be paid to the Dean and Chapter for the privilege of placing a medallion against one of the walls. When that is the price for wall space, we cannot understand what the authors of the circular mean by saying that the Dean would heartily receive the memorial, and specially desires to give it a site in Poet's Corner—indeed, an excellent site, considering that less than a hundred guineas is to be paid therefor. There will be no difficulty in raising the money; but what is the advantage of the memorial? Scott's fame will not be enhanced by a medallion in Poet's Corner. So many of the names inscribed there are of men who have passed into oblivion, it is not a desirable place for an author whose books are universally admired.

M. Charles Stier has presented a few interesting works to the Egyptian collection in the Louvre. One is a life-size figure of a hound in black basalt, which is unique. It is supposed to be at least three thousand years old. Another work, no less interesting, is the head of an Egyptian steward in granite. Portraits of the kind are mostly in bas-relief.

The Mont St.-Michel on the Norman coast contains a church and monastery, both of which are most interesting. The lease will expire on August 30, and the French Government decline to renew it to the missionary priests who have occupied the buildings during several years. It is not explained why so arbitrary a course should be adopted. There is no doubt that costly works are needed for the preservation of the buildings against the sea, but it is not evident how occupancy could interfere with them. If it is proposed to make the buildings a mere place of show, they will lose much of their interest when only bare walls are seen. Up to this it was possible to form a good idea of what the place must have been four or five centuries ago, although armed men no longer took part in the services. But if the Government adhere to their resolution, the Mont will be as dreary as the Panthéon since it was converted into a casket for Victor Hugo's coffin. A visit to the hill of St. Geneviève would give the Minister a lesson on the consequences of disestablishment as seen from the standpoint of the picturesque.

THE TRAGEDY OF ART.

[By a Correspondent.]

In tracing the history of a family under the Second Napoleonic Empire, and in following the ramifications of the branches of the genealogical tree which he devised, it was to be expected that sooner or later M. Zola must have something to say about the representatives of the Rougon-Macquarts in art. For art in France is almost as widely related as the army. Accordingly in his last book we have the story of the unfortunate Claude Lantier, the painter. The son of a "ne'er-do-weel," there is no knowing what he might have turned out if he remained in a country town. But he was adopted by an amateur of paintings, who, on dying, left him forty pounds a year, with power to dispose of the capital when he reached manhood. M. Zola is a believer in the doctrine of heredity as it is laid down in a book by Dr. Lucas, and we must suppose that some drops of the virus of the Lantiers circulated in the veins of Claude, and mingled with the good blood he derived from the honest washerwoman who was his mother. He had the qualities which go to the making of a noble as well as a great man. There was nothing mean or selfish about him (unless his devotion to art could be called selfish); he was courageous, self-sacrificing, and inspired by lofty motives. But as Othello exclaims, "Who can control his fate?" In this case we find the individual will, with all its strength, was not able to cope with a disordered condition of the fibres of the brain. The imagination with which he was endowed increased the power of the evil that was hereditary. Chaos seemed to return with its shapes of terror, life became a nightmare, and the ill-fated painter was deprived of his power of volition. The end of the tragedy is suggested at the beginning of the book, when it is said that Claude as a child was feverous with a love of painting. According to the joyous Clive Newcome, "Art ought not to be a fever, but a calm—a temple for placid contemplation." With poor Lantier the fever was life-long, and at length he was consumed in it.

It is sometimes said that M. Zola is indifferent to literary art. In "L'Œuvre" we have an opening that seems borrowed from "Macbeth." The story begins with thunder, lightning, and rain; but, instead of a blasted heath, we see the Quai Bourbon in Paris, which is within a stone's-throw of the Morgue. There, in a garret of one of the old houses, Claude Lantier lived and painted. Like so many tenants of confined domiciles, he was wandering through the streets when the storm burst. He returned quickly, and, as he was about to enter the house, the lightning revealed that a woman was crouched in the angle of the doorway. The only women he knew were models, and from them he was not likely to learn much courtesy. But he was unable to turn this unknown wayfarer (her name was Christine) adrift on such a night, and, with a good deal of *brusquerie*, he offered her the shelter of his studio.

It was not at all a luxurious place; it was dreary, like the ateliers of most artists who have not made a name. M. Zola is not the man to indulge in picturesqueness which does not exist, although by doing so he will satisfy the desires of novel readers. Many a romance has been made attractive with suppositious scenes of artistic life in Paris, and people have persuaded themselves that it was delightful. The life of a young artist in that city, according to Thackeray, was "the easiest, merriest, and dirtiest existence possible." Whether that was true of the year 1840 we do not profess to know; it certainly is inapplicable now. How an artist's life could at any time be easy is not plain—Thackeray's failure was a proof of the contrary—and the days for merriment in art or in anything else seem to have vanished. M. Zola endeavours to be as rigidly accurate as if he wrote for the enlightenment of statisticians, and the life which Claude leads in his garret strikes us as drawn from reality. Everyone who is acquainted with the insides of studios will be able to testify to its accuracy.

Lantier, it appears, was engaged on a large picture which might be described as a modern version of the famous *Idyll* by Giorgione in the Louvre. The principal figure was a nude woman lying on the grass in a wood, which was illuminated by a summer sun. To obtain a contrast of colour a man was introduced—his back being towards the pectator. His schoolfellow, Pierre Sandoz, a young writer (who is plainly a counterfeit presentment of M. Zola himself), posed for the cavalier in velvet. When he came, about noon, he found Claude hard at work. During the whole morning his food had been a few mouthfuls of dry bread and a little chocolate, which he drank out of the saucepan. Claude was in a mood for painting, and neither hunger nor the entreaties of the friends who afterwards dropped in could induce him to leave the easel until it was no longer possible to see. Then, as he was going out, he took a final look at his canvas; the day's work dissatisfied him, and the head and throat of the figure, which cost him so much pain, were ruthlessly scraped out. This fastidiousness, which is never satisfied, was one of the characteristics of Claude—as of all great painters until they sell themselves to Mammon—and it was the cause of the final catastrophe. Yet prudes would say of him that he was pandering to a debased taste and must be a sybarite. There is not much luxury to be found in a garret, where life has to be supported on the dry loaves of Paris, varied by insufficient meals at a restaurateur's, and where the days are spent in alternately painting in and painting out. A Carthusian would be likely to say it needed more self-denial than the *régime* of a convent cell. There are, however, many painters in Paris who have to endure for years privations which a bricklayer's labourer would consider unendurable, and the "easiest, merriest life" of the romancists has a strange sort of signification with them.

It will be asked what becomes of all the money which is received for the pictures? M. Zola gives us a glimpse of how painters of Claude's age and rank are rewarded. Père Malgras, the picture-dealer, who, by a kind of instinct, knew where rising men were to be found, occasionally visited the garret on the Quai Bourbon, and was in the habit of paying ten francs for sketches which appeared remarkable. On the occasion in question it was a landscape which attracted his eye. Claude was not in the best of humours, for he was trying to grapple with the difficulties of his big picture, and he insisted on a larger price. The dealer had to disburse the munificent sum of fifteen francs. The worthy patron of the arts then proposed to bring a real lobster, in order that Claude might paint a piece of still life, and was willing to accept the picture in return for the delicacy. This mode of doing business would be called generous if compared with the practice of some dealers. Young folks are supposed to be able to suffer—artists are always merry—and, as M. Zola says, what would become of good-for-nothing painters if, from time to time, such benefactors as Père Malgras did not convey to them a leg of mutton, a brill, or a lobster enshrined in parsley?

Fortunately art is often the reward of its votaries. Claude Lantier had the consciousness of being one of the apostles of a new creed in painting. He was in revolt against academicism, with all its works and pomps and inanities. If he could muster twenty francs he was able to study the nude without restriction in the studio which had been set up by old Boutin, the model. There, in his eagerness to depict what was before him with the firm hand which is inspired by power, he was accustomed to forget eating and drinking, and in his concentration be indifferent to the opinions on his works and ways which were uttered by young gentlemen who followed the orthodox courses. Then, among friends who were in accord with him, he could prophesy about the days when there would be no conventional laws to put down all attempts to represent figures in the open air in the strongest sunlight; when honest realism would be respected; when railway stations, markets, mairies, and buildings, where men congregate, would have their painted decoration; when, instead of repeating stereotyped things, painters would seek their subjects in narrow lanes as well as in boulevards; when the lives of poor as well as rich would be thought worthy of representation, and the present in all its multitudinous aspects would be painted for the sake of its inherent interest. Having the militant spirit as became the champion of a new cause, he was able to look on Paris as a battle-field where sooner or later he was destined to be victorious. But it was no selfish dream. His friends were also to wear laurel crowns, for each of them in his own line was struggling against the old-world notions. With one, Wagner was worshipped because he did not hesitate to massacre the conventionalisms and ineptitudes which passed for classicism in music.

In describing Claude and his friends, it is evident that M. Zola occasionally revives reminiscences of his own youthful days, when he fought a good fight for the recognition of individuality in art and literature. As he looks back, we can see that he makes light of the inconveniences which arise when one's income is to be calculated on the basis of ten francs per picture sold and delivered. For he feels that youth is by itself a treasure. Lord Chancellor Clarendon could find no more severe mode of punishing the impertinence of the Court beauty than by reminding her that she also was to be old. For the poet and the artist, no less than for kings' favourites, youth is a golden prime. Béranger expresses the pain they suffer afterwards when, thinking of his garret and his twenty years, he said :—

> Dreams of my joyful youth ! I'd freely give,
> Ere my life's close,
> All the dull days I'm destined yet to live
> For one of those !

The truest stroke in M. Daudet's "Sappho" is in the scene where the great sculptor is taunted with being no longer young. His arm is as vigorous as ever, his intellect has grown clearer, his figures show that his genius is like his arm, but he writhes under the sting of the words as if they were a poisoned arrow. And M. Zola, who is anything but a sentimentalist, is compelled for the sake of accuracy in his picture of artist life to introduce the famous painter Bongrand, Member of the Institute, Officer of the Legion of Honour, and what not, whose only enjoyment was when he was allowed to join a party of young fellows. "It is well to be you, at the bottom of the hill," he remarked with sadness ; "one has always good legs and a stout heart when one has to climb. You may laugh at me, but some day you will feel as I do." As he left the little party his eyes were softened, and they heard him say, "Oh, youth, youth !" It is like the wail which runs through Thackeray's later writings, and which obtuse folks ascribe to affectation. When Claude visited the old man in his studio, Bongrand was pleased with a word of commendation of the picture on which he worked. "There are days," he said, "when I begin to doubt if I am competent to draw a nose. I have at once too much and too little of the critical power." He expressed the opinion that a painter ought, out of respect for his reputation, to strangle himself in front of his last *chef d'œuvre.*

But meanwhile the picture which seemed to be attempted in rivalry with Giorgione (like Turner with Claude Lorraine) was far from completion. Claude had sketched the head and neck of the woman he met at the door on the night of the storm, and when introduced in his picture he saw that the rest of the figure was not in keeping. One part or the other must be sacrificed. A difficulty of this kind must always be expected as an accompaniment of realistic attempts. If a painter of the school could envy Raphael, it would be for the liberty possessed by the great painter, who was able to say, "When I have not before me a model that is satisfactory, I then serve myself with a certain ideal of beauty which is in my mind." As the time for reception at the Salon drew nigh, Claude's difficulty became a torture. The more he altered the more the disparity became evident in his eyes. At last, when only three days remained, and he was debating whether the work should not be abandoned, he made a despairing appeal to Christine to offer a supreme sacrifice and pose for the whole figure. Out of pity and pride she consented.

M. Zola is writing of the exhibitions which prospered under Imperialism, and in which everything that was individual or lifelike was proscribed. Claude was treated exactly like Manet, Brigot, and Courbet. His picture was relegated to the Salon des Refuses. There were some artists who could admire so much realism, and Bongrand declared he would give ten years of his life to be able to say that he produced such a work. But the public could not understand the qualities which excited the old painter. The picture was taken to be a sort of pictorial joke, and was considered a very bad attempt in that line. All day long people were laughing in front of it, and the Scripture piece near it with figures that seemed cut out of wood was not more derided. It was in that way Edouard Manet, the founder of the realistic school, was treated some twenty years since. He was hissed and hooted—one of the finest of Parisian gentlemen was taken to be a rough, and, so to speak, was pelted with mud and stones.

It is not surprising that Claude should be tempted to flee from the city which seemed ready to stone its prophet. For a time he tried the experiment of "love in a cottage," and assumed a *rôle* for which he was not adapted. But he could not remain for ever untrue to himself. A visit to the Salon a couple of years afterwards moved his whole being. He thought it was time for a picture to appear which might startle the imbeciles. And Christine, his companion, felt that destiny was too strong for her, that she and he must return to Paris, although it was to meet their doom.

But of what kind was the picture to be which was to scare the Academicians like the handwriting on the wall ? In the first place it was to be large, measuring about twenty-five feet by sixteen. Then, as was natural with a man who had lived near the river, he proposed to himself that it should be a scene on the Seine. For long months he spent his days under the arch of one of the bridges, making studies of the busy scene which was before him. Here plaster was being landed amidst light clouds of white dust, and there cylinders of dry wood for burning. A swimming-bath was available for one side, a lavoir or floating washhouse, with its crowd of busy women, for another. A subject of this kind, so full of life, with the buildings of the oldest part of the city in the distance, and the clear sky of Paris above, was enough to absorb the powers of a giant if he wished to do it justice, and henceforth Claude had no thought for anything else in this world. But there was something still wanting to satisfy a man who knew that the rendering of the nude was alone worthy of a painter's utmost efforts. Every painter, let him be ever so realistic, cannot help thinking that, after all, one thing may be a symbol of something else, and Claude wished to have a better personification of Paris than riverside labourers carrying bags or a row of women beating and rinsing underclothing. Allegorical figures of virtues and vices were effete. He could think of nothing better than a boat in the centre of the picture, to have one girl in a sort of bathing costume at the oars, another seated on the side with her feet dangling in the water, while a third stood in the prow like Venus when she rose from the sea. The meaning of it was occult to all but the artist.

It would have been well for Claude if he realised that everything done by a painter was as typical as his figures. What paints dug out of the earth can ever be made to look like flesh, light, air or water, like leaves or flowers ? Every picture resembles the cloths which were hung in the Elizabethan theatres, inscribed with the words Athens, Rome, or London. With Turner and Titian, as well as with them, we must "piece out the imperfections with our thoughts." The opaque colour has to stand for transparency, a trick of contrast for the sheen of light. Every day when Claude went to the bridge he saw a new beauty in the river scene ; to his eyes it was whimsical in its variations, and when he returned to the shed which he used as a studio there was no reflection of the splendour he had left, and which he still seemed to see. To a man with his conscientiousness the endeavour to realise his ideal became as exhausting and as vain as a search for the philosopher's stone, or the power of perpetual motion. It was worse for mind and body than painting pictures to be sold in the street to gain a little bread. Claude was thus in the same condition as the English Haydon, who, in the midst of physical misery, had to learn that his hand was incompetent to draw the heroic figures which he could describe in words. Barry, in his green baize coat, all smudged with paint, was for a time in a like state, and was supposed by comfortable citizens to be simply deranged, when he was crying out about the Divine head which haunted him, and which he was unworthy to paint. The placid Müller saw the ideal after he had engraved the faultless *Sistine Madonna*, and as the opportunity to realise it was lost, believed he had no more business in life and was bound to seek out death. Claude also heard the voice which, as Shakespeare says, cries, "Come ! to him that instantly must die," and he obeyed it. His easel became his gibbet.

In the old days it was supposed that life was a post which a man was bound to guard, and the instinct of humanity rebelled against suicide. Our time has become

less healthy, and M. Zola, speaking in the person of his prototype Sandoz, seems almost to become an apologist for so short a way of getting rid of a difficulty. Claude, says the novelist, was logical and brave, and announced his impuissance. "Yes," replies Bongrand, "and if we did not care so much for our skins we should all emulate him." And the novelist concludes by saying that since we are no longer able to create we may as well break our heads at once.

It is an odd sort of message to offer for the consolation of the world. Paint or write with all your soul and you go mad after a life of agony, or if you have a strong frame you may flee to the country and fatten geese, like Courajod, to while away time. Adopt a standard which might have been set up by the Father of Lies, and you may look forward to a seat in the Institute and a whole house near the Parc Monceau. It will go hard with the pessimists who contemplate the world from a café on a boulevard of Paris to discover anything more dreary in this life. But there is another interpretation. May we not suppose that M. Zola is becoming wearied of the restrictions he places on his own powers in his attempt to be realistic, that he knows how painters and sculptors of the school are also wearied, and that his tragedy is a lament over the failures of aspirations?

THE VENICE EXHIBITION.

THE preliminary difficulties connected with the arrangements for a National Exhibition of Fine Arts to be held in Venice next year have now been disposed of, and a working committee appointed. This committee, says the *Venice News*, is now engaged in settling the various details of the scheme, and the plans for the temporary building are already in progress. This structure will be erected in the Public Gardens, but the design of the elevations is not yet decided upon. We believe that having regard to the strictly temporary character of the building no distinctively architectural character will be given to it, but a system of decoration adopted which will accord not ill with the surroundings while avoiding any extravagant pretensions. Being a strictly national exhibition, the works of foreign artists will not be admitted except on certain conditions of residence in Italy, the particulars of which have not yet been definitely settled.

THE PROPOSED MANCHESTER EXHIBITION.

THE committee appointed at the recent public meeting met on Tuesday at the Manchester Town Hall. The Mayor presided. The report of a sub-committee was presented by Sir J. C. Lee with regard to the expenditure that would probably be necessary for the exhibition, and also as to the probable receipts. It was estimated that the expenditure would not be more than 100,000*l.*, and that the receipts would at least reach a like sum. The meeting decided that the next step to be taken was to ascertain at once if a guarantee fund of perhaps 100,000*l.* could be raised, and if a sufficient number of influential gentlemen were willing to act as members of a managing committee. The further consideration of Sir J. C. Lee's report was postponed, and a sub-committee was appointed to obtain the information above indicated.

The general object of the exhibition will be, according to the *Manchester Guardian*, in the first place to celebrate the jubilee of Her Majesty's reign. It would be in no sense international, but rather local, the area to be covered being comprised within a radius of fifty miles round Manchester. There would be brought together a collection of objects illustrating the history of art productions during the last fifty years, especially those of the manufacturing districts which this area represents. The history would also be illustrative of mechanical appliances within a like period and within the same area. The difficulty in the way is first as to money and men, and secondly as to time. The committee, as above stated, have not yet been able to present a final report; it is, however, understood that a number of gentlemen of high position and special artistic or manufacturing knowledge have undertaken to act as an executive provided others can be found who are willing to work with them. As to time, it has been shown that both the Edinburgh and Liverpool Exhibitions, and also the Art Treasures Exhibition of 1857, were erected within the length of time now possible in the case of the proposed exhibition. A site at Old Trafford not far distant from that of the famous Art Treasures Exhibition has been pointed out as best adapted for the purpose in view. The advantage of such a site is obvious. The Botanical Gardens are in the immediate vicinity, and there, it may be anticipated, music and relaxation of the most agreeable kind would be found. In deciding as to the character of the proposed exhibition the promoters have in view something more than the mere gratifying of public curiosity; the aim will be to give the exhibition a truly educational character, and at the present time, when so much attention is being directed to technical instruction, it would in that respect be a most desirable undertaking.

An effort is being made to obtain the names of thirty gentlemen who would be willing to act as guarantors, and not only so, but to devote the time and attention requisite to work out the scheme and place its success beyond doubt. We are assured that, so far as the money is concerned, no difficulty is anticipated; the chief difficulty will be to secure men who have the time at their disposal, and will carry the thing forward energetically.

THE EGYPT EXPLORATION FUND.

A SPECIAL general meeting of the supporters of the Egypt Exploration Fund was held on Tuesday in the theatre of the Royal Institution, Albemarle Street. Among those present were Sir William Gregory, Mr. A. S. Murray, Keeper of the Greek and Roman Antiquities in the British Museum, Dr. Hyde Clarke, Mr. Robert Cust, Judge Bayliss, the honorary secretaries to the fund (Mr. Reginald Stuart Poole, Keeper of the Coins in the British Museum, and Miss Amelia B. Edwards), Mr. Talfourd Ely, M.A., Mr. Benjamin Vincent, and Mr. E. M. Thompson, Keeper of the Manuscripts in the British Museum. Mr. C. T. Newton, C.B., occupied the chair.

Mr. Ernest Gardner read an interesting report of the season's work at Naukratis, the earliest Greek city in Egypt, and he also laid on the table the first part of the Society's forthcoming publication on the excavations and researches now in progress at Naukratis. After a brief notice of Mr. Petrie's unearthing of the city, and of the training of overseers and labourers to work with good order and discipline, he pointed out that of five great temples mentioned by the Greek literary authorities, four had now been discovered, two this season and two in Mr. Petrie's previous explorations. This year the cemetery had also been found, but the part that could be excavated contained only the graves of a later period, whereas the best time of Naukratis was the sixth century B.C. These graves contained coffins of tile and of wood, the latter decorated with terra-cotta ornaments, gorgoneia, &c., many of which had been found. The burials were always after the Greek customs, no traces of embalming being found. Articles of use and ornament were also buried with the dead. In the *temenos* or shrine of the Dioscuri the plan of a temple built of unbaked mud brick faced with plaster had been recovered. In front of it were pillars of the same materials. The temple of Aphrodite consisted only of mud-brick walls, enclosing one, or in the earlier temple two chambers. In front of it was a great altar, built of ashes, held together with a mud-brick casing. The yard of the temple was covered with a layer of fragments which had yielded a great number of vases and statuettes more or less perfect. These were all of early period, and many were inscribed in the characters of the sixth century B.C. The *temenos* of the Samian Hera had also been found, but had not been rich in results. Some smaller articles had been found in the town, including a beautiful portrait-head of the period of Berenike II. in blue porcelain. It did not seem advisable to continue the work at once, as no result might ensue, but rather to watch the site till fresh remains were uncovered by the Arabs. Up to the present moment much had been gained. A most valuable series of inscriptions served not only to throw light on the early history of the Greek alphabet, but also to decide the age of many classes of vases and sculptures whose date had previously been a matter of conjecture. By ascertaining the real nature and importance of the colony of Naukratis its position in history was established; it was merely a trading emporium, but owing to the surroundings that prevented its growing in size or prosperity, its art and handicrafts were stimulated by emulation. Its influence on Greece in the sixth century must have been of great importance.

Sir William Gregory, who moved a vote of thanks to Mr. Gardner, thought with the chairman that holding a special meeting to hear an account of their operations at Naukratis was a perfectly wise arrangement. They had that afternoon listened to a most interesting account of the Society's operations in Egypt, and he hoped they would be encouraged thereby to continue their explorations of so enterprising a site.

Mr. R. N. Cust seconded the motion, which was agreed to.

Miss Amelia B. Edwards announced that the special fund already amounted to 700*l.*, and hoped that at their next meeting the proposed 1,000*l.* would be made up.

The proceedings terminated with a cordial vote of thanks to the chairman.

MANCHESTER ARCHITECTURAL ASSOCIATION.

IN the competition for prizes for the best sketches offered by the president, Mr. L. Booth, F.R.I.B.A. (a report of which was published in our last week's issue), the referee, Mr. A. Darbyshire, F.R.I.B.A., has awarded the first prize of two guineas for a water-colour sketch by Mr. F. B. Smith; and the second prize of one guinea to Mr. F. Ward, for his pencil sketch. Mr. Darbyshire in his report speaks very highly of the two successful drawings, and favourably mentions the work of several other competitors. There were six water-colour and seven pencil sketches submitted for competition.

TESSERÆ.

Modern Italian Architecture

W. H. Leeds.

THOUGH we have had many modern architectural works relative to the principal cities of Italy, they have all of them been exclusively retrospective or nearly so, exhibiting only the monuments of former periods of the art, and showing scarcely a single recent example. Admitting that the subjects selected for them are of more intrinsic value as studies than any buildings of recent date, still some of the latter would at least possess the interest of novelty. Architecture is not absolutely defunct in Italy, although it might almost be imagined that it had not produced a single work of any note since the commencement of the present century, so little is the information to be met with relative to any edifices that have been erected there within the last forty or fifty years. It would seem to be an express rule adhered to by all our tourists, architects, and artists who visit that country, not to take any notice of contemporary buildings, on no account to describe or to delineate them, but to bore us for the ten-thousandth time with their ecstasies with the Pantheon and St. Peter's, with Palladio and Michel Angelo. If they can bring home nothing less stale, they would do well neither to take up their pens nor open their mouths. Of Cagnola they of course have never heard, Possagno they have never visited, nor have they ever stumbled upon the Café Pedrocchi at Padua—a palazzo in appearance, and a sufficiently striking specimen of the modern Greco-Italian school—with much elegance to recommend it, though not free from defects. Although it may not be ranked among the public edifices of that city, it is, as a piece of architecture, quite as conspicuous an object as the Reform Club House, which last, perhaps, a tourist through Pall Mall would not have eyes to discover. A work containing examples of the Italian architecture of the present century would be a welcome novelty, and though the buildings themselves may be comparatively few and far between, still ample materials for the purpose are to be collected between Milan and Naples, from the structures by Bianchi and Niccolini, in the last-mentioned city, to Buonsignore's church, the Madre di Iddio, at Turin, and Canova's Doric rifacciamento of the Pantheon at Possagno.

The Dome of St. Paul's.

G. Wightwick.

Thoughtless cavils have been raised on the subject of the double dome (we might as well say the triple dome) of St. Paul's. The dome of the Pantheon at Rome, having nothing but itself to support, is a simple vault of masonry, so low in proportion and so immensely buttressed as to be prepared for an earthquake. The dome of the Florentine cathedral is so highly pointed as to approximate towards the cone, and it is therefore the more fitted to bear the stone lantern at the top. The dome of the baptistery at Pisa is formed of a lofty internal cone, supporting the outer vault or hemispherical covering. The non-appliance of constructive knowledge in the dome of St. Peter's at Rome was felt before it was finished. The lantern was made less than originally intended, but still it proved too heavy for the great vault that could hardly find safety for itself alone, and it has only been preserved to our wonder by hoops of iron—the means taken by Wren to secure the safety of Salisbury spire. Our scientific architect had marked the failure of the Gothic architects in their deficient regard for lateral thrust. He had observed how fearful might be vertical pressure on a domical vault. Whether he was acquainted with the Florentine and Pisan examples we know not; but if not, he had intuitively the knowledge they would have afforded him. He had to place upon the top of his dome a stone lantern, with its ball and cross measuring some 90 feet in height. He therefore adopted the principle of the Pisan Baptistery. He constructed his inner brick cupola of the form and altitude he considered best for internal effect, Over this he built a cone, just free from pressing on his cupola, and he carried it upward till it met the required width for the base of his lantern, finishing his cone with a domed top as at Pisa. This being determined, the attic storey of his tambour arose to press down upon the common springing of cupola and cone, and not to remedy a defect, but "to make assurance doubly sure," he applied his hooping chains of iron. To protect the cone a roof was necessary, as that which covers the vaulting of his nave and aisles, and of the same material, *i.e.* wood and lead, the purpose of protection and endurance being precisely the same in both cases. Apart from what Roman design requires—apart from the majesty of the hemispherical form—is there a man breathing who would cover a circular cell and its cupola vault with anything but a hemispherical roof, as the best for affording the perpendicular weight of leaded timber upon the buttress of the cone, with means for effectively confining from bulging, either in or out, the masonry of that cone? The high Gothic dome of Florence is not admissible in pure Roman design, but a lantern, ponderous as that of Florence, is required. The simple hemispherical dome will not safely support such a lantern. The Pisan mode of construction suggests the mode of security.

Slating in Paris.

G. R. Burnell.

The slates used in Paris are extracted at Angers, in the department of the Marne and Loire. The quarries furnish a slate of a very fine grain, remarkably thin and light, although the specific gravity of the slate is very great. It is 3·000, water being 1·000, or 188 lbs. per foot cube. Four sizes are worked for the Paris market, viz. the *grande carré forte*, $11\frac{5}{6}$ long by $8\frac{1}{4}$ wide and $\frac{1}{6}$ thick ($0^m.298 \times 0^m.217 \times 0^m.003$); 2nd, the *grande carre fine*, of the same dimensions as to length and breadth, but of about half the thickness; 3rd, the *cartelettes*, $8\frac{1}{4}$ long by $6\frac{3}{8}$ wide by $\frac{1}{8}$ thick ($0^m.217 \times 0^m.162 \times 0^m.003$); and 4th, the *cartelette fine*, of about half the thickness. The usual practice in Paris and in the departments of the Lower Seine is to nail the slates with two nails upon battens half an inch thick and from $4\frac{1}{2}$ inches to 7 inches wide, that is to say, either of deals cut in two or of battens. Sometimes these *voliges*, as they are called, are of poplar or sycamore, but they decay very rapidly. The slates lap over one another two-thirds of their length, leaving a *pureau* of one-third, when the inclination of the roof is not above 33°; at 45° the *pureau* is one-half of the slate; at 60° two-thirds. The battens are rarely laid close, for the slates are found to decay more rapidly if there be no circulation of air. The usual space between the battens is about $1\frac{1}{2}$ inch. Hips, ridges, valleys, and gutters are executed as in England, with the trifling exception that step-metal flashings are unknown; the slates are made good to the Pignon walls by merely covering the meeting angle with plaster.

Villard de Honnecourt.

H. B. Garling.

He appears to have been born at Honnecourt on the Scheldt near Cambray, and he writes in the Picard *patois*. There is great reason for believing that he was the architect of the choir of Cambray Cathedral, now unfortunately destroyed. He tells us that he travelled much; he visited Laon, Chartres, Lausanne, and Rheims, the latter place undoubtedly during the progress of the works at the cathedral. We get, therefore, an approximate date, somewhere between 1230 and 1250. He was then sent for into Hungary, where he stopped many days. Now we find that in 1242, Strigonia, then the capital of Hungary, was destroyed in an irruption of the Tartars, and that on their being driven back the next year, Bela, the King of Hungary, commenced rebuilding the city and the cathedral dedicated to the Virgin; and we may presume that Villard de Honnecourt, then a man of great reputation, was sent for to design and execute these works. It is alleged by the editor, M. Lassus, that there are various churches in that neighbourhood which exhibit evidences of French influence. All these dates and circumstances compared, give us some data for fixing the identity of the artist. We find him a man of restless activity of mind, of singular versatility of talent, and of powers of observation at once subtle and comprehensive; eager to gain information from every source, ready in applying it to every purpose. He appears to have resembled (taking the standard of his age) the ideal character sketched by Vitruvius—the man of universal accomplishment, the *facile princeps* in every art—trying his hand at everything, and proving himself master of all. Thoroughly versed in all the practical science of his day, we should suppose that this alone was his forte, from the attention he enjoins to its precepts, did we not find that it simply assists him to the more perfect mastery of higher accomplishments. In mechanics he gives us now a mechanical toy, and now a military engine, machines for cutting timber, hoisting, screwing up, and executing the rougher preliminary operations of building. In architecture, he studies only from the most beautiful subjects and the best models, and educates his powers of hand and eye to the highest vocation of the artist. He gives us sketches of natural objects to be applied to their most appropriate places in design, drawings of mouldings and details, all of exceeding beauty. To geometry he pays the reverence so characteristic of his age, and would fain make us believe that his skill in freehand drawing is simply a more

refined application of its principles. As an artist, he adds the finest feeling in design, in some instances, to the most enviable skill in draughtsmanship; the conception just, appropriate, and spirituelle, expressed by the outline, firm, vigorous, and free.

Conveyance of Sound.

M. C. Meigs.

Experience shows that the human voice, under favourable circumstances, is capable of filling a larger space than was ever probably enclosed within the walls of a single room. Herschel, in his admirable treatise on sound, gives a few instances which are instructive. Lieutenant Foster, on Parry's third Arctic expedition, found that he could converse with a man across the harbour of Port Bowen, a distance of 6,696 feet, or about 1¼ mile. Dr. Young records that at Gibraltar the human voice has been heard at a distance of 10 miles. I have myself, on the shore of Lake Champlain, at evening, heard the echo of the voice returned from the opposite shore, at a distance of nearly two miles, the sound having travelled between three and four miles before it returned to the ear. If sound be prevented from spreading and losing itself in the air, either by a pipe or an extensive flat surface, as a wall or still water, it may be conveyed to a great distance. Biot heard a flute clearly through a tube of cast-iron (the water-pipes of Paris) 3,120 feet long. The lowest whisper was distinctly heard. In fact, the only way not to be heard was not to speak at all. Standing on the platform used by the painters in the new Congressional Library, Professor Henry and myself conversed in a low tone, hearing distinctly from one end of the room to the other. The room is 99 feet long. The platform is about 7½ feet below the deeply-moulded iron ceiling. Professor Reid states, in describing his lecture and practical classrooms, which together occupied a space of about 80 feet square, that in every part, both of the lecture-room and of the practical classroom, whether crowded or empty, the slightest whisper or the loudest noise was heard distinctly, without offensive reverberation or the necessity of any exertion of the voice beyond that used in conversation. The favourable circumstances seem to be a perfectly tranquil and uniformly dense atmosphere, absence of all extraneous sounds, absence of echoes and reverberation, vicinity of reflecting surfaces, and perhaps in some measure the presence of substances which conduct sound well. A pure atmosphere, being favourable to the speaker's health and strength, will give him greater power of voice and more endurance, thus indirectly improving the hearing by strengthening the source of sound, and also by enabling the hearer to give his attention for a longer period unfatigued.

Marine Worms and Timber.

T. Stevenson.

In landlocked bays, where a deep-water landing-place is all that is required, and where the bottom is sandy or soft, timber may be employed with great advantage. Even in exposed situations timber can also be used, but the fatal disadvantage attending its employment in most places where there is no admixture of fresh water is the rapid destruction occasioned by marine worms. The damage occasioned to harbours in this way is noticed by Semple in his treatise "On Building in Water" in 1776, and very probably by much earlier writers. Indeed, the ravages of the *Teredo navalis* are very ludicrously described by Hector Boece, in his "Croniklis of Scotland," printed at Edinburgh, *circa* 1536. In the Atlantic Ocean the *Teredo navalis*, and at many places in the German Ocean the *Limnoria terebrans*, are the animals which are found to destroy any structure of timber which is exposed to the water. They are found to eat most rapidly between the bottom and low-water mark, but above low water the damage is not so great, and what is singular, they do not appear to exist at all below the bottom where the pile is covered with sand. These observations do not, however, quadrate with Mr. Hartley's at Liverpool, for he found the parts which were alternately wet and dry to decay faster than the parts which were constantly immersed. Even solid limestone is often destroyed by the persevering efforts of another marine animal called the *Pholas*. The late Mr. R. Stevenson made several experiments on the ravages of the *Limnoria terebrans* at the Bell Rock in 1814, 1821, 1837, and 1843, by fixing pieces of different kinds of timber to the rock, and getting regular reports on their decay. From those experiments it appeared that green heart, beef wood, and bullet tree were not attacked by the worms, while teak stood remarkably well, although suffering at last. The kyanising fluid and other preparations have been tried, but were not found to be of permanent service. In addition to these experiments on timber, no fewer than twenty-five different kinds and combinations of iron were tried, including specimens of galvanised iron. Although separate specimens of each were tried in places where they were always under water, and also in places where alternately wet and dry, yet all the ungalvanised specimens were found to oxidise with much the same readiness. The galvanised specimens resisted oxidation for three or four years, after which the chemical action went on as quickly as in the others. Green-heart timber is now generally had recourse to in places where the worms are destructive. It appears to have been first used by Mr. J. Hartley, of Liverpool, who published in the "Minutes of Institution of Civil Engineers" an account of its virtues in 1840, as ascertained at the Liverpool Docks. Its cost is considerably greater than memel or than most of the other timbers generally used. Memel logs for the inner piles of piers might, perhaps, from their not being exposed to abrasion from ships, be clad with green-heart planking at those parts which are exposed to the worm. Copper sheathing and scupper nailing are often and successfully employed as protections for piles in exposed situations. Breaming or scorching the wood, and afterwards saturating it with train oil, also forms a partial protection. It is much to be regretted that green-heart timber is so expensive in this country, and that some simple and economical specific against the worm has not been discovered for protecting memel and the cheaper kinds of pine.

Foundations.

Sir R. Rawlinson.

The modern architect has at his command means and appliances of the greatest utility, which were unknown to men in former times. Steam can be brought to aid in driving timber piles, and simple applications of water or air will sink hollow iron piles with comparative ease. The old Eastern plan of forming deep wells and then filling them up with concrete has been too much neglected. Modern well-sinkers will go down in any strata almost to any depth—certainly to any depth required in practice; and a secure foundation may thus be made for the loftiest structure in the most difficult ground. Masses of concrete or of brick or stone work placed on a compressible substratum, however cramped and bound, may prove unsafe. Solidity from a considerable depth can alone be relied on. Enlarging the area of a base or foundation by footings can be resorted to; but mere enlargement of area may not in itself be sufficient. A lofty structure which is to stand secure must have solidity sufficient to maintain each part in the position in which it is first placed. Foundations are too frequently slighted, or labour and material are wrongly applied. The compressibility of oolitic and tertiary clays can only be overcome by piling, deep sinking, heavy ramming, or heavy weighting. The point of bearing must be carried below any possibility of upward reaction. A heavy embankment or heavy pile of building frequently disturbs the surface ground at a distance of many yards, the subsidence causing a corresponding rise around or on either side, as the case may be. A tall chimney, or tower of like proportions, built on such a foundation, if not made safe to a sufficient depth, would most likely become a "leaning tower," if not actually a falling tower. Probably the depth of a foundation in compressible ground ought not to be less than one-fourth the intended height above ground; that is, for a shaft of 200 feet the foundation should be made secure to a depth of 50 feet. This could easily be done by piling, or by well-sinking and concrete.

Cold Hammering of Iron.

J. Nasmyth.

It either is or ought to be known to all practical men concerned in the working of wrought iron that if a piece of the very best and toughest iron is hammered in the process of forging until it ceases to be red hot, that the effect of such cold hammering, as I may term it, is to cause the iron to become so brittle that it will in many cases break across in the process; or if it does not at that time, this process of cold hammering has so removed and destroyed its tenacity as to render it capable of being broken with the slightest blow. What renders the knowledge of the effects of such a process the more important is that in most cases we shall find that, in order to give the pieces of forged work the requisite finish and fine surface as they come from the hands of our workmen in that department, that this very cold hammering and swaging, as it is termed, is required, the more so as it is by such a process that iron forgings are so finished from the hammer so as to require the least possible labour after; and as every good workman in that department is anxious to turn his work out of hand with the very best surface on it, which this cold hammering enables him to do, it is not a very easy matter, and not at all desirable, to require them to discontinue the practice, which many have endeavoured to do from want of a full knowledge of the subject. There is nothing inherently wrong in this practice of cold hammering—far otherwise; the evil rests with the applying such a cold hammered piece of forge work to its purpose without having been passed through the curative process, which is simply this, namely, to heat the piece of forged work in question to a dull red heat, and lay it down to cool at its leisure. By subjecting wrought iron to the most violent hammering or compression at a low temperature, and then submitting the ironwork so treated to the simple process of heating red hot and slow cooling, we enhance its tenacity or shock-sustaining qualities at least twenty times.

A JANISSARY.

ONE of the many creditable qualities of *L'Art* is its international character. The magazine seems to recognise all forms of art and artists of all countries. There is only one condition—the works must be of the highest class. Last week we gave an etching after ROMNEY, and it must be said that hitherto no illustration of the English painter's work produced in London comes near the etching which was published in *L'Art*. This week we give another etching from a drawing by Senor FABRES, a Spanish artist, which might have come from DELACROIX or DECAMPS. Very few people could have heard of the artist before they saw the effective etching by M. RAMUS. This generous recognition of foreign art is, however, no more than was to be expected from a periodical which holds the foremost place among works of its class.

INGESTRE HALL, STAFFORDSHIRE.

INGESTRE HALL, which was destroyed by fire over three years ago, and of which we give two views as restored, is situated about five miles from Stafford, in the centre of an extensive and beautiful park. The original mansion was built about the year 1600, and laid down on the lines of an earlier period of architecture, as indicated by the disposition of the plan, much of the subsequent detail pointing to a later date. As in so many mansions of the same period, a great deal of the comfort and convenience was here sacrificed to exterior effect. The old house, as it originally stood, must have been very fine, but subsequent additions and alterations executed in the debased Tudor style of some sixty years ago have done much to impair the native beauty of the building, and there now remains but a very small portion of the original design to show clearly what the whole was. A part of the south front, which is the principal one, escaped the effects of the late fire, but even this was spoiled by the demolition of the original gables and the substitution of others in the above-named style, and at the time mentioned, ill-proportioned and ugly. Happily the ravages of the fire, which gutted the place, brought them to the ground, and the architect of the restoration has endeavoured to put them back to what was considered to be the forms of the original idea. It is only to be regretted that the partial destruction to the north and west fronts, which were built about sixty years ago, did not admit of their being pulled down and treated more in harmony with the original design. The upper portion of the central feature of the south façade, which had formerly a flat roof, has been executed in more strict keeping with the general design than heretofore.

The interior has been entirely rearranged on the most modern principles, and a vast improvement effected in this direction. The arrangements for the prevention of fire are also complete, fireproof floors being constructed throughout, and the supply of water in any such contingency being abundant. The building is encircled by a main tapped at intervals, from which two branches are carried up at each end of the house inside, and provided with hose apparatus on each floor. The plan is so arranged that some of the principal partition walls are carried up from foundation to roof, thus dividing the building into sections and limiting the range of fire should such break out. The entrance hall, of which we give a view, is 66 feet long by about 30 feet wide, and opposite the entrance door is the grand staircase. At one end of the hall is a music gallery for use on festive occasions. The walls are panelled to about 9 feet all round, and surmounted by a carved frieze and cornice, all executed in wainscot. A good deal of elaborate work has otherwise been introduced. The grand staircase is similarly panelled. The ornamental ceilings have been executed in fibrous plaster, and the floors of polished oak. Mr. JOHN BIRCH, of No. 8 John Street, Adelphi, London, is the architect.

THE BIRMINGHAM ART GALLERY.

THE report of the Museum and School of Art Committee of the Birmingham Town Council, states that the question of opening the Museum and Art Gallery on additional evenings in the week has been carefully considered. The building is already opened on Monday and Saturday evenings, and the committee have prepared estimates of the cost of opening on Tuesday, Wednesday, Thursday, and Friday in addition; and also of opening it on two additional evenings only. The extra cost of opening on two additional evenings per week is estimated at staff, 210*l.*; gas, 145*l.*; total, 355*l.* per annum, or say 3*s.* 8*s.* per evening. The additional cost of opening four extra nights (that is six nights) per week until 10 P.M. is estimated at 725*l.* In addition to these expenses, the committee consider that in case of opening each night during the week the engagement of an assistant-keeper would probably be necessary, at a cost say of 150*l.* per annum, bringing up the total extra cost of opening the Museum and Art Gallery for six nights per week to 875*l.* per annum. The committee report with reference to the evening attendance, that the average number of visitors on Monday and Saturday evenings, from January 4 to May 24, was 1,200; the highest number being 2,812, and the lowest 306 (on a very wet evening). Eight evenings in May give an average of 906 visitors, but the attendance during the autumn and winter months will, of course, always be greater—the attendance during eight evenings in February averaging 1,600. The question of opening every evening may very seriously affect the acquisition of valuable loans, owing to the prolonged nightly exposure of pictures to heat and dust, and to the additional hours during which artificial light must be used for cleaning purposes throughout the winter months. In all picture galleries of importance it is found absolutely necessary that the collections should not be continuously exposed to the dust and heat inseparable from the continuous presence of large crowds in the galleries, and when, in addition to daily exhibitions the rooms are open each night, it is found that the unduly high temperature there maintained has an injurious influence upon all works not placed under glass, and that even those which are protected by glass cannot be adequately defended from the effects of a heated and overcharged atmosphere. In view of the large additional cost entailed and the undoubted liability of the contents of the gallery to damage from the causes above stated, the committee think it would be undesirable to open the museum and art gallery for more than two additional evenings per week, and they therefore recommend that they be authorised to open it for such additional period, at an estimated extra expenditure of 355*l.* per annum, this additional opening in their judgment being adequate to the public requirements.

THE REMAINS AT TIRYNS.

A SPECIAL meeting of the Hellenic Society was held on Friday last in the rooms of the Society of Antiquaries, for the purpose of discussing the questions at issue between Dr. Schliemann and the *Times* correspondent at Athens, respecting the remains discovered by the former at Tiryns and Mycenæ. Dr. Schliemann had come expressly from Athens to read a paper in support of his views, and Dr. Dörpfeld, his collaborator, also read a paper. The chair was taken by Dr. Evans, F.R.S., president of the Society of Antiquaries, and there was a large attendance of ladies and gentlemen.

The first paper was read by Mr. F. C. Penrose, in the course of which he said:—My visit to Tiryns and Mycenæ last April was a very hurried one, undertaken solely in the desire to understand better Dr. Schliemann's descriptions. My companion, however, whose letters in the *Times* are doubtless familiar to you, had been over the ground before, and was also familiar, by the study of many years, with Pelasgic work in Greece and Italy. We were led by what we saw both at Mycenæ and Tiryns to doubt the extreme antiquity assigned by Dr. Schliemann to the remains he has excavated, and I gave my companion leave if he thought fit to state that I agreed with him in this respect. The only question which I wish to raise is this—Do the walls which have been uncovered by Dr. Schliemann belong to the same epoch of civilisation as the so-called Treasury of Atreus and the Gate of the Lions at Mycenæ? But while raising this question, far be it from me to undervalue the munificence, the zeal, and self-devotion of Dr. Schliemann, and the very remarkable discoveries which he has made; but when I think of the character of the work I saw at Tiryns and Mycenæ, notwithstanding all I have read or heard since on the subject, I think that there must be a further sifting of the evidence before these structures can be assigned unquestionably to the Pelasgic epoch. The position I take up is this, that there is such a fundamental difference in character of work between the un-

doubted Pelasgic architecture of Mycenæ—that is, the Treasury and the Lion Gate, &c., and the so-called palace of Tiryns, that they have nothing whatever in common. The meanly built walls of the latter, generally of quite small stones, easy for one man to lift but with somewhat larger stones inserted here and there, which have been worked with the saw and chisel, and also with a tubular metal drill, and with not unfrequently bricks introduced—fairly burnt red bricks—all these circumstances seem to be quite inconsistent with the Pelasgic period, and they appeared to pervade the larger portions of the walls. Dr. Schliemann seems to attribute the presence of burnt bricks to the action of the conflagrations which have destroyed the palace. In the opinion of an experienced brickmaker whom I have consulted, no regular bricks could be converted from sun-dried bricks built up in a wall by such a cause, although they might be partially vitrified in an irregular manner and would probably be cracked. The bricks I am referring to had all the appearance of kiln-burnt bricks, whereas the stones of the undoubted Pelasgic walls are large, dressed without metal tools. The saw cuts, too, which are seen all over the newly-discovered remains, are not found in the standard Pelasgic works. Certainly at Mycenæ, and I think at Tiryns, there are mixed up with the walls claimed as pre-Homeric, stones taken from older structures as borrowed materials—and these appeared to me as of regular Hellenic workmanship of classical times. The analogy of certain very rude and mean walls recently unearthed on the Acropolis of Athens has been thought to confirm the date of the palace of Tiryns; but the walls of Athens, though they seem to be older than the Persian invasion, carry us only a very small way backwards towards the age of the Atridæ. These remarks apply quite as much, or more, to the house and tombs at Mycenæ. I believe the treasures and pottery found at Tiryns, as well as at Mycenæ, have their own difficulties before they can be recognised as pre-Homeric, but they cannot of themselves prove the great antiquity of the structure in which they were found. Only on three points will I venture a remark. There is some similarity between the buttons, or *bullæ*, found in these tombs with others found at Olympia, which, of course, cannot be pre-Homeric. Again, the swords, especially those of the leaf pattern, have great resemblance to swords with which we are familiar in the north, of Celtic or Teutonic make. And I lately saw in the museum at the Pump Room at Bath a mask, of which I produce a photograph (obtained for me by the kindness of Mr. Elton), which has a remarkable family likeness, although of meaner material, with the golden masks of the Mycenæ tombs. This mask, made of lead or a kind of pewter, was found among the Roman baths, and was probably used in the sepulture of some Celtic ally of the Romans, in the first or second or third century of our era. As respects the decorations—I speak from the drawings, for I did not see the originals—although there may be some archaic character about them, they are so rude and inartistic that they might be bad imitations of earlier work. The pottery fragments seem to be of a very mixed character. That there are some archaic specimens on so ancient a site is not surprising, but these fragments are, to say the least, inconclusive, except so far as to show that the site has been occupied and reoccupied, and that the walls we now see may be entirely or chiefly of the latter construction. However, as I said at the beginning of this paper, I make these statements in the hope that these newly-discovered works may be examined by those who have opportunity, research, and leisure to go carefully into all doubtful points, and if the final report should be in favour of their great antiquity, I doubt if any one, except, of course, Dr. Schliemann and Dr. Dörpfeld, will be more gratified than I shall be.

Dr. Schliemann then read his paper as follows:—In July 1876 I solicited and obtained from the Greek Government the permission to excavate at Mycenæ, because by a certain passage in Pausanias, which I considered to have always been misunderstood, I hoped to discover the tombs which had been shown to that traveller as the tombs of Agamemnon and his companions. On the way to Mycenæ I had to pass Tiryns, and I could not resist the desire to stop there for a week in order to sound the ground both inside and outside of that ancient stronghold. I found the surface of the upper plateau to be very uneven, owing to a number of house walls, apparently composed of lime and bricks, which were peeping out from the surface, and which formed such hard and compact masses that I could not cut them with the ordinary pickaxe. They must, therefore, at all times have prevented the cultivation of the field. I firmly held these walls to be of a late Byzantine time, and to belong to a villa of the eleventh or twelfth century of our era. I was strengthened in this belief by a floor of lime-concrete and pebbles which I found at a depth of from three to five feet between the walls, as well as by a few Byzantine potsherds which I picked up on the surface of the ground, and by distinctive Byzantine pottery which I found down to a depth of three feet in a ditch at the southern extremity of the upper plateau. I trust, gentlemen, that you will generously pardon me, as a layman in architecture, this error, considering that all travellers, and even the greatest luminaries in architecture who visited Tiryns, must necessarily have fallen into the same mistake, for you contend with me that, if such had not been the case, the prehistoric palace at Tiryns would have been excavated many years ago, and that honour could not have been reserved to my collaborator, Dr. Dörpfeld. The architecture of the ancient Greek houses has hitherto been a mystery to us; we could not boast of knowing the plan of a single dwelling-house of the Classical time of Greece. It is, therefore, but natural that great importance should be attached to our discovery of a vast palace of the remote heroic age, and we are not at all surprised that our discovery should be received with incredulity. We are not at all surprised that men eminent in science and art should come out to Tiryns to verify the veracity of our discovery. But it is of paramount necessity that they should read our book "Tiryns" before setting out on their journey, and that they should take it with them for reference and for testing the accuracy of our plans, which my dear, much-lamented friend James Fergusson used to call masterpieces of architectural skill. Unfortunately this first and capital condition has not been fulfilled by your travellers. They had probably not read the book at all; at all events they left it at home, and they were consequently obliged to reconstruct the plans, which is a very hard, not to say an impossible work, for earth and sand have been heaped up in the palace by order of the Greek Archæological Society in order to preserve the painted floors and the thresholds from injury, and nothing can now be seen of these and other important items, whereas, with the plan in hand, the visitors could easily bring them to light by digging a little with the foot. Besides, your travellers without plans had necessarily to jump into the same atrocious errors into which all travellers fell before our excavations, namely, the error to mistake the prehistoric walls of the palace for late Byzantine walls of lime and bricks, whereas in reality they consist of quarry stones loaded with clay mortar. But in the great conflagration which destroyed the palace the stones were calcined wherever beams of timber fed the flames, and thus the traveller thinks now he sees lime everywhere and particularly so in the glare of the Oriental sun. How easy it is to mistake a wall for what it is not and to make mistakes of more than 2,000 years in the age of a wall! That, I think, could not be better illustrated than by the great circular enclosure wall at the royal tombs at Mycenæ, which was brought to light in a very ruined state in my excavations in 1876. But, wishing to consolidate the terrace of the tombs, the Greek Archæological Society has reconstructed this enclosure wall in 1876; it has also restored approximately in the shape in which I had found them the internal walls of the tombs of which I have been obliged to take out every stone in order to save the gold. Now the *Times* correspondent, Mr. Stillman, an eminent Oxford professor, and two distinguished members of the American school at Athens, discover in these walls some sculptured blocks of the Classical time; they consequently proclaim that these walls are of the third century B.C., and conclude therefrom that the royal tombs of Mycenæ belong to and have been built by those Celtic barbarians who invaded Greece in the time of Pyrrhus (about 285 B.C.). They are strengthened in this belief by two shabby-looking, somewhat irregular buildings to the right and left of the tomb terrace, which they likewise attribute to those barbarian Celts. But it is an historical fact that the Celtic barbarians only came as far as Dephi and never reached the Peloponnesus; it is further an historical fact that those walls are hardly ten years old; it is further a fact, of which everybody can easily convince himself, that the so-called barbarian Celtic buildings to the right and left are merely the foundations of two prehistoric buildings, that these foundations were destined to remain always underground, and that they always have been underground, for the antæ on the top of them can leave no doubt in this respect. Gentlemen, it is an established fact, it is a stubborn fact, in archæology that an ancient ruin may be older, but that it cannot possibly be later than the latest objects of human industry which we find within it. Now let us see what we find in the prehistoric palace of Tiryns. We find the walls both in the outside and on the inside wainscotted first with a layer of clay and then with a still thicker layer of lime, which is smoothed and polished and covered with paintings of the most archaic patterns that have ever been found. We find among them the pattern of the marvellous thalamos ceiling of Orchomenos. Similar wainscotted and painted walls I found at Mycenæ; they were also found in ancient Phœnician buildings in Syria, and you may see them to the present day in the prehistoric city which has been discovered beneath three layers of pumice stone and volcanic ashes on the island of Thera, which is by more than 2,000 years older than the beginning of the Byzantine empire in 395 B.C. With regard to other objects of human industry, whoever takes the trouble to examine the illustrations in our book on Tiryns will see that, generally speaking, they are of the same shape, fabric, and manufacture as those of Mycenæ, which all archæologists unanimously attribute to 1200–1400 B.C., with the excep-

tion of the terra-cotta idols, most of which have much more ancient types, with the exception also of the arrow-heads and knives of obsidian, which for rudeness can only be compared to those I found in the prehistoric tumulus at Marathon, erroneously called the tomb of the 192 Athenians who fell in the battle of Marathon (490 B.C.), or to those found in the cave dwellings in the Dordogne in France, which were inhabited at the time of the mammoth. I think it almost superfluous to reply to the objection raised that walls of quarry stone bonded with clay denote barbarian builders of a late Byzantine time, for it can be easily proved that in prehistoric times the lower part of all house walls consisted precisely of this masonry, the upper part being built of sun-dried bricks, for similar walls are found by many hundreds in all the five prehistoric cities of Troy, in the treasuries of Mycenæ, in the thalamos of Orchomenos, in Samos in Cephalonia, in Eleusis, in the Acropolis of Athens, beneath the edifices destroyed by the Persians, and last, not least, in the prehistoric city in Thera. In conclusion, I express the hope that in a short time other eminent scientific men, members of this exalted Hellenic Society, will, after having read our book "Tiryns," take it with them to Greece to ascertain the accuracy of our statements and plans, and my collaborator and I will defer to the judgment seat of this illustrious body to decide on their report whether the result of our hard work at Tiryns deserves to be called "one of the most extraordinary hallucinations of unscientific enthusiasts which literature can boast of," a title which the *Times* correspondent, Mr. Stillman, so liberally bestows upon it. The appreciation of this Hellenic Society will be a great spur and encouragement to us in this new campaign.

Dr. Dörpfeld also contributed a paper, of which a translation was read by Professor C. T. Newton, and which enforced in detail the views lately expressed in the *Times* by Dr. Dörpfeld, and pointed out that all those indications which had been referred to by the *Times* correspondent and insisted upon by Mr. Penrose, as proving the remains at Tiryns and Mycenæ to be of a later date than that which was assigned to them by Dr. Schliemann and himself, such as the tools, and particularly the drill which appeared to have been used, and the mortar and other materials for the building of the walls, were equally apparent in remains at Troy and in Egypt which were admittedly of as high an antiquity as he claimed for the remains at Tiryns and Mycenæ.

Mr. H. F. Pelham then read a paper by Mr. Stillman, the correspondent of the *Times*, in support of the views which have already been expressed by that gentleman.

On the motion of the chairman, a vote of thanks was cordially given to the readers of papers, and especially to Dr. Schliemann, who had come at so great a sacrifice from Athens to London to defend his position against the attacks which had been made upon it.

In the discussion which followed Professor J. H. Middleton expressed a general concurrence in the conclusions of Dr. Schliemann and Dr. Dörpfeld.

Mr. Pelham, who had made himself acquainted with Dr. Schliemann's views and spoke with some experience of excavation in Italy, was disposed to think, though he did not presume to dogmatise, that considerable further evidence was required before Dr. Schliemann's views could be accepted.

Dr. Schliemann, Dr. Dörpfeld, and Mr. Penrose briefly replied to the criticisms passed upon them, and Dr. Karl Blind quoted the opinion of the late Dr. James Fergusson in support of Dr. Schliemann's views.

The proceedings terminated with a vote of thanks to Dr. Evans for presiding.

DOMESDAY BOOK.

THE committee appointed by the Royal Historical Society to carry out the details of the commemoration of the 800th anniversary of the completion of the Domesday Survey, has prepared and issued a circular addressed to local antiquaries, giving information as to the way in which it is intended to celebrate the event in October next. The commemoration will take the form partly of a series of meetings for the reading of papers and the publication of a volume of Domesday studies, and partly of an exhibition of manuscripts at the Public Record Office and the British Museum. The exhibition at the Public Record Office will comprise the manuscript of Domesday Book (two volumes), the Abbreviatio, the Breviate, a copy of the Boldon Book, the Red and Black Books of the Exchequer, the two volumes entitled "Testa de Nevil," early Hundred Rolls, Books of Aids of Edward III., &c. The exhibition at the British Museum will consist of the Survey of Lindsey, Monastic Cartularies containing surveys, Inquisicio Eliensis, transcript of the original Domesday return for Cambridge, printed editions of the survey and translations, and, it is hoped, loan contributions from other libraries. As it is desirable to make this exhibition as complete as possible, the committee hope that the owners of all manuscripts bearing on the subject of Domesday will lend them for the purpose. The principal librarian of the British Museum has consented to take charge of anything that may be sent to him for this purpose. As a permanent record of this commemoration, it is proposed to compile a bibliographical list of existing works relating to Domesday Book, which will include brief descriptions of the various Domesday manuscripts, with references to their places of deposit and the titles of all papers and pamphlets on the subject. The following is a list of the chief subjects on which it is proposed that papers shall be read:—"The History of the Manuscripts of Domesday and their Custody," "The Purpose, Occasion, and Objects of the Survey," "The Order of the Compilation," "Geographical Limit of the Survey, and the Cause of the omission of certain Districts," "Ancient Demesne," "The Boroughs and Cities," "Changes in the Extent and Names of Shires and Hundreds," "The Distribution of Socage Tenure throughout the Country," "The Lands laid Waste in the North," "Industrial Condition of England," "Population," "The Church in Domesday," "The Magnates of Domesday," "The Classes of Tenants," "The Danegeld and the Fiscal System of Domesday generally," "Legal Forms in Domesday," "The Clamores, Occupationes, and Invasiones," "Courts and Jurisdictions," "The Measures of Land," and "Comparison of the Domesday Survey with other Surveys, such as the Exon Domesday, Winton Domesdays, Gheld Inquest, Gloucestershire Fragment, the Inquisitio Eliensis, the Liber Niger of Peterborough, the Survey of Lindsey, and Boldon Book."

THE PREHISTORIC BOAT.

ON Tuesday, Mr. Justice Chitty delivered judgment in the case of Elwes *v.* the Brigg Gas Company, and thus determined the ownership of the ancient boat which was found embedded in the bank of the river Ancholme at Brigg. His lordship said the parties concurred in the statement, more or less conjectural, that the boat was some 2,000 years old, and that, having been abandoned or left derelict by the original owners on what was now the bank of the river Ancholme, it became, by the operation of natural causes, such as by sinking in the ooze and the deposit of alluvial soil, buried in the earth, and so it remained for many centuries, until it was recently discovered and excavated by the defendants. When discovered it was lying embedded in the clay, at a depth from the surface of 4 feet at one end and 6 feet at the other, and when brought to the surface it appeared to be a boat of rude construction, 45 feet in length, hollowed out of a single oak tree. The wood had not become petrified or fossilised, but retained the properties of wood. During the hearing the question had been discussed as to whether the boat, just previously to its discovery, ought, in point of law, to be considered as a mineral or as part of the soil in which it was embedded, or as still retaining the character of a chattel. It was one or other of these three things. In his lordship's opinion, it was, for reasons to be given, not actually necessary to give a decision on that discussion. In support of the contention that the boat was a mineral, reference was made to the case of Hext *v.* Gill, and to the statements in the judgment of Lord Justice Mellish (with which Lord Justice James concurred) that the term "minerals" included every substance which could be got from underneath the earth for the purpose of profit. The terms of such a definition were wide enough to include the boat; but he was not aware that the term "minerals" had ever been held to include anything except that which was part of the natural soil. Unquestionably coal was deemed in law a part of the natural soil, without regard to what geologists might show to have been its origin. In law the natural processes by which the trees of a forest had become coal were not investigated; the result only was considered. But the boat had not become petrified or fossilised. It had always been distinguishable from the natural soil itself. If, therefore, he were required to decide the question he should hold that it was not a mineral. In support of the contention that it ought to be deemed at law as part of the soil in which it was imbedded, reference had been made to the principle embodied in the maxim "Quicquid plantatur solo," or, as it was sometimes stated, "Quicquid fixatur solo, solo cedit." That principle was an absolute rule of law, not depending on intention. For instance, if a man dug in the land of another, and permanently fixed in the soil stones or bricks or the like as the foundation of a house, the stones or bricks became the property of the owner of the soil, whatsoever might have been the intention of the person who had so placed them there, and even against his declared intention that they should remain his property; nor did it appear to be material that the things should have been placed there by the hand of man, but it would seem to be sufficient if they had become permanently

fixed in the soil by the operation of natural causes. In support of the contention that the boat always remained a chattel it was urged that, though embedded in the soil, it always was distinguishable from the soil itself, and preserved its original character of a chattel. It certainly was a chattel now. Not long ago, in the course of making excavations in Hampshire, there was discovered a jar containing Roman coins—not gold or silver coins, and therefore not falling within the royal prerogative of treasure-trove. Apparently the coins formed the small change of the treasure of a Roman legion. Could it be said that the jar or the coins were part of the soil within the principle referred to? Similarly, a short time since there was found beneath the soil (his lordship believed in Devonshire) a Roman lamp of ingenious construction made of lead and in an excellent state of preservation. Could it be said that the lamp was part of the soil? Such questions, although interesting, need not be decided in the case before him. The first question which did actually arise in the case was whether the boat belonged to the plaintiff at the time of the granting of the lease. He held that it did, whether it ought to be regarded as a mineral, or as part of the soil within the maxim above cited, or as a chattel. If it was a mineral or part of the soil in the sense above indicated, then it clearly belonged to the owner of the inheritance as part of the inheritance itself. But if it ought to be regarded as a chattel, he held the property in the chattel was vested in the plaintiff. He was entitled to the inheritance and in lawful possession. He was in possession of the ground, not merely of the surface, but of everything that lay beneath the surface down to the centre of the earth, and, consequently, in possession of the boat. The principle of the decision of the Court in "Reg. *v.* Rowe" appeared to apply. There the question was whether the property in some iron lying at the bottom of a canal was well laid in the indictment in the land company. The water had been taken out for the purpose of cleaning the canal, and the prisoner was indicted for stealing the iron, which had been dropped into the canal by the owner. The Court held that the canal company had a sufficient possession of the iron to support the indictment. If the fact of the iron having been left on the surface of the ground covered by water was sufficient to give in law possession of the chattel to the person in possession of the land, it appeared *à fortiori* to follow that the facts of the present case justified a decision that the plaintiff was in possession of the boat. For the boat was embedded in the land; a mere trespasser could not have taken possession of it; he could only have come at it by further acts of trespass involving spoil and waste of the inheritance. The plaintiff, then, being thus in possession of the chattel, it followed that the property in the chattel was vested in him. Obviously the right of the original owner could not be established; it had for centuries been lost or barred, even supposing that the property had not been abandoned when the boat was first left on the spot where it was found. The plaintiff, then, had a lawful possession, good against all the world, and, therefore, had the property in the boat. In his opinion it made no difference, in those circumstances, that the plaintiff was not aware of the existence of the boat. The defendants' claim must, then, rest on the lease and what had been done or had occurred since it was granted, including the finding of the boat. By the mere demise the boat did not pass to them, a lease being only a contract for the possession of the land. The defendants discovered the boat in making excavations pursuant to their documentary contract. The contract was however silent as to what was to be done with the soil excavated. In the circumstances, some permission ought to be implied as to the removal and disposal of what might be excavated. The question was as to the extent of this implied permission. As against the lessors, the permission ought not to be carried beyond what might be reasonably inferred to have been the intention of the parties. The excavations were to be made to a depth of 15 feet. Obviously it was not the intention of the parties that the soil excavated should be piled up on other parts of the small plot of ground comprised in the lease. The implied permission to remove and dispose ought then to extend to what the parties might fairly be deemed to have contemplated would be found in making the excavations, but did not extend further. He was of opinion that the license to remove and dispose extended to the clay and ordinary soil likely to be found when excavating in pursuance of the license, but did not extend to what was unknown and not contemplated. If the boat ought to be considered as a mineral, though that was not his opinion, then it fell within the exception of minerals contained in the lease itself and was expressly excluded by the lease. If, however, the boat ought to be considered as part of the soil by reason of its having becoming permanently fixed thereto, or if it ought to be considered as a chattel it was equally excluded, for it would be unreasonable to infer that it was intended to be included in the lease. Further, if it ought to be regarded as a chattel the defendants did not acquire any property in the chattel by the mere finding as against the plaintiff who, upon the grounds already stated, was the owner of the chattel. For these reasons he held that the plaintiff was entitled to the boat.

HOSPITAL HUTS *v.* BRICK BUILDINGS.

IN his latest report on the sanitary condition of Kensington, Dr. Duffield, the Medical Officer of Health, writes:—From time to time I have referred to the proceedings of the Asylums Board in regard to provision of hospital accommodation for smallpox patients, and in my report dated March 2 I alluded to the intention of the managers to proceed at once to the erection of a permanent hospital at their Gore Farm Estate, Darenth, all difficulty having apparently been removed, by the failure of the plaintiffs in the appeal case, Fleet *v.* The Managers, to get the judgment of Mr. Justice Pearson reversed.

I have now to report that the Local Government Board have intervened in a manner to put a stop to further proceedings for the present, by having addressed a letter to the managers respecting the proposed hospital (plans for which had previously received their assent), to the effect that they "are advised that the present condition of medical opinion with regard to the construction of smallpox hospitals, and to the number of patients whom it may be desirable to treat under one administration, is so far undecided as to render it inexpedient to expend larger sums than may be found absolutely necessary on structures which further experience may show to be not wholly suited to their purpose." The Board, therefore, propose "that whatever provision is made at Darenth site for future epidemics should rather be in the form of huts than of brick buildings," offer suggestions with reference to the utilisation of the huts in the possession of the managers, and the erection of others, and request the managers to give further consideration to the subject. The Chairman of the Board naturally enough animadverted on the new position taken up by the Local Government Board in advising the managers to go back to the erection of huts after the long experience which had been obtained as to their cost, and the difficulties of administration under this system. Resolutions were adopted referring the letter to a committee, and stopping all preparation of plans. It may be mentioned that the estimated cost of the permanent hospital is about 120,000*l.*, that the encampment in 1884-85 cost in round figures, 40,000*l.*, and that any re-establishment of it would necessarily involve a considerable outlay, it being alleged that the buildings and tents of which the two camps were composed are not worthy of being re-erected. As a matter of fact, however, huts with accommodation for 350 patients are still standing and in fair condition. As the site will assuredly be retained and used in epidemic times, it would appear to be desirable that an administrative block should be erected without loss of time, whatever may be the ultimate decision in regard to other buildings of a permanent character.

EXCAVATIONS IN POMPEII.

A CORRESPONDENT writes as follows to the *New York Journal of Commerce*:—

It seems odd to speak of a dead city as a growing one. But that is exactly the case with Pompeii. There are many cities in Italy that do not grow half as fast as the one buried by the ashes of Vesuvius 1,800 years ago. A person visiting it at intervals of a year notices a marked enlargement of its boundaries. The Italians, you know, are the champion diggers. They make the shovel fly when they attack the grave of Pompeii. We saw a gang of them at work there. A Government overseer watched them like a hawk. He wanted to be sure that they pocketed no jewelry, coins, or objects of art or utility yielded by the excavations. The only produce of their toil in that line as we stood by was a bit of iron, which the guide called a hinge, and the fragment of a small marble column. The spades busily plied were gradually bringing to light a beautiful house. The floors were mosaic, with simple but graceful designs in scroll pattern—nearly as fresh of colour as if laid yesterday. The walls bore frescoes of fainter tints—grinning masks, fawns, cupids, birds, fish, and fruit. It had evidently been the home of a well-to-do citizen of Pompeii. The nervous movements of the workmen betrayed their anxiety. They were hoping at every moment to make a valuable "find." Perhaps they might hit upon a great iron chest, studded with round knobs like a boiler, and full of gold, money, or ornaments, or they might strike another wonder in marble or bronze, or they might be startled by coming suddenly upon a skull or other human remains. In the latter event, the work is suspended till a careful inspection is made.

The responsible and intelligent person in charge proceeds to ascertain if the dead Pompeiian has left a mould of himself or herself in the plastic ashes. If so, he prepares a mixture of plaster of Paris, breaks a hole in the crust, and slowly pours in the liquid till the mould is full. When it has hardened the casing is tenderly removed. Lo! there is a rough image, showing some poor creature in the agonies of death, prone on the floor, face downward.

Thus, most usually, were the inhabitants of the doomed

city caught by the destroying angel. The skull, or leg, or arm, or whatever other part of the skeleton has not relapsed into its original dust, may attach itself to the plaster cast in the proper place, or may require to be joined on by a pardonable "restoration." In either case, the effect is thrilling in its horrible reality. Nothing in painting or sculpture can shock the beholder more than these self-produced and truthful statues exhibited in the museum, which is the first and most interesting thing shown to visitors. But, though neither gold nor silver, nor the minutest scrap of a skeleton, nor anything else of importance was unearthed for my benefit, I quitted the new excavations with reluctance to examine those parts of Pompeii with which the world is already familiar, through the medium of books and pictures. I found myself quite at home in the bakery, the wine shop, at the oil merchant's, at the houses of Pansa, of Sallust, of the "Tragic Poet," and the rest. The high stepping-stones across the streets looked familiar, as if I had trodden them before. The deep ruts cut by the carts as they groaned up the hill, coming from the ancient Stabia, were like friendly landmarks. So fully have literature and art made us acquainted with this disinterred city.

The guide tells me that only about one-third of Pompeii has yet been uncovered. I take his word for it. He is also of the opinion that the best parts of the city have already been dug out. He evidently wishes that the work would stop. He is very human in this, for he finds it tiresome to show people about the present Pompeii. Treble its size, and his labour would be threefold. And he is forbidden to accept money. But I imagine that this very stern prohibition does not prevent persons from offering him (say) a couple of francs on "the sly," or him from accepting them.

It may be true, as our guide insists, that the temples, forums, baths, theatres, and fine houses now above ground surpass anything of the kind that may hereafter be discovered at Pompeii. But the Italian Government is not disposed to take that for granted. Liberal sums are yearly appropriated to push on the work. It bears fruits. A new temple or amphitheatre may not be struck every year, but something is constantly being turned up to instruct the world in the manners and customs of the old Romans, so well reflected in the representative city of Pompeii. Of bronze or stone statues, household implements, and tools of trades the yield is immense and steady. These may be counted by the thousand in the splendid museum at Naples. One can see so many articles of luxury and use exactly similar to those he buys nowadays, that he is fain to pause and try to remember what besides the steam engine, the photograph, and the electric telegraph we moderns have invented. There being no more room at Naples to store these treasures, the excess of them is huddled together in the courtyards and houses of Pompeii herself. It is estimated that at the present rate this mine of antiquities will not be worked out in fifty years.

Correspondence

The Æolus Waterspray and General Ventilating Company.

Sir,—Will you permit us to state that the petition presented for the liquidation of the Æolus Waterspray and General Ventilating Company, Limited, has no connection with or reference to the business of our client, Mr. Richard Oakley, trading as the Æolus Waterspray General Ventilating and Electrical Engineering Company, 235 High Holborn, to whom all the interests in the British patents of the limited company were transferred so far back as March 1884?—Your obedient servants, Johnson, Harris & Dowding.

3, 4, and 5 Queen Street, Cheapside, E.C.:
June 29, 1886.

CHURCH BUILDING AND RESTORATION.

Cheadle.—St. Giles's Church has been reopened after restoration. The work has been carried out from the designs and under the superintendence of Messrs. Thomas Lewis & Son, architects, Newcastle-under-Lyne. A new oak pulpit, supplied by Messrs. Jones & Willis, London and Birmingham, has also been fixed. The general contract was undertaken by Mr. A. P. Cotterill, of Crewe. Mr. J. Jackson, Newcastle, supplied and fixed the heating apparatus.

Exbourne.—The old church of St. Mary has been reopened after restoration of the chancel and partial renovation of the nave. The style of the church is Late Decorated, and one of its features is the fine west tower. The works have been done by Mr. W. Pethrick, of Hatherleigh, under the direction of Mr. R. Medley Fulford, of Exeter.

Glasgow.—A new Established church has been opened at Possilpark, having been built from designs by Mr. David Thomson, architect, Glasgow. The contractors employed were—For mason work, Messrs. Leckie & Co.; joiner, Mr. James Laidlaw; plumber, Mr. John Young; plasterer, Mr. Alexander Brown; slater, Mr. William Darrie; painter, Messrs. John Brabner & Co.; gasfitting, Mr. Archibald Watson; heating, Messrs. Cormack & Sons. Ventilation is effected by the introduction of Buchanan's sunlight ventilators.

Leicester.—The church of St. Barnabas, New Humberstone, has been opened. The architects are Messrs. Goddard & Paget, of Leicester, the principal contractor being Mr. G. Hewitt, of Humberstone Gate. Sub-contractors—Messrs. Thrall & Payne, stonework; Mr. S. Wilmott, woodwork carving; Messrs. Elgood Brothers, ornamental ironwork. The gas fittings are by Messrs. Webb & Son, Leicester. The bell was cast by Messrs. Taylor, of Loughborough, and the tiling was supplied by Messrs. Ellis & Partridge. Mr. J. Clifton acted as clerk of works.

Liverpool.—The new church of St. Polycarp has been opened. The church, which is Early English in style, will accommodate 600 persons, and has been built by Messrs. Brown & Backhouse from the designs of Mr. George Bradbury, at a cost of about 4,000*l.*

Manchester.—The foundation-stones of a new Wesleyan chapel to accommodate 800 persons have been laid at Moss Side. The building will be of brick with stone and terra-cotta dressings. The work is being carried out by Mr. L. C. Webster, of Chorlton-on-Medlock, from the designs and under the supervision of Messrs. Dunk & Geden, architects, London.

Newbottle.—A new church erected at Newbottle has lately been opened. The building is of stone, with a slate roof, the style adopted being Early English, and the church is furnished with seats to accommodate 568 persons. The architects are Messrs. Oliver & Leeson, of Newcastle, and Messrs. Hirst & Sons, of Sunderland, are the contractors.

Northampton.—A new church has been opened in St. Michael's Road. The building, a handsome structure, capable of accommodating about 1,060 persons, was designed by Mr. S. J. Newman, A.R.I.B.A., of Abington Street, and the work has been carried out by Messrs. Reynolds & Son, the cost of the undertaking, including the site, being about 4,100*l.*

Scarborough.—A Wesleyan church has been opened, having been built at a cost of about 5,000*l.* It was designed by Messrs. Morley & Woodhouse, architects, Bradford, and the work has been carried out by the following contractors:—Masonry and plastering, Mr. W. Peacock; joiners' work, Mr. Scales; plumber, Mr. Stephenson; painter, Mr. Wrightson; upholsterers, Messrs. Tonks; heating, &c., Messrs. Waters & Woodhouse, all of Scarborough. The church comprises nave, chancel, transepts, and tower and spire; the style is of the Mediæval character, and the building will accommodate 550 persons.

Swanage.—A new Wesley Memorial Church was opened in this town on Thursday, the 1st inst. The building is of the hard local stone, with Langton and Portland stone dressings outside, while the interior dressings are in Monk's Park Bath stone. It is in the style of late French Gothic, and has a tower and spire some 110 feet high. A very handsome Caen stone pulpit or rostrum, worked to the designs of the architects, has been executed and given by Mr. R. Webber, of Clapham Road, London, and a three-light window over has been filled with really fine stained glass representing Faith, Hope, and Charity, the authors of this being Messrs. G. & A. Lucford, of Kentish Town. The whole of the visible woodwork is in oak and pitch pine. The accommodation is about 530, including the end gallery. The cost of the building, including the value of work and materials given, will amount to some 4,250*l.* The church, with which the inhabitants of the town are extremely pleased, has been carried out by Messrs. Wellstead & Griffin, of Swanage and Broadstone, and the architects are Messrs. Bucknall & Jennings, of Swansea and Bristol.

NEW BUILDINGS.

Belfast.—New premises have been erected in the Royal Avenue, Belfast, for the proprietors of the *Evening Telegraph* The entire contract has been carried out by Messrs. H. &. J Martin, Ormeau Works, Belfast, from the plans and under the personal superintendence of the architect, Mr. Henry Seaver, of 35 Royal Avenue, a rising member of the profession in Belfast. The new buildings occupy the site next the Free Library, at the junction of Royal Avenue and Little Donegall Street, having a frontage of 76 feet 6 inches to the former, and 101 feet 6 inches to the latter street. The edifice is 79 feet high,

and is understood to be the loftiest in the Avenue. It is considerably more spacious in the rear than in the front, the width at the back being 83 feet. The materials used in the construction of the principal elevations are red sandstone, from the Dumfries quarries, the subsidiary parts being carried out in red perforated brick from the Ormeau Works. The style adopted has been a free treatment of the Classic period. The main façades have been designed so as to divide into a series of bays of equal spans and bold proportions rising almost the full height of the building. These bays are separated by rusticated pilasters standing out from the line of building, and rising to a height of 48 feet, terminating with richly carved and moulded capitals in the composite order; from these spring semicircular stone arches with elaborately moulded labels. These arches are surmounted by a richly-designed and boldly-projecting stone cornice having cantilever blocks with enrichments of moulded brick and tiles. Above the main cornice rises a well-proportioned parapet wall, broken at intervals by dormers of imposing dimensions. The arrangement of the various departments has been carefully studied, as also the fitting up of the establishment. The stereo-room has been specially designed so as to guard against any possibility of fire spreading to the rest of the building. The walls surrounding this department are carried through the roof; the floor being composed of concrete resting on iron beams, and the doors are of iron.

Bucknall.—A new infectious diseases hospital, erected jointly by the local authorities of Hanley, Stoke, and Fenton, at Eaves Lane, Bucknall, has been opened. It is built on the pavilion system, and consists of five separate pavilions, and will accommodate twenty-eight beds, and at a push this number might be increased to forty, as the quantity of air space, viz., 2,000 cubic feet, and floor space 144 square feet, is based on the extreme limit. The administrative pavilion is a two-storey building, and comprises on the ground floor a dispensary, waiting-room, living room for attendant, kitchen, scullery, larder, and store closets; and on the upper storey, six bedrooms, bathroom, and airing closet. In this block there is also a fire hydrant, with length of hose capable of reaching to any of the pavilions. The laundry block contains wash-house, drying-closet, disinfecting-closet, ash-place with riddling-machine, coal and wood house, room for the storage and chopping of straw used for filling mattresses in the hospital wards, ambulance house, and mortuary. The disinfecting closet, the apparatus for which has been supplied by Messrs. Thomas Bradford & Co., of London and Manchester, is on an entirely new principle. The process is carried out by means of super-heated steam, thus doing away with the slightest danger of scorching the clothing. The drying-closet is heating by a stove, serving also for the purpose of heating the irons for the ironing-room. In the ash-place the finer portion of the ashes after being riddled by means of the riddling-machine is mixed with earth dried on the kilns, the heat to which is supplied from the coarser portion of the ashes, and afterwards utilised for the earth closets provided throughout the hospital. The space occupied by the hospital is in the whole about $6\frac{1}{4}$ acres, of which $4\frac{1}{4}$ acres are used for the hospital buildings and grounds, the remainder being devoted to the disposal of the sewage by irrigation. Particular attention has been paid to the ventilation and heating of the various wards and rooms throughout the entire hospital. The fresh air is admitted through hinged zinc inlets, provided with baffle plates, and by means of an improved construction of the windows, whereby one sash may be raised to allow the entrance of air between the two without causing the slightest draught at the bottom. In the wards gratings are also provided under each bed. The foul air is extracted by means of Kite's patent roof-ventilator, and by separate ventilating flues in each chimney-stack communicating with the room. The heating is effected by means of the Manchester grates—two of which in the wards are placed in the centre of the room. These contain at the back of the fire a hollow space which is supplied with fresh air conveyed in pipes from the outside and delivered warm into the room through a grating over the mantelpiece. The walls are built with picked common bricks, with quoins and angles of pressed bricks. The gables are tiled and half-timbered, with plaster working between. The architect for the buildings was Mr. G. W. Bradford, of Miles Bank Chambers, Hanley; the principal contractor, Mr. J. Gallimore, Newcastle; clerk of works, Mr. Leonard Price.

Tillyfour Castle, Aberdeenshire.—Mr. F. Gregson has restored the ancient baronial castle upon that estate as a residence. The remains of the old structure have been restored, and a large addition made thereto in exactly the same style of architecture. The building, now approaching completion, is consequently irregular, with the old castle as the principal feature, the additions being of the height of two storeys, and the whole structure having a frontage of 174 feet. The castle contains two halls, one in the low floor, 30 feet by 19 feet, and one in the upper floor, 30 feet by 20 feet. Throughout, the internal walls of the building are panelled with oak. The ground around the castle has been nicely laid out, and a new approach made to it along the side of the Don. The building is designed by Messrs. Wardrop & Anderson, Edinburgh, and will cost about 10,000*l.* The contractors are—mason work, Messrs. Pringle & Slessor, Aberdeen; joiner work, Messrs. Beattie, Edinburgh; plasterer work, Messrs. Kirk & Pigot, Aberdeen; plumber work, Mr. Proctor, Edinburgh; slater work, Mr. George Davidson, Aberdeen.

ARCHÆOLOGY.

Old Rome.—In making a deep cutting at the Chester Gas Works for the new gasholder tank, when the cutting had reached a depth of 23 feet below the surface, a pig of Roman lead was discovered in a state of excellent preservation. The inscription it bears along the upper surface is as follows:—IMP VESP AVG V T IMP III., while on the side is inscribed DE . CEANGI. Its weight is 192 lbs. The translation of the inscription is that it was a pig of lead, a tribute from the tribe in North Wales commonly known as the Ceangi to the Roman power. The inscription points to its being cast during the fifth consulate of the Emperor Vespasian, and the third consulate of Titus, or the year A.D. 74, and consequently it may be assumed that the lead has been lying where it was found some 1,800 years. The ground wherein it was discovered was gravel and marl, which evidently formed part of the old river bed. The spot is some 140 or 150 feet within the present river wall. Fragments of Roman tiles and Roman pottery were also picked up, and several Roman coins of the time of Vespasian and Titus, wonderfully fresh. A similar pig of lead, cast in the same year, and a tribute from the same tribe, is in the possession of the Duke of Westminster, at Eaton, and was found in 1838 on the Tarvin Road.

GENERAL.

The Slade Fine Art Scholarship in University College, London, has been won by Mr. C. D. Hay Campbell, of Edinburgh.

Mr. J. E. Boehm, R.A., has been commissioned to prepare a new Royal portrait medallion for the Imperial coinage.

A Statue of Lamartine, by M. Marquet de Vasselot, was on Wednesday unveiled at Passy.

The Society of Arts Conversazione will be held, by permission of the Royal Commission, at the Colonial and Indian Exhibition, South Kensington, on Friday next, the 16th inst.

An Autumn Exhibition of Modern Pictures will be opened in Nottingham on September 11.

A Wholesale Fish Market is contemplated to be constructed on the site of Lucas's Repository, Liverpool.

The Wing of the Brussels University containing the great Academic Hall was destroyed by fire on Wednesday. The building, once the historic palace of Cardinal Granvella, was inaugurated as a university fifty-two years ago. The greater part of the library has been destroyed in the fire.

The Leicester Town Council have adopted a scheme by Mr. J. Gordon, C.E., for the reconstruction of the borough sewerage.

Mr. E. Mirfield, of East Bierley, has offered to provide a mechanics' institute for that town, the cost of the undertaking being estimated at about 2,000*l.*

Count Francesco Vespignani has been appointed architect of the papal palaces in recognition of his care in superintending the works of restoration in the apse of St. John Lateran. The office has been vacant since the death of Signor Fontana.

The Richmond Vestry, on Monday, decided to ask the Corporation of London to purchase the grounds belonging to the Duke of Buccleuch, near Richmond Hill, in order that the place might be made a recreation ground.

The Hospital Committee of the Liverpool City Council have agreed to appoint an assessor or assessors to report on the designs for the proposed hospital for infectious diseases in Grafton Street.

The Annual Meeting of the Lincoln and Nottingham Archæological Society opened last week at Lincoln.

Mr. T. L. Worthington, of Manchester, has obtained the Donaldson silver medal in the fine art section of Professor Roger Smith's courses, and Mr. R. L. Pearce the Donaldson medal for construction.

The Metropolitan Board of Works have decided that the salary of the superintending architect is to be 1,500*l.* a year, inclusive of travelling and incidental expenses; that the age of the person to be appointed be not less than 35 and not more than 50 years.

The Architect.

THE WEEK.

The exhibition which was held for months in one of the wooden buildings on the site of the Tuileries was closed on Saturday. The proceeds were intended to be devoted to raising a monument to Claude Lorraine. As the price of admission on Sundays was only a quarter of a franc, and on week days a half franc, a large number of visitors must have passed the turnstile. The contents were offerings from artists, and were another proof of the generosity of the French painters whenever an appeal is made to them. In some cases pictures of good size were given, but the majority of the works were studies. They were as much a tribute to M. Français, the landscape painter, who organised the project, as to Claude. Costly books on art were given by amateurs. The whole of the works are to be distributed among the subscribers by means of a lottery in November, the price of each ticket being 20 frs. It is guaranteed that the purchaser of twenty tickets will have at least one prize.

This year's national fête in Paris has brought honours to some artists. M. Paul Dubois, the sculptor, has been raised to the dignity of a commander of the Order of the Legion of Honour. M. Boisseau, also a sculptor, is nominated a chevalier, and the honour ought to have been awarded at an earlier date. M. Yon, the painter, has received a similar distinction, as well as M. Pouzadoux, who has charge of the modelling and casting for the Museum of Comparative Sculpture in the Trocadéro. M. Bœswillwald, the well-known diocesan architect, is named a chevalier, while M. Baudot, inspector-general of diocesan edifices, is elevated to the grade of officer. Among the officials rewarded are M. Ronchaud, director of the national museums, and M. Hecq, chief of the secretariat in the department of fine arts and civil buildings under the Minister of Public Instruction.

The local authorities of Merthyr Tydfil have adopted the report of the Town Hall Committee recommending the design submitted by Mr. E. A. Johnson, of Abergavenny and Newport, for the municipal buildings, and he has been awarded the prize of 50*l*. Fifteen other designs were also submitted. The building will cost nearly 12,000*l*.

The Municipal Council of Paris are in favour of having the proposed metropolitan railway constructed underground, like the London line. But the Government are opposed to this view, and are about to introduce a scheme in which tunnels will be absent. A journey through the London tunnels is not a pleasure trip, and we can easily imagine the discomfort endured by the deputation from Paris when they first made the experiment. But an underground line would have the great advantage of allowing Paris to remain in all its beauty, and experience shows the difficulty of constructing viaducts that will gratify the eyes. Is it desired to have a repetition of what is to be seen at Ludgate Hill and on the Thames? The objections of the municipal councillors are deserving of approval by every one who is eager to uphold the amenity of the city. It should also be remembered that it is now possible to construct a subterranean line with better ventilation than exists in the Metropolitan Railway. The necessity of the new railway is not self-evident; but if it is to be constructed for the sake of giving employment, it should be laid out in such a way as to cause no regret hereafter.

The opening of the Corporation Art Gallery was celebrated in a characteristic way on Monday by a dinner, at which Sir Frederick Leighton was one of the guests. The President acted with his usual good sense in considering the gallery as no more than a step in the right direction. All honour was due to the Corporation, he said, for having provided a decorous abode for the works of that collection; but they would not remain content with that. They would not be content that it should represent so few of the living energies of the English school, still less would they—the most wealthy and open-handed Corporation in the world—suffer and tolerate that the catalogue should remain a record of the generosity of private individuals and not of the public munificence. To any one who reads between the lines the meaning of the President's words will be plain. The contents of the gallery are not worthy of the richest city in the world, nor is it right for the Art Committee of the Corporation to begin housekeeping with doles, as if they were a charitable society. The authorities of the humblest town in France spend more money on art every year than the Corporation of London.

The President of the Society of Antiquaries lately applied to General Pitt Rivers, the Inspector of Ancient Monuments in Great Britain, for information about bringing remains under his care. The following reply was given:—"Clause 10 of the Ancient Monuments Act of 1882 makes provision that any monument of like character to those scheduled may by Order in Council be deemed to be an ancient monument to which the Act applies. Should the Society of Antiquaries desire to recommend any additional monuments to be included in the schedule, I write to inform you that on receiving a list of such monuments from the Council of the Society I will lay it before the Commissioners of Works, with a view to obtaining their consideration of the matter. It would greatly facilitate matters if the names of the owners of the monuments could be appended to the list, and it would be an additional advantage if the Council, through their members, could obtain the consent of the owners to having the monuments placed under the guardianship of the Commissioners of Works."

The Council of the Society of Antiquaries have accordingly appealed to the local societies for advice and assistance in the matter. The preservation of such monuments is of the highest importance, and in order to insure it, the concurrence of the owners in placing them under the protection of the Act is highly desirable. The Council trust that the local knowledge of the members of the archæological societies throughout the country will not only assist in extending the schedule of the monuments brought under the Act, but will aid in insuring a favourable acceptance of the provisions of the Act by the owners of these interesting relics of the past.

The members of the Norwich Art Circle are doing a service to art by holding exhibitions from time to time of members of the Norwich school. This time John Thirtle's works have been selected. His name is no longer familiar except to a very few connoisseurs. Thirtle was born in 1777; was the son of a shoemaker, and is believed to have been apprenticed to a London picture-frame maker; and was one of the original members of the Norwich Society of Artists, of which John Crome was the head. Five works of his are named in the catalogue of the first exhibition, held in 1805. Soon afterwards he set up in business as a carver and gilder, eking out his means of life by painting and giving drawing lessons, and constantly exhibiting at the Norwich shows. Once, in 1808, he had a picture in the Royal Academy. Four years later he married a sister-in-law of J. S. Cotman, and in 1815 he formed one of the seceding group which, after an unhappy quarrel not unprecedented in artistic circles, left the original society. He was a good portrait-painter and a charming landscapist in water-colour, his drawings being full of observation and treated with a freedom, breadth, and delicacy that are really remarkable.

A paper which was read by Professor Fream at a conference at the Colonial and Indian Exhibition suggests that the experiments which have been made by the Government in forestry have been fairly rewarded. In New South Wales a department was established in 1877. The total expenditure up to 1884 was 75,923*l*., while the revenue was 85,992*l*. In Victoria there was a larger profit, for in 1883 the expenditure was 2,538*l*. and the revenue 8,580*l*. In South Australia the income balances the expenditure, but trees are not planted entirely for sale in that province.

IRISH INDUSTRIAL RESOURCES.*

FORTY years have gone by since Dr. Kane, who was at the time a Professor of Natural Philosophy and Chemistry, published his "Industrial Resources of Ireland"—a book which was based on lectures given before the Royal Dublin Society. It was considered a sort of revelation, for up to that time the material resources of the island were taken on trust by the majority of the inhabitants. Dr. Kane was not the first who investigated the subject. When, for example, he spoke of building-stones, he made use of the elaborate experiments which had been instituted by Mr. George Wilkinson, the architect of the Poor Law Commission. But the "Industrial Resources" was the first comprehensive summary of the natural wealth of Ireland in all the forms which related to agriculture and manufactures.

Dr. Kane (he has since been knighted) was compelled to raise the question why in a country containing so many elements of wealth the people remained poor, and he had to acknowledge that the chief cause was ignorance. "The fault is not in the country," he said, "but in ourselves; the absence of successful enterprise is owing to the fact that we do not know how to succeed." And he quoted the authority of the Belgian Minister, M. Briavionne, who strenuously urged the Belgian Legislature to attend to industrial education, lest Belgium should become a second Ireland.

An effort was made by the Government of that day to supply the needed industrial education. The first of the teachers was Professor W. K. Sullivan, who was one of the ablest of the many chemists trained in Liebig's laboratory. It was no disadvantage to the new Professor that he was suspected of sharing political opinions with the younger men of that period. Professor Sullivan laboured hard for industrial education, but there was a prejudice in the country which was not to be overcome. Ireland is the land of gentility, and her sons do not care to demean themselves by taking up anything which is not genteel. As far back as 1853 we find the Professor saying that he would be satisfied if he could persuade even a few of the public to believe "that the prosecution of industry is a noble occupation, which in our days, and in countries like Ireland, requires, perhaps, a greater combination of skill and knowledge than the so-called learned professions, and that an unbounded field lies open to skill and industry in Ireland." A great many costly educational experiments have been made during the years which have elapsed since those words were written, but they have all failed in producing captains as well as soldiers of industry. Let us hear Professor Sullivan describe the kind of education which is in vogue now in Ireland:—

> To judge by the present provision for intermediate and higher education in Ireland, it would seem as if all the youth of the country were destined to be clergymen, physicians, lawyers, or civil servants. Industry has certainly no place in it. Our whole educational system is out of gear with the wants of the country. Our agricultural emigrants, male and female, are about the most unskilful emigrants from any country, and are only fitted to do the rudest labour; our town emigrants at best are imperfectly trained artisans or poorly educated clerks. At home the sons of farmers and small shopkeepers strive to escape not alone from their father's business, but from all industrial pursuits, and when unable to obtain a profession they seek for a place, however humble, in the Civil Service or even in the police."

A people who are in so abnormal a condition can hardly help being disaffected. They have no definite aims or hopes, and as they have little to risk they need not be much afraid of change in any form. Hearing so much about legislation, it is not surprising that they have a superstitious faith in the power of Acts of Parliament, as if clauses could be framed to convert bogs into dry pasture or to prevent foreign competition. It was not, however, on legislative feats that Dr. Kane relied to make Ireland rich and happy in 1844, and in that respect Dr. Sullivan resembles his predecessor in Queen's College. A chemist takes a view of cause and effect which does not correspond with that of a member who is as anxious for the victory of his party as if he took part in a hurling match between two parishes: one believes in natural laws, and is assured that they cannot be set aside by any verbal feats of the parliamentary draughtsman, and in Ireland natural laws are found to prevail in a rigorous form.

Indeed, one of the differences between the two treatises on the "Industrial Resources of Ireland," by Professors Kane and Sullivan, consists in a recognition due to increased knowledge of the difficulties which in the nature of things attend every effort to make the island productive. It is not the wonderful country overflowing with milk and honey which the Nationalist poets describe. Here and there are fertile districts, but even the Golden Vale itself cannot hold a position with its produce in the modern markets without adopting some of the lessons of scientific agriculture. If Ireland possessed any extraordinary advantages, either above or below ground, we may be sure that Englishmen would have been tempted to speculate in utilising them. Under the best of conditions the inhabitants need much exertion to gain a modest amount of profit, but it is amidst circumstances of the kind that manly courage is best developed.

Let us take, first, motive power and fuel. In Sir Robert Kane's book the enormous water-power of the island is estimated. The Shannon between Limerick and Lough Allen represented by itself 38,667 horse-power in constant action, while the total power of the island, assuming it to be acting day and night all the year round, was put down at 1,248,849 horse-power. At the time all the English mills had engines with only 83,000 horse-power. The greater part of the Irish water was, and is, wasted. Sir Robert Kane adopted suggestions from English hydraulic engineers about its utilisation. One of the expedients he proposed was the introduction of Fourneyron's turbine. There is less confidence now about the advantages to be derived from the Irish streams, rivers, and lakes. Dr. Sullivan admits that water-power is often more expensive than steam-power:—

> In discussions on Irish industrial resources too much stress is, I think, laid upon our abundant water-power, without taking into account its cost, which, of course, involves not merely the price of horse-power as against steam-power, but also the expense involved in having to go to the site of the power, whereas in the case of steam-power it can be produced wherever there is a favourable conjunction of all the other conveniences.

Whether the water can be utilised in connection with electricity is a question of the future. Dr. Sullivan believes in the affirmative, but it will not be wise to defer exertion until that time arrives.

Dr. Sullivan is forced to admit that Ireland is on the whole very poor in fuel. The bogs, which occupy nearly three million acres, or one-seventh of the entire area of the island, are no more likely to produce a fuel that can be utilised on a large scale than a material for "wax candles," which was Jasper Rogers's pet product. Dr. Sullivan suggests that the turf or peat might be converted into combustible gases in a Siemens' furnace, and that seems a more rational mode of utilisation than into gunpowder or tar. He speaks of draining the great bogs, but in all such proposals cost is omitted. On one of the Irish railways which runs through bog, the contractor put down 2,000*l.* a mile for the cost of making drains that would be sufficient to keep a narrow strip sufficiently dry to carry the rails. He found that the work ran out to over three times that sum.

The coal-fields of Ireland are not extensive, and in the north Scotch coal is sold at a cheaper rate almost at the pit's mouth. According to the last return the Irish output was 126,114 tons, of the value of 57,258*l.*, which is over 9*s.* a ton on the average. It is calculated that "the whole of the estimated available coal in Ireland would not supply fourteen months' supply for Great Britain." But Ireland has no necessity to depend on native supplies for the fuel required in industrial works. In towns on the eastern and southern coasts English coal can be obtained as cheaply as in London.

It is time, however, for us to turn to the materials that are connected with building. The greater part of the country consists of limestone beds, much of which can be utilised for building stone. The calp is not always an agreeable colour, and after a few days of rain a village of limestone houses presents a dreary aspect. There are few places in which stone is not available, and hence we can

* *Report on the Cork Exhibition.* By W. K. Sullivan, Ph.D., F.C.S., &c., President of Queen's College. Cork: Purcell & Co.

understand proposals to build labourers' cottages at prices ranging from 55*l.* to 80*l.* a-piece. Building materials of an expensive class are rarely required except in the larger towns, for, according to the instructions to the Government valuators, "houses of one storey in height are more valuable, that is, they let at a higher rate in proportion to their cubical contents, than houses of two storeys, and houses of more than two storeys diminish in value, as ascertained by their cubical contents, in proportion to their height." Even in its houses Ireland is the country for anomalies.

There is a good deal of variety in the ornamental stones; fine slabs of marble in many colours are to be obtained, but there seems to be no way of ascertaining how much is produced and exported. Professor Sullivan gives the following account of the building stones, but his hesitation about the qualities of several among them suggests how little is known on the subject :—

The carboniferous limestone which forms so prominent a feature in the geological structure of Ireland is in many places sufficiently hard and close-grained to constitute various kinds of marble. In Galway a beautiful green altered limestone or serpentine occurs, which has been to some extent worked. Granite occurs in several parts of Ireland, but especially in four principal districts. The Dublin and Wicklow mountains consist mainly of granite; the mountains about Newry and the south of the county of Down; the south-west of Galway and the county of Donegal. The Dublin and Wicklow granite has not much variety, and though a beautiful building-stone is not in general well adapted for polishing. But the syenite of Croghan Kinsella, on the borders of Wicklow and Wexford, would probably prove, especially in depth, a highly ornamental stone. There is a great variety of granites about Newry and in the county of Down; some varieties take a high polish. The pegmatite of Sliabh Donan ought to make a very fine building-stone. The Donegal and Connemara granites are not as well known, but there is a red granite at the Gap of Barnesmore which if worked might prove a good ornamental stone. The cost of carriage would, however, be a great disadvantage. There is a fine porphyry in sandstones of the North of Ireland. Good sandstones are found in other parts of the country also, as, for instance, at Rosenalis, in Queen's County, and at Cape Clear and other parts along the coast of the county of Cork. There are also numerous indurated grits adapted for making paving setts, but many of these stones could not be worked at a price to compete with Welsh stone, owing to position and cost of carriage.

Dr. Sullivan seems to think that the Welsh paving-stones gain more than their right share of success, and there seems to be a prejudice against Irish setts. In a competition with quarry-owners, who possess the best machinery for squaring stones that can be obtained, the Irish contractors are handicapped. But it is plain from the correspondence relating to the paving contract in Dublin that the Irish corporations must have more than one reason for declining native stone. Should Berkeley's suggestion of a brazen wall around Ireland to prevent foreign importations be realised, the Irish builders and contractors would be among the first to denounce it.

The Welsh slates are also beating the Irish. According to the census of 1881 there were only 103 men in Ireland engaged in slate-quarrying, which number can hardly comprise all the people engaged. The Inspector of Mines estimated the product of the Irish slates quarried in 1883 at 10,000 tons, the value being 20,000*l.* But if we take the estimate in Sir Robert Kane's book, that quantity of slates was produced in the Killaloe quarries alone about 1844. On this subject Dr. Sullivan writes :—

Irish slates have to contend with many difficulties, of which I need only mention three :—(1) Competition with Welsh slates from extensive quarries which have been worked to a great depth, and where, consequently, the rock has not suffered from water or air, and where the best appliances and the highest trained skill are employed; (2) the Welsh slates have had possession of the market so long that a prejudice exists among builders and the public against the use of any other; (3) the produce of a new slate quarry is necessarily at its worst, for the rock near the surface is more or less acted upon by water and changes of temperature, has more incipient joints, and is not so evenly fissile or well-coloured as the rock which is reached when the quarry is worked for a considerable time. In 1883 about ten slate quarries were in operation, or at least had not been given up.

Dr. Sullivan, in his former essays on Irish resources, refers only to the cement that was found at Lough Ree. But the late Henry Reed, who was the first authority in Great Britain on the subject, assured the writer that he was making a cement in more than one place in Ireland which would be found to be superior to any imported from Germany. Some specimens appear to have been exhibited in Cork, and, according to Dr. Sullivan, sustained very high tests of strength.

A new industry such as cement-making has, however, little chance of gaining a footing in the English, or indeed in any, market so long as the Irish railway and other carriers charge the rates for transit which now prevail. It would seem sometimes as if the managers considered they were under an obligation to impede traffic. We have heard commercial travellers complain of the attempts that are made on Irish lines to treat their samples as ordinary personal luggage. The statistics given by Dr. Sullivan are extraordinary. If lamps are sent from Birmingham to Limerick, *viâ* Dublin, the through rate will be 76*s.* 8*d.* But if the Irish managers can have a hand in the bill the cost will amount to 110*s.* Some goods sent from Bradford in Yorkshire to Tralee cost 77*s.* 6*d.* per ton : the charge for them between Cork and Tralee is 58*s.* One other case may be cited :—

In Cork a kind of concrete or artificial stone called "ferrumite" is made, which is very well adapted for flagging pathways, dressed quoins, and many other purposes. The slabs should obviously be put in the same class as the flags for which they are intended as a substitute, namely, class 1. They are, however, put in class 2, and consequently cost twice as much to convey them by rail. In a relatively cheap material of this kind a higher rate of carriage is very often sufficient to turn the scale against a trade.

But the railway companies are not satisfied with their efforts to kill the home trade by excessive charges. There is also excessive delay in transit, a defect with which the general indifference to time well accords. In fact, the foreign competitors find a most serviceable auxiliary in the manner of conducting railways and steamers. The evils have become so aggravated that many of the wisest men in Ireland believe that trade cannot have fair-play until all the railways are acquired by the State and worked by Government officers.

This penny-wise policy which inspires railway directors is not confined to them. The manufacturers of silks, poplins, and tabinets had also faith in it. For a time it certainly succeeded, and some of them contrived to make fortunes, but finally the trade was ruined. It might be supposed that every tradesman would know that the success of textiles must now generally depend on the novelty no less than on the beauty of the patterns, but the producers of poplin would not on any account expend money on designs. Cotton-spinners and makers of cheap goods might need an outlay of that kind, but poplin, having an old reputation, was above art. So thought the makers, until it was found that stuff could be produced resembling poplin for one-tenth the price, and with infinitely finer patterns. The Irish material at once lost its position. The manufacturers deserved no commiseration, for their ruin was caused by stinginess; but the unfortunate weavers in the garrets of the Liberty were made to suffer, and the representatives of one of the few remaining artistic industries of Dublin were driven to the workhouse. In order that we may not be supposed to exaggerate the mismanagement in this case we shall let Dr. Sullivan give his experience :—

I have seen crimson and black velvet made in Dublin which could not be surpassed by the looms of Genoa. The decay of the manufacture is, I believe, mainly due to the employers, who, from want of foresight, indolence, or carelessness let their business get into a crystallised state, which no change in fashion, no competition of new fabrics, no improvements in processes or mechanics, could influence. The patterns brought from France in the reign of Louis XV. continued to furnish models for new designs—nay, were repeated without change. In at least one instance I remember to have found a favourite pattern in Dublin in a French stuff at least as old as the Regency!

The refusal to recognise the old principle, "live and let live," of which the poplin trade is an illustration, is likewise seen in many other industries. In that case the crisis occurred at a time when a demand was arising in England and America for rich furniture stuffs. Wisely directed, the poplin trade might have been vastly extended, and in all

probability it would now be in a state of prosperity surpassing that of the eighteenth century. "It takes a long time and much labour to create a market," says Dr. SULLIVAN, "which may be lost in a few years by negligence or unfair trading:" the words deserve to be inscribed on every manufactory in Ireland.

The poplin trade is not the only one which has suffered through indifference to design. Another instance, although much less important, is seen in bog-oak carving. Many people consider it is incumbent on them to patronise ornamental woodwork, and neither in Tunbridge Wells nor in any visitors' haunt in England or Scotland is anything to be found to match for cost the knick-knackery in black oak and arbutus which is supposed to be produced in Killarney. For a time people were willing to pay high prices, but the round towers, crosses, dogs, and snakes became monotonous, for there was as little difference between the figures as between Shoreditch brackets. The trade is going. "The real cause of the comparative insignificance of the carved and ornamental woodwork industry," says Dr. SULLIVAN, "is the wretched taste that pervades the whole of the products. I cannot see the faintest sign of improvement in this respect for the last twenty years, yet it is by artistic taste alone that such an industry could be made to prosper. The ornaments in Connemara serpentine are, if possible, in worse taste." The want of patronage must have a most depressing tendency on the Irish art schools, for we suppose the only place where anyone could speak of a commission to a student would be in Belfast. We are not surprised, therefore, that when the Exhibition Committee offered a prize for a design for the cover of their catalogue to the Cork students, the drawings submitted "were wretched, and by their poverty of invention, and the use of the usual conventional symbols in perfectly meaningless ways, it was forcibly proved how little they understood of the uses of art." A Belfast designer had to be called in, which ought to be humiliating to the city which produced MACLISE, FORD, and MAHONY. If the cover of the report be his work, he is dexterous with Celtic ornament.

The report of Dr. SULLIVAN will not, we suppose, be much admired in Ireland, for it contains too many stern, incontrovertible truths, and there are no passionate appeals for new Acts of Parliament to serve as substitutes for honest exertion. The country would be better if there were more teachers of his class, who would have the courage to say that if Irishmen wish to remove the evils which paralyse their industry, they must use their brains as well as their arms. The Cork Exhibition Committee could not expend their surplus more wisely than by circulating the report throughout the country, omitting, however, all the names of the nobodies who are introduced in the volume.

HENRI REGNAULT.*

HENRI REGNAULT, the French painter, was born on October 30, 1843, and his brain was pierced by a Prussian ball at Buzenval, on January 19, 1871. Few men have insured so vast an amount of fame from twenty-seven years of life. The Government organised an exhibition of his works after his death, and for the catalogue THEOPHILE GAUTIER wrote a preface in his best style. Paintings by REGNAULT are in the Louvre, the Luxembourg, and other museums. Several biographies of him have appeared; there are reproductions of his works in many forms, and a friend has, with reverential care, collected and annotated his letters. We see a statue of him among the great men of Paris in one of the niches of the Hôtel de Ville. For his monument no less a place than the Ecole des Beaux-Arts was selected; an architect and a sculptor gladly combined to produce the design, and one of the greatest sculptors in France was proud to add a supplemental figure, which was suggestive of the affection with which the memory of the painter was attended. And now we have his memoir in the series of "Artistes Célèbres" following one on PHIDIAS.

So much interest may be partly ascribed to the manner in which REGNAULT'S life was prematurely closed, and partly to the lovableness of his nature. But there can be no doubt that France lost a great artist in him. Above all the men of his generation he seemed best qualified to be recognised as the successor of DELACROIX. We can see from his works that REGNAULT was possessed of some of the sacred fire which inflamed DELACROIX; he had a like esteem for every appearance of power in man or animals, and was no less fascinated by scenes of terror. But while the elder artist was in an unhealthy condition throughout his life, and painted force because he vainly aspired to its possession, REGNAULT was full of vigour, and seems to portray himself in some of his strongest figures. It was characteristic of him that in almost the last lines he wrote while serving as a common soldier—for he would accept of no promotion—he expressed the conviction that what France wanted was stronger men, and that henceforth there should be no dallying with pleasure. He had in his life acted as if he were always inspired in that way. He never forgot the necessity of physical exercise, and his studio resembled a gymnasium. If REGNAULT were possessed of a magic gift it would have been used to give him greater skill in horsemanship, in flying from trapèze to trapèze, and in painting masterpieces. The three forms of exercise seemed to be necessary to his existence. One of the consequences of his muscular power was his capability to use both hands in painting, and, like all robust men, he took pleasure in dogs and horses.

REGNAULT came of a good stock. His father was distinguished as a chemist, a professor, and a member of the Institut. He was considered to be the worthiest to succeed EBELMEN in the direction of the works at Sèvres, and he held the office for about twenty years. But he could not understand his son, and apparently the last man to whom HENRI REGNAULT would submit one of his works was his father. It was not surprising that, when the bent of young REGNAULT'S disposition was made very plain, his father should seek to place him under artists whose style might be called scientific from its coldness. His genius could not, however, be chilled, and in the sketch for an *Entombment*, which he produced in 1864, we can see a revelation of future power. In the Ecole des Beaux-Arts he was better understood by his fellow-students than by the professors or judges. He tried for the Prix de Rome more than once, and had concluded that he must dispense with a residence in the Villa Medici. But happening to see the impassioned look of a young musician, he did his best to represent it in a figure of a goddess, and the hurried work so captivated the judges that they awarded him the Prix.

REGNAULT remained in Rome from 1867 to 1871. Like many artists before him, he was at first disappointed with what he saw. He had known the buildings, statues, and paintings by repute, and they seemed far less grand than the visions he had framed. REGNAULT was not a follower of any master, and he could not take anything as sublime at another man's dictation. The people of Rome had more attraction for him than the antiques or the great masters, and he preferred the ordinary folks of the city to the models. REGNAULT was a musician, and it is to be feared that the performances of the papal choir had something to do with the humble estimate he formed of the standard attractions of Rome. However, it was not long before he felt overcome by awe when he tried to copy a part of the Sistine ceiling, and he recognised that RAPHAEL could do better work than his *Madonnas*.

The woodcuts in M. WAY'S book on Rome (a translation was published in London) show us how closely REGNAULT studied the Roman people. Work of the kind was before his time supposed to be beneath the notice of a holder of the Prix. Painters are not always efficient illustrators of books, but REGNAULT'S sketches are more effective than DE NEUVILLE'S in the same volume. His skill in characterisation is evident. The figures are never posed, but seem to have been transferred to paper when most animated; and whether he draws cardinals' servants in their stiff liveries, peasants in the excitement of a game of mora, bookworms chaffering for volumes at a stall, savage clephts, or toil-worn scholars, his hand and eye are true to the spirit of the place. Many of the men who assisted in the work have since succeeded as painters, but their illustrations were far behind REGNAULT'S.

One of the woodcuts represents the semi-barbaric race

* *Les Artistes Célèbres: Henri Regnault.* Par Roger Marx. Paris: J. Rouam. London: Gilbert Wood & Co.

between horses that seem never to have undergone a training, and the scene probably suggested the picture of *Automedon with the Horses of Achilles*, which he sent from Rome to Paris. But it was received with little favour in the Academy, where ambitious works are considered unbecoming a prize-holder. Soon afterwards REGNAULT met with an accident while playing the part of the Greek horse-tamer, and to regain strength he took a voyage to Spain.

The influence exercised by Spain since WILKIE discovered the country has been most remarkable. REGNAULT was at an impressionable age; he had his friend M. CLAIRIN with him, and he was free from academic supervision. It is not surprising if he said many things which in the Villa Medici would be taken for heresy. Some of the carving in Burgos Cathedral he considered worthy of MICHEL ANGELO. The Spanish masters were, he maintained, more useful to the student than either MICHEL ANGELO or RAPHAEL, for, in their friendliness and good-nature one was allowed more intimacy than was possible with demigods. While he was in Madrid one of the little revolutions of Spain burst forth, and PRIM became the idol of the hour. It was a new experience for the artists, and they were carried away like the natives with worship of the dictator. The large equestrian portrait of PRIM which is in the Louvre was produced at this time, and as an expression of temporary idolatry it will hereafter be classed with DAVID's *Napoleon Crossing the Alps*. People may then find it difficult to discover why PRIM should be made the subject of one of the noblest equestrian pictures that painting has given us. DAVID made an impossible horse in an impossible position; but REGNAULT, instead of representing PRIM's charger as if he were performing in a circus, makes him appear standing with the legs stretched and rigid, as if to give a wider base to the controlling power he sustained. The dictator, who was a lover of pipe-clay and pomatum, could not understand himself as a god of war, and objected to the picture because his hair was not shown neatly parted. Poor REGNAULT begged of him to forget it as if it were a bad dream.

It was necessary for him to return to Rome in order that the terms of the scholarship might be complied with. REGNAULT left Spain with unfeigned regret, for he felt his powers expanding in that country. Rome, he thought, was used up. He was also filled with admiration for FORTUNY, who then had a studio in Rome, and thought that if he dwelt longer in Spain he might become like the young master. REGNAULT's eyes were opened to the advantages which a picture derives from rich stuffs and "properties," and what official regulations demanded from him was a picture which would demonstrate his power in painting from a nude model. In a state of disaffection he commenced his *Judith and Holofernes*, a picture which would pass if the figure of the naked warrior could be cut away. There are two parts in the picture—one is REGNAULT's, the other belongs to the Academy, and might have been painted in a fit of bad temper against official requirements.

When the moment arrived, REGNAULT fled from what he called the fetid sky and the Italians of the Opéra Comique. He took the shortest course to Spain, and once there, he and a few of his friends led a gipsy life, and made their way in that fashion to Granada. The Alhambra entranced him. It appeared to be a treasure-house, and he copied it in detail, laying up materials for future pictures. He had no thought of making pictures; it was enough occupation to master the place. His father had asked for information about the tiles and other pottery, and this gave occasion for study that might be called profound. After a time he wished to know more about the Moors, and he made the journey to Tangier, and there he fixed his quarters, not like an excursionist, but as a veritable native. The *patio*, or court, was covered with glass, and converted into a studio, from which everything European in the form of furniture was eschewed. There he painted several of his pictures, and especially the *Salome*, which was a new interpretation of the character. It was not as a languishing young lady REGNAULT painted the dancer. He represented her with thick black hair, partly nude, and smiling. The type is not European, and there is no suggestion of gratified revenge. To this *Salome* the execution of the Baptist could be no more than a trifling incident, and her smile imparts terror to the scene. The novelty of the figure and the originality of the scheme of colour puzzled the critics. The picture was supposed to be demolished when it was described as a chemical experiment, and even yet it continues to excite controversy.

In his *Moorish Executioner* there is the same downright way of painting disagreeable things. When the picture was seen at South Kensington people turned away from it scared by the blood which runs over the steps, the contorted trunk, and the head which seems to utter curses. Summary justice can never make a pleasing picture, and it was forgotten that in the delightful Alhambra scenes of the kind were not uncommon. His *Sortie du Pacha* made less strain on the emotions. It should not be forgotten that these pictures were produced while REGNAULT was attached to the French School at Rome, and, strictly speaking, they were, therefore, no more than works of a pupil.

After visiting France REGNAULT returned to Tangier, travelling through Spain to reach it. He wished to paint a colossal work, representing a Moorish general laying the fruits of his victory at the feet of his sovereign. The subject was realised by his friend, M. CLAIRIN, in the picture exhibited last year in the Salon, and which was purchased by the State. REGNAULT erected a new studio in Tangier, and was about to settle down to his great task when the war broke out between France and Germany. He was too good a Frenchman to stay in Africa when his arm could be of use. Accompanied by M. CLAIRIN, he came without delay to Paris, and, with some of his fellow pensioners from the Villa Medici, he joined the 69th battalion. He took his full share of the suffering which was entailed during that winter on the men who were defending Paris against the enemy. His death was caused by his patriotic enthusiasm. A retreat had been sounded at Buzenval, but as some cartridges remained with him, he returned alone to discharge them against the enemy, who were concealed behind the wall. He declined to return while one was left, and met a hero's death.

The painter's art is so difficult to acquire that any defects which can be found in REGNAULT's works are excusable on the score of youth. It must also be remembered that he was a long time feeling his way under direction which he could not respect. He was unable to recognise his own power until he visited Spain, and the work he then produced must ever excite astonishment.

Everyone who can appreciate bravery and art will take an interest in the life of REGNAULT. M. MARX, with fine insight, recognises both sides of the painter's character, and has given a biography which forms one of the worthiest tributes offered to the memory of REGNAULT.

TESSERÆ.

Michel Angelo's Architectural Drawings.

WILLIAM BURGES.

THE British Museum is not very rich in the architectural drawings of this master, yet it will probably be better to go through them, as they are more accessible to the student than those in other collections would be. They are for the most part sketched in with common ink (which has now turned brown) with a common pen, and drawn right off by hand, the circles being put in anyhow. Some of them probably have been first of all scratched in with charcoal, but we have no traces of it; one of them, however, has evidently been inked in upon something resembling chalk, or very black soft pencil. The drawings, even the details, are exceedingly rough, and if ever worked from must have been drawn out on a board by a pupil, and afterwards corrected by the master. They consist of all sorts of subjects—windows, capitals, entablatures, &c.—but none of any great interest. The Musée Wicar, at Lille, is the place one must go to who wishes to see what the architectural drawings of Michel Angelo are really like. It appears that Wicar got hold of a sketch-book of Michel Angelo's very similar, in fact, to that of Villars de Honnecourt, and it is this book, cut up, and glazed and framed, which constitutes one of the riches of the Lille Museum. The book contains architectural studies of the contemporary edifices—of those of Bramante and Brunelleschi; studies from Classic buildings, and his own compositions, including the façade of St. Laurence, and the plan of the vestibule of the Laurentian Library; and lastly, directions for casting artillery. It is curious to compare this latter with the Trébuchet of Villars, so excellently described and elucidated by Professor Willis. I find the following notes in my copy of the Wicar collection:—"These drawings are executed in brown ink, with the help of a common straight-edge; there are no cross-

hatchings, and where the plans are tinted they are done so in a very careless manner. Very often no straight-edge is used, and the lines are drawn in by hand; lines are often drawn with a blunt point on the paper."

Early English Doorways.

F. A. Paley.

An Early English doorway is often a wonderful piece of art, however little it may attract the attention of ordinary observers. It is most pleasing to notice the long trails of dog-teeth lurking in the dark furrow of a label or channelled recess; to see the end of some inconvenient member got rid of by throwing a flower across the point where it suddenly stops or dies into the wall; to admire the efflorescent boss and the foliaged capital intruding their luxuriance upon the mouldings and hollows, as if they had overgrown their original and proper limits. How beautifully, too, the knots of pierced and hanging leaves extend like some petrified garland or bower of filigree work round the arch, dividing the plainer mouldings into groups, and almost imparting life to the very stones. There are abundance of doorways of this style which exhibit the most delightful varieties in their forms and groupings; always, yet never the same. Some examples occur at Bolton and Furness Abbeys, whose arch-mouldings extend five or six feet in width. The west fronts of several of our cathedrals have Early English doorways of amazing magnificence. Alas, that we should now try to borrow an unreal splendour by "running" archways by the yard in vile terra-cotta or viler patent cement! And strange that, with such noble examples of rich perspective effect and artistic display before them, our architects will generally persist in inventing mouldings for themselves rather than copy any of the perfect works of ancient art which are everywhere to be met with, and of all degrees of costliness. The wretchedness of modern mouldings can only be appreciated by those who take the pains to compare them with the ancient.

Pompeii.

J. G. Bruce.

Pompeii has been an ill-built city. The walls of the houses are like those of London. The masonry of our Roman wall is much superior to most of that at Pompeii. The buildings consist of tiles, lava, volcanic tufa, and organic tufa, or what we would call petrified moss. It is astonishing how largely this organic tufa, which we are familiar with in the Roman buildings in the north of England, enters into the composition of its buildings. The walls of the city have been originally made of pieces of lava not much larger than a good-sized fist. It has, however, been repaired at two subsequent periods with large-sized and well-squared blocks of organic tufa and travertine. The fountains in Pompeii are numerous, each being provided with a cistern, something like that at the north gate of Borcovicus. I measured the ruts in the streets. From the centre of the one to the centre of the other is 4 feet 7 inches. I measured one street, which was 7 feet 3 inches wide, and another, which was 6 feet 4 inches. We must not be surprised that the streets in our English stations are so narrow.

John Nash and Regent Street.

James Elmes.

Regent Street and Regent's Park will carry the names of George IV. and John Nash, as patron and architect, with considerable applause to a late posterity. The clearing away of the narrow dirty streets, alleys, and filthy courts without sewers or underground watercourses—a very honeycomb of cesspools and hive of solid abominations—that existed between Oxford Street and Pall Mall, to make way for a broad, handsome, and varied thoroughfare from the New Road, Marylebone, through the handsome *cul de sac*, Portland Place, to St. James's Park, is not only a work of great sanitary welfare to that portion of the metropolis, and has opened a necessary thoroughfare from Westminster to the wealthy district of Marylebone, but is one of the greatest architectural improvements that have taken place in the metropolis between the reigns of Charles II. and George IV. The expense of purchasing the ground and property and interests upon it was enormous, but the calculations of the architect, and the powerful support he received from his royal patron, enabled him to accomplish, after many and varied obstructions, this vast undertaking. When the plan for this street was completed, the ground was offered to public bodies or individuals under severe restrictions as to external design and quality of materials, at heavier ground rents than had ever before been paid for houses of retail business. Sites for public and private buildings were taken, as the speculators or builders required; and as fast as portions of the main street were finished, and became connected with lateral streets, they were opened to the public. Nash did not compel any of the lessees to employ him as their architect, but left every one to make his own choice, reserving to himself and the commissioners for carrying the works into execution a right of rejecting such plans as did not accord with the intended style of the street. From this cause arises the pleasant variety that distinguishes Regent Street from the monotony of many of its more opulent northern neighbours. Instead of single houses it consists of many fine rows of houses, some of which would not disgrace a palace or royal residence, and might be taken for such did not the subdivisions of the shops or offices show their application. Many of them, Waterloo Place, the Quadrant that leads from it to Regent Street, the mansion that he built for himself on its eastern side, and some of the best connected series of houses, and the two circuses that connect the great crossings of Piccadilly and Oxford Street by a continuation of the main street to Langham Place, are from the designs of Nash. Some of these, to hasten the completion of the work, he undertook himself as a building speculator, which neither amended his fortune nor increased his comforts; but Nash was a bold, enterprising man, and had a spirit not easily daunted by difficulties. The other architects who principally contributed to this great undertaking were Soane, C. R. Cockerell, the younger Repton, Decimus Burton, the two Smirkes, and the elder Abraham.

Marble.

G. Wilkinson.

The physical or external character of marbles constitutes the chief consideration with reference to their use for decoration or ornamental architecture, their colour and internal structure being the most important. Their chemical character has reference more to the facility with which they may be converted into use, and their capability of receiving and retaining a certain polish. In their simplest and purest state, marbles chiefly consist of carbonate of lime, which is of a white colour; the whitest kind, however, is frequently associated with quartz or silex, which more or less deteriorates it. This is more or less united both chemically and mechanically in various ways with nearly all the marbles. The variations in colour arise chiefly from accidental causes, in the greater or less admixture of carbon, or the stains of various metallic oxides, or the sectional outlines of embedded fossils. Magnesia enters largely into the serpentine variety of marble. The more crystalline and least earthy marbles are the least durable, the compact or finely granular crystalline marbles being superior to those which are largely crystalline or of a slaty texture. Almost all the varieties burn into quicklime; several of them, however, exfoliate in the conversion before they become caustic, and fall into sand when exposed to the ordinary mode of separating the carbonic acid; such qualities are, therefore, very inferior for ordinary cement, as they make a costly and meagre mortar.

Arabesque Decoration.

A. Poynter.

It is remarkable that the only mention Vitruvius makes of this style of decoration is in reprobation of it; but he describes it so accurately that the passage is worth repeating, if for no other reason. After pointing out and classifying what he considers legitimate objects for painting walls, such as architectural compositions, landscapes, gardens, and sea-pieces, the figures of the gods, and subjects drawn from mythology, and the poems of Homer, he proceeds thus:—"I know not by what caprice it is that the rules of the ancients (observe that Vitruvius looks up to the ancients in his day, that is to say, to the Greeks), who took truth for the model of their paintings, are no longer followed. Nothing is now painted upon walls but monsters, instead of true and natural objects. Instead of columns we have slender reeds, which support a complication of flimsy stems and leaves twisted into volutes. Temples are supported on candelabra, whence rises, as from a root, foliage on which figures are seated. In another place we have demi-figures issuing from flowers, some with human faces, others with the heads of beasts, all things which are not, never have been, nor ever can be. For my own part, I hold that painting is to be esteemed only so far as it represents the truth. It is not sufficient that objects be well painted—it is also necessary that the design be consonant to reason and in no respect offensive to good sense." Pliny also laments that, in his time, gaudy colouring and quaint forms were held in greater estimation than the real beauties of art. But with all deference be it spoken, there is another side to the question, which these great authorities seem to have overlooked. Conventional decorations of this kind were within the reach of thousands to whom paintings in the higher branches of art were inaccessible, and a more general diffusion of taste must have been at once the cause and effect of their universal adoption—how universal, the remains of Pompeii reveal to us. If we examine the ancient arabesques independently of these prejudices, we shall find endless beauty, variety and originality; graceful details combined in consistent and ingenious motives and analogies, and great skill and freedom in the mode of execution. We shall also find reason to doubt whether the introduction of the arabesque style really had the effect of discouraging painting of a higher class, since even at Pompeii poetical compositions of great merit are frequently combined with the lighter ground work of the general decoration. However fanciful and capricious the arabesque style may at first sight appear to be, there can be no doubt that it may be treated

according to the general fixed principles of art, and that the artist will be more or less successful as he keeps these principles in view. A due balance of the composition is essential, so that the heavier parts may sustain the lighter through every gradation, and there must be such a disposition as not to cover too much or too little of the ground. Unity of design is to be studied in a connection of the parts with each other, and in the harmony of the details and accessories, which ought as much as possible to tend to some general aim. It would lead us much too far to enter upon the subject of colour; but it may just be observed that in the ancient decorative painting the balance of colour is strictly attended to. Their walls usually exhibit a gradation of dark panels in the lower part—a breadth of the most brilliant colours in the middle and principal division, and a light ground thinly spread with decoration in the upper part and in the ceiling—an arrangement dictated by the natural effects of light and shade and reflection. As lightness and grace are the peculiar attributes of arabesque, the foliage which forms its most fertile resource should never be overloaded; its details and modes of ramification ought to be drawn from nature.

Swanscombe Church, near Gravesend.

J. G. WALLER.

It is built of an heterogenous mixture of materials, chalk, rag, masses of stone of various kinds, and an admixture of Roman tile. The tower shows some attempt at a regular plan in the disposition of its material; it is for the most part constructed of small stones, laid in courses of three and four alternately with one of flint: this disposition is by no means regularly observed, sometimes there are two courses of flints, and sometimes but two of stone. There is something in the above arrangement like an imitation of the Roman flint being used in the place of tile. The quoining presents some curious features, and has evidently been controlled by the nature of the material at hand; it exhibits a strange variety of stones, some disposed in long and short masses, some alternately with Roman tiles, and the latter are found worked into the rubble, here and there, without any order. It may also be well to observe that a large circular window of Roman tile, on the south side, is now blocked up. The chancel is chiefly flint-work, set in herring-bone, and covered with durable rough-cast. The south side, where much of this is removed, shows very evident indications of the walls having been formed by planking the sides until the mortar or concrete had firmly set. The marks of the planks are still very visible. This part of the church has undergone many alterations: an addition to the east end is easily to be distinguished, from its patched appearance; lancet lights of the twelfth century have superseded windows of a much earlier date, traces of which still remain; and a doorway on the north side appears to have been blocked up at the same time as the addition was made to the east end, but its architectural features are quite destroyed. Herring-bone work, according to Mr. Bloxam, is not of itself a criterion of date; but the flint-work in this fashion I have above noticed appears to me, from its being always connected with other facts, to be one of the indications of Anglo-Saxon work.

"Saltpetreing" in Stone.

G. R. BURNELL.

The actions capable of affecting the stability of the composition of ordinary building stones, by reason of the new forms of matter they superinduce, may principally be considered to be those resulting from the absorption of the gases of the atmosphere, and especially the extraordinary process known by the name of "saltpetreing," or more correctly speaking, of nitrification. This process displays itself in the formation of minute crystals, efflorescing from the interior to the exterior of the stone, and it leads to the destruction of the exposed surfaces of the latter, through the gradual removal of the minute particles, in consequence of the disintegration produced by an expansive action of the crystals in process of formation. It is supposed that the organic matter diffused through nearly all stratified deposits gives rise to the formation of certain nitrates (such as the nitrate of lime or the nitrate of soda) under the influence of damp and of air, and of light of certain descriptions — for nitrification certainly takes place most abundantly near damp ground, rising in a wall *pari passu* with the range of the capillary attractions of its materials, and upon the northern or shaded faces of the said walls. Not only does this nitrification throw off the minuter and less adherent particles of the building materials themselves, whether they be stone or brick, but it is also able to detach any protecting coat which may be put upon them, if the adhesion of that coat to the subjacent material should not be of a very energetic nature. Let the adhesion however be ever so energetic, if once the action of nitrification should have been established it must run its course, and the amount of evil it is capable of producing will simply depend upon the quantity of organic matter originally contained in the materials or susceptible of being absorbed by them from the atmosphere. The secondary limestones which have not been affected by plutonic action, the loamy clays, some kinds of pit sand, sea sand, and some descriptions of natural cements, are particularly exposed to the danger of nitrification in damp positions; and whenever it is once established it is in vain to expect to be able to preserve any mural paintings, or even any sculpture of a delicate character. It is also to be remarked that nitrification will frequently take place in the most dangerous manner precisely in those materials whose exposed surfaces are covered with coatings impervious to the air; and that in houses or buildings of that character it is most energetic on the interior faces of the walls, or precisely on those which are the least exposed to the atmosphere. In fact, it is mainly in consequence of the absorption of moisture by the building materials, and of the chemical changes thus produced in the organic matter those materials may contain, that the peculiar form of decay which accompanies "saltpetreing" arises.

Cast-Iron Girders.

COMMISSIONERS ON IRON.

The use of simple cast-iron girders for bridges appears to be limited only by the power to make sound castings (which arises chiefly from the difficulty of pouring the metal equally and the inconvenience of handling large masses). Mr. Rastrick, however, would not put any limit to the length. Mr. Hawkshaw considers that they may safely be made more than 50 feet long; in which opinion Mr. Fox and Mr. Grissell concur, but name 60 feet as the limit. Mr. Glynn, Mr. Charles May, and Mr. Joseph Cubitt would make them from 40 to 50 feet. Mr. P. W. Barlow, Mr. Fairbairn, Mr. W. H. Barlow, and Mr. Stephenson state 40 feet as the limit; and Mr. Brunel names 35 feet, as he does not consider that sound castings can be insured to a greater length. Mr. Fairbairn, however, mentions a girder in Holland 70 feet long cast in one piece. It appears to be universally admitted that the form resulting from Mr. Hodgkinson's experiments on the tension and compression of iron is that which gives the greatest strength; but the actual proportions are generally modified to suit the varying circumstances under which girders are employed. Mr. Stephenson sometimes makes the top flange equal to the bottom one, but usually in the proportion of 3 : 5, partly to obviate any risk from unequal cooling of the materials, and partly from the necessity of having a large top flange to bolt the flooring to. In preference to using a single girder, Mr. Stephenson recommends two girders to be bolted together, with a baulk of timber between, to which the rail is fixed. Mr. Hawkshaw, Mr. Fox, and Mr. Joseph Cubitt recommend that the top flange be increased beyond the proportions given by Mr. Hodgkinson, in order to resist the lateral torsion. Mr. W. H. Barlow and Mr. Locke would use the arched form of girder whenever practicable, and the former gentleman says that straight girders have been in fashion, and consequently more used than practice actually required. Mr. Fox, in girders subject to dead weight only, would make the proportion of the top flange to the bottom one as 1 : 6, but in railway bridges he recommends 1 : 4. Mr. Thomas Cubitt mentions that shoes, or sockets, or any projections cast on girders, have a tendency to create flaws from causing the dirt to accumulate in those places, and he considers that the shape which will insure a sound casting should be as much considered as the theoretical form of greatest strength.

THE ROYAL ARCHÆOLOGICAL INSTITUTE.

THE annual congress of the Royal Archæological Institute will be held at Chester, under the presidency of the Duke of Westminster, beginning on Tuesday, August 10, and concluding on the following Tuesday. The proceedings will commence with a reception of the Institute by the Mayor and Corporation of Chester at an inaugural meeting at the town hall, when the President will deliver his address. This will be followed by an inspection of the city, and in the evening Dr. E. A. Freeman will open the historical section. Among the places to be visited during the week are Llangollen, Valle Crucis Abbey, the Pillar of Eliseg, Offa's Dyke, Chirk Castle, Wrexham Church, Eaton Malpas Church, Nantwich, Acton, Bunbury, Beeston Castle, Tarvin Church, Kelsbarrow, the junction of Roman roads at Nettleford, Eddisbury Hill, Lob Sack, Cuddington, Hawarden Castle, Ewloe Castle, Mold Church, Bailey Hill, Caergwrle Castle, Gresford Church, Flint, Conway, and Carnarvon. On Thursday morning, August 12, the annual meeting of the members of the Institute will be held, and in the evening of that day there will be a conversazione at the town hall. The Bishop of Chester will be the president of the antiquarian section, and the architectural section will be presided over by Mr. Beresford-Hope. The vice-presidents of the meeting will include Sir Theodore Martin, Sir James A. Picton, the Rev. Sir Talbot Baker, Sir Robert Cunliffe, Sir Richard Brooke, Sir Philip Egerton, Sir T. G. Frost, Sir Philip Mainwaring, Sir Llewelyn Turner, Sir Watkin Wynn, the Rev. Canon Tarver, the Rev. Canon Eaton, and Mr. Herbert Gladstone.

NOTES AND COMMENTS.

AMONG the artists recommended for the Prussian gold medal, in addition to Mr. OULESS and Mr. HERKOMER, are the two architects of the Berlin exhibition building, Herr KAYSER and Herr GROSSHEIM; the Austrian sculptor, Herr TILGNER; and the following painters:—Herren GESELSCHAP and FLICKEL, of Berlin; BAISCH, of Carlsruhe; DÜCKER, of Dusseldorf; KLAUS-MEYER, of Munich; RUDOLPH ALT, of Vienna; and Signor AUGUSTE CORELLI, of Rome.

HERR MENZEL, the painter, has been nominated a chevalier of the Prussian Order of Merit. This is the first time of bestowing the dignity on an artist. Although the order was founded in 1842 in order to serve for civilians as the older Order of Merit does for soldiers, the members almost entirely belong to the Government service. ALEXANDER HUMBOLDT received the honour, and so did LEOPOLD RANKE, the historian. It was also bestowed on THOMAS CARLYLE for his "History of Frederick the Great," and never was reward more dearly earned, for the work took all the vigour out of the author.

THE death of M. F. E. SIMON, the inventor of the chromolithographic process, is announced from Strasbourg. He was in his eighty-first year. All inventions are perfected by slow degrees, otherwise it might be supposed that ALOYS SENEFELDER, the actor, who first hit upon the plan of utilising calcareous stones for printing, must have perceived that if one colour could be put on paper, it was practicable to place several beside it by a repetition of the same process. The art has had a good many ups and downs. At one time it was supposed to create plates that were false in art because they were over-coloured, but the success of oleographs suggests that chromolithography was not sufficiently glaring to satisfy the crowd. M. SIMON must have had the satisfaction that his countrymen continued to produce the finest examples of the art.

THE Bishop of CARLISLE proposes that the Church of England should celebrate the QUEEN'S jubilee by subscribing funds for the erection of a Church House. His lordship says:—It has long been felt that the Church of England needs a more distinct local habitation than she possesses at present. There are meetings of all kinds which have to take place in the most miscellaneous quarters, and for some of them it is difficult suitably to provide. The Southern Convocation, notwithstanding the kind hospitality of the Dean and Chapter of Westminster and of the Governors of Queen Anne's Bounty, is miserably housed, while the establishment of the Lay House has added a new problem of accommodation. Should the desire be realised in the gathering together of a body which should represent the whole English Church, the difficulty of accommodation would assume still more formidable proportions.

THE scaffolding has been removed from the great Ecole de Médecine, which is in course of construction in Paris from the plans of M. GINAIN. The style is Classic, of a severe type. A great deal of work remains to be done in the interior, and no time is yet fixed for the inauguration of the school. Another important work, the new Sorbonne, is also in progress in the same district.

THE French people do not believe that they have much to learn from any of the exhibitions which are now open in England. It was proposed to send over workmen, but all the Municipal Council would disburse for the expenses was a thousand francs, or 40*l.* sterling. It was also made a condition that the travelling students were to be selected from Parisian workmen who had been nominated by their trade societies or by the councils of *prud'hommes*. The English innkeepers will, therefore, not gain much this year from the Paris treasury. How the sum can be appropriated in order to allow the men to profit by exhibitions in Folkestone, London, Liverpool, and Edinburgh is more than we can make out, although we are aware that French economy can produce amazing results. Whenever there is an exhibition in Paris a large sum of money is contributed, and a regiment of workmen are sent over. It is evident the French do not wish to show reciprocity in that form at least.

MR. GAMBIER PARRY is about to issue in a volume several of the addresses on art which he has delivered at meetings of societies from time to time. The title will be "The Ministry of Fine Art and the Happiness of Life." The following papers will form the contents:—"The Purpose and Practice of Fine Art," "The Ministry of Fine Art to Common Life," "The Ministry of Fine Art to Spiritual Life," "The Ministry of Colour to Sculpture and Architecture," "The History of Mosaic—(1) Ancient, (2) Christian," "The Art and the Artists of Glass Painting, Ancient and Mediæval," "The Adornment of Sacred Buildings," "Art in Archæology," and "The Builders and Buildings of the Abbey of St. Peter, now the Cathedral, at Gloucester."

GENEVA has set an example to the cities of Europe in setting up freezing chambers on a large scale in connection with the abattoirs. The whole of the arrangements were carried out under the direction of M. EMILE SCHRODER, architect, who has made a speciality of work of a similar class. The meat from the abattoirs is subjected to the freezing process, and it can remain in the chambers until it is required by the butcher. During the hottest weather it will remain fresh, and loss will therefore be avoided. There is no necessity for a large stock in the butchers' shops. Our sanitarians would do well to consider whether a similar innovation might not be feasible in English towns. To see "butchers killing flies," a kind of war which SHAKESPEARE noted, is not pleasant to a gourmand.

THE fire brigade of Paris is not organised on as extensive a scale as Captain SHAW'S, and in consequence several fires which lately occurred have not been extinguished as quickly as was desirable. It was also found that the people were not disposed to become amateur firemen. The Prefect of Police has therefore advised the various commissaries that the ordonnance which dates from December 11, 1852, can still be put in force. According to it, all masons, carpenters, roofers, plumbers, and other workmen are bound whenever requisition is made on them, to proceed forthwith to the place on fire and to bring their tools and ladders. Horses are also to be supplied on demand to the owners. Chandlers and grocers are under obligation to supply the torches which may be necessary in order to give light during the operations. The requisitions can be made by the commissary of police or the officer commanding the firemen on the occasion. It is not supposed that the work is to be gratuitous, for the labour and goods will be paid for on production of a certificate duly signed. But any person who will not comply with the requisition can be prosecuted. The Paris houses fortunately take a long time to burn, otherwise there would be little hope for them with so improvised a service.

SPONTANEOUS combustion is said to be an impossibility, but a phenomenon that at one time would be ascribed to that cause has lately been observed in the suburbs of Paris. In 1871 a fire occurred in a villa. The reparation was carried out under the direction of an architect, and the house has since been occupied by the same owner. One day he observed that the ceiling of the dining-room appeared as if some of the plaster was about to give way, and, as the bulging increased, he called in an architect. He concluded that a beam must somehow have given way, and workmen were employed to make a more close examination. It was then discovered that the wood was almost entirely consumed. Some spark may have remained, and during fifteen years the destruction must have gone on by inches, for no other hypothesis was brought forward than one of very slow combustion. The circumstance is so remarkable as to appear almost incredible, although firemen can relate stories of a similar kind.

MARECHAL DUROC.

"L'ART" having the advantage of the support of the leading painters in France, several etchings after M. MEISSONIER have appeared from time to time in the volumes. We give this week the etching of the figure of DUROC, which is taken from the picture "1807," that was purchased from the painter by the late Mr. A. S. STEWART, of New York.

To DUROC belonged the distinction of being the only man for whom NAPOLEON had a sentiment approaching affection. It was owing to admiration for the stern and resolute character of the artillerist. The story is well known of the grief shown by the Emperor when the Marshal was mortally wounded in the retreat after the battle of Bautzen. During the night he remained in the cottage beside DUROC, and was indifferent to all the appeals which were made to him by his staff for instruction about the preparations for the next day's battle.

7. DOGE'S TOMB, SS. GIOVANNI E PAOLO, VENICE.

NEW STABLES, INGESTRE HALL.

THE new stables at Ingestre, now completed, provide accommodation for over fifty horses, with apartments for grooms, helpers, &c. They are built of red brick and stone dressings from the Tixall quarries, and an effort has been made to keep them in harmony with the old hall, at the same time preserving the character of stable offices.

The plan is quadrangular in form. The principal entrance is on the north side, through the archway surmounted by a tower, built entirely of stone. On either side of the archway are residences for the head groom, &c., sick boxes, and harness and saddle rooms. Of the two side wings of the quadrangle, that to the right is composed of stall stables and that to the left of loose boxes, each wing having a washing place in the centre. The wing at the far end is the coach-house and fodder stores, &c., in front of which a portico, built of stone, gives sufficient space for the washing of carriages and other vehicles. The roofs of cleaning places are open, and constructed of pitch pine, as are also the principals of the roofs to the several stables.

Fireproof flooring and other necessary precautions against fires have been adopted, and water-services are laid on throughout. A thorough and effective system of drainage and ventilation has been carried out, and there is every hope that the different chambers may be thus rendered sweet and clean at all times. Messrs. MUSGRAVE'S fittings have been used in the stables, the floors being laid with yellow clinkers. Accessories, such as mess-room, w.c.'s, dung-pit, &c., are provided for in the rear of the building. Mr. JOHN BIRCH, of No. 8 John Street, Adelphi, London, W.C., is the architect.

THE KING OF BAVARIA'S PALACE.

A CORRESPONDENT of the *Daily News* was fortunate in obtaining permission to visit the palace which the late King of Bavaria erected in the wooded isle on the Chiemsee, and for the following account of the imitation of the Château de Versailles we are indebted to that journal :—

The castle, of which the central building and the right wing only are complete, a mass of granite and solid stone adorned with statues and reliefs and surmounted by an attic at the height of thirty yards, stands upon a broad eminence, which gradually slopes down to the lake on both sides. The view from the windows embraces a park in several terraces, each adorned with waterworks of colossal dimensions, so that the eye has to travel over a mile of nature improved by art, before it reposes upon the blue surface of the lake, encircled by violet hills in the distance. To exclude all else from view a trellis-work, which in the course of years will form a green wall, fifteen yards high, is raised on either side, at first wide enough to comprise the terraces and fountains, and narrowing as it slopes down to the lake, but always spacious enough for a broad lawn in the middle and two carriage-drives on either side. As we slowly ascend these drives from the lake the dimensions of the castle, which are underrated at a distance, gradually appear, and by the time we have reached the lowest terrace we are fully aware that we have one of the finest buildings in the world before us. The centre of the lower terrace is occupied by the Latona fountain, consisting of five basins of red, green, and yellow marble, rising one out of the other. The lowest is surrounded by sixty-four gilt metal tortoises and crocodiles, each the size of a man, from whose open jaws thick jets of water rise, and fall into the basin above. Here monstrous golden frogs alternating with strange beings, half men half animals, rise in strange confusion, and higher up in the centre of the fountain kneels Latona, in all the grace of youth, one arm outstretched in supplication, the other wound around the baby form of Apollo. The seventy-two jets of water are so arranged as to pass over the white marble group of Latona and Apollo, who are seen in a huge crystal globe, which the sun's rays gild and colour. The water jets alternately rise and fall, forming a thousand broken reflections and myriads of flitting diamonds around the strange forms to which the movement of the water gives animation and warmth. At either side of the Latona fountain two huge basins throw up thick jets of water which can be seen from all the country around. Twenty broad steps of Bavarian granite lead to the terrace above. The centre is a gravel square, which allows an unobstructed view of the palace and its three golden gates, to which, however, rises another flight of granite steps. On the large terrace there is an oval fountain at either side, gracefully curved and adorned at each of its twelve angles by colossal statues and groups of gold river gods, sprites, and groups of children. The gilding of the bronze is so new that the eye longs for something else to look upon, and for repose from all this glaring beauty. In the centre of the fountain to the left rises a rock, twenty yards high, upon which allegorical figures show the fate of good and evil. In the shade of palms upon a Sphynx is seated Clio, who inscribes the names of the great upon her tablet; above her a warrior, sword in hand, climbs up the rock to fame, encouraged by a winged Victory, alluring him with a laurel wreath held on high. At the top of the rock a winged genius of light upon a horse blows his trumpet to the skies, while the undeserving lie in a motley crowd under the horse's hoofs. On the other side of the rock one figure is being precipitated down, and below an agonised woman awaits its fall. Enormous dragons guard the rock, which is covered in all its parts by ferns, palms, and lichens, from which jets of water fall into the basin below. All the figures on the rock are of bronze and double life size.

On the other side, a similar fountain with twelve gilt statues surrounds a rock crowned by Fortune on a wheel, distributing her gifts, fruits and flowers, to maidens kneeling to receive them. Four dolphins guard this rock, which is surrounded by smaller rocky islands upon which groups of children play among ferns and water-lilies. A little beyond two fountains of white marble are peculiarly interesting. A large square basin, measuring certainly ten yards in diameter, is filled by jets of water falling from the jaws of a golden lion and a golden leopard seated on the front parapet. This basin is allowed to overflow into another marble basin in the ground, at either side of which a marble statue, copied in beautiful Carrara from the classics of old on pedestals of grey marble, stands erect. It is impossible to describe the beauty of the contrasts produced by this mixture of brown bronze, white marble, and gilt metal, toned down as it is everywhere by the graceful fall of transparent showers. Orange trees in full bloom, scenting the air, formed a row of bright verdure on the background of dark pines whose growth had been forced into the forms required. Up the last twelve steps of granite, across the last terrace to the arched portico, and the golden gates are opened ajar to admit the visitor, first into a marble entrance hall with many pillars supporting the hall above. In the centre, on a pedestal of red marble and a tall vase of a rare violet stone, stands a peacock in enamel, copied so exactly from nature that the sheen on its splendid plumage seems real until our hands have touched the cold metal of which it is cunningly formed. Through this hall we pass to the back of the house, where a handsome courtyard paved with white and black marble is enclosed on three sides by the central block of buildings. The entrance hall is still unfinished, granite and brick and rafters are still visible in all their crude ugliness, when suddenly a gate of gold is thrown open, and a shower of light and colour meets the eye. It is the staircase—white polished marble under our feet, opaque glass over our heads, and between the two extremes all the wealth of Golconda, if Golconda owned artists. The stairs of white marble, half concealed under ruby velvet, rise to a narrow platform, where they divide to a double flight of steps guarded by a balustrade of brown and white Piedmontese marble, topped by a parapet a yard broad. On the outside the house seemed to have two stories, inside these have disappeared and every apartment rises from first floor to roof, the staircase taking up the whole height of thirty yards. Eight large pictures painted in bright and joyous colours, and parted from each other by porphyry columns with golden capitals, cover a part of the

walls; these are surmounted by a frieze of white marble, the figures standing out boldly, some reaching with their graceful limbs to the pictures above and below. Above the marble, alternating with gold in all parts, is a row of charming pictures representing children playing in the clouds and the blue heavens above.

The subjects of the large pictures are all suggestive of the great work which began with the staircase. A merchant from India lays out his precious goods, the gold and ruby textures, strings of pearls, plumage of birds; from them a youth—the King—is selecting what will adorn his home. On another canvas a sculptor, a goldsmith, a painter are hard at work. Beautiful maidens, strong men, bring from field and garden fruits and plants to increase the wealth and beauty of the whole. One picture shows a group of splendid women doing homage to a young Apollo in a regal mantle, who seems to point to another frame, where Cythera thrones as queen of beauty. On the first landing a deep niche interrupts the red marble wall. It is filled by a graceful marble figure of Diana with two slight girls at her side, under whose feet a rill of water flows into a shell below. The background is pale green marble and is polished so cunningly that it forms long perpendicular reflections, which deceive the eye and lead the beholder to believe that Diana and her maidens are concealed behind a veil. The delusion is so complete that many a hand will be outstretched to draw that veil aside. On the two higher landings white marble statues much over lifesize are placed in niches of polished black marble. One is Minerva, the other King Louis XIV. in the garb of a Greek god. A folding door opens upon a series of apartments, loftier than it is possible to picture to oneself, each comprising two distinct rows of windows above each other, the intervening space filled by pictures from many a master hand, the draperies in velvet covered with gold embroidery an inch high; the floors of rosewood inlaid with designs in a darker colour, chimneys of marble, the mantelpieces bearing clocks and vases of Sèvres, signed by all the noblest names in French art. Not a single room resembles another, each is a complete masterpiece and in itself so beautiful that the mind refuses to believe anything more lovely still can follow. The paintings on the walls never take the form of pictures in the ordinary sense. They form part of the wall itself, and are set with the fantastical gilt ornaments of French Renaissance, which also frame the mirrors and the tapestries. The tables are either polished stone, lapis lazuli, malachite, or painted porcelain and inlaid wood, the arm-chairs, stools, and sofas carved wood gilt, and gold embroidered velvet, the candelabra gilt bronze, venetian glass, or Meissen porcelain.

The front of the middle building with its twenty-two windows below, opening upon a narrow balcony, and its twenty-two windows above, is entirely taken up by the large gallery of mirrors, which is flanked by two halls having six windows at the side, that are separated from the gallery by high columns only. That human mind should have conceived a hall of such dimensions seems well-nigh incredible even to those who have paced to and fro in it. Notwithstanding the enormous space, it does not look empty or desolate. The ceiling is arched, and the paintings, which commence on the walls, gradually pass to the ceiling, where pictures in rich harmonious colours alternate with bronze reliefs of a pale green colour, both framed in rich ornaments of gold. Opposite the twenty-two windows are as many mirrors, and the space between windows and mirrors is taken up by tall gilt metal candlesticks, eight feet high. In front of every mirror and in front of every window stands an antique vase of silver, five feet high, and beneath it a canopy in carved wood gilt, covered with deep blue velvet, upon which five rows of gold embroidered lilies an inch high produce a marvellous effect. Imagine all this repeated forty-four times over, and add to it the wealth of colour in the paintings on wall and ceiling, from which moreover descend three rows of candelabra of gilt bronze, with fifty candles each! In eight niches stand white marble copies of the noblest works of classic art, the Venus of Milo reduced to natural size, the Medicis, Diana, and Niobe. On columns of malachite are placed busts of the French generals of the seventeenth century, no heed being taken that their victories signified as many defeats for the country whose King has placed them in his gallery. The subjects of the pictures all treat of the life of Louis XIV. His great and small deeds are immortalised by the brush of the painter, and it is a wonder that the King's self-immolation did not go so far as to picture even the devastation of the Palatinate. While gazing on high I was afraid my eye would meet the Castle of Heidelberg, as it is being destroyed by the French scourge, which nearly reduced it to ashes. At either end of the hall the pictorial art on the ceiling passes over into the plastic, and many figures are half painted and half modelled; a *scherzo* which is copied from the French Renaissance in its less desirable forms. The rooms at either end of the gallery of mirrors contain marble chimneys, one surmounted by a colossal marble relief, the other by a painted portrait of Louis Quatorze. That famous King's most autocratic opinions which our democratic days scoff at seem to have been held in high esteem by the Bavarian Louis, for there are idealised portraits of the French King with inscriptions below, such as "L'état c'est moi! Le roi gouverne par lui mème!" words which at Herrenchiemsee it cost me no effort to believe King Louis repeated while he gazed at his portly form in one of the thousand mirrors there. Before leaving the gallery I will add a few figures which will prove that my astonishment is based upon sound foundations. The hall is 260 Bavarian feet long, 38 feet broad, and 45 feet high. It takes 2,500 wax candles to light it. The floor is of light brown rosewood, inlaid with dark laurel wreaths and the lilies of France; the windows are hung with solid white lace, and concealed behind white blinds.

The next marvel and the greatest is the Royal bedchamber, a lofty room of moderate dimensions, with three windows above and below, the upper being draped with crimson silk that throws a magic light upon the masses of gold distributed all over this regal apartment. It is divided into two parts by means of a golden balustrade, the back part being rounded. Here the King's bed stands on a raised daïs, up to which lead five broad steps, covered with ruby velvet on which are embroidered large golden suns. The bed is of gilt bronze, a work of art as we meet it once in a lifetime. It is covered with a counterpane of gold cloth, embroidered in colours, the centre representing King Louis XIV. without his wig, a large emerald on his breast, a sapphire in his hair. The bed is surmounted by a canopy of gold with a high crown of gold in the centre and four enormous bunches of white plumes at the four corners; from the canopy descend the curtains, to examine which a lover of art will devote several weeks. The outside is ruby velvet embroidered in gold, so that of the ground colour scarcely anything is seen; the inside is covered from top to bottom by pictures from the Bible, at first sight the produce of the miniature-painter's brush, but, on close inspection, the triumph of the needlewoman's skill. Where could the hands be found that in the short space of a few years could cover twenty square yards with such marvellous work? The centre of the background is occupied by a sun embroidered in diamonds and pearls; and when I heard that the King never once used this bedroom, I was led to believe that he expected a visit from the Roi Soleil himself, and hoped to astonish even his magnificent majesty. The walls of this room are entirely hung with red velvet embroidered in gold, the children holding garlands of flowers being so solid that a real baby held to the wall cannot stand out from it more boldly than do these works of the needle. On one side of the bed, within the space confined by the golden balustrade, is the washing-stand, a tall mirror in gold arabesques, the table of marble supported by gilt bronze figures—the basin, ewer, and ten vases in gilt bronze of a size that would astonish even a giant, and of a beauty that it is impossible to describe. The other side of the bed is taken up by a prayer stool in ruby gold-embroidered velvet, the background filled by a St. Michael in colours, of such splendid workmanship that the original by the miniature painter, upon which the stitches were worked, must be less beautiful. Above the prayer stool there is a tiny altar with a copy of Raffaele's *Annunziata*, which, with the prayer-book it adorned, was sold by the Perugian family that had owned it since Raphael's time to the Empress of Russia, who in her turn lent it to King Louis, one of her great favourites in the years that preceded her illness. On the right and on the left side there are armchairs of gilt carved wood, the arms supported by erect children, seat and back covered with gold-cloth, on which a frame of gold embroidery surrounds a group of children embroidered in colours, works of art that should be kept in a museum. The room contains besides six stools of similar workmanship, two white marble chimneys, with Sèvres vases of red porcelain, and quaint old clocks, two mirrors filling the space between the three windows, where tables of dark red marble support Sèvres candlesticks formed of a hundred flowers and fruits, placed at either side of alabaster groups of graceful girls. The velvet hangings on the walls are parted in several places to admit paintings framed by rich arabesques, which form a frieze surrounding the painting on the ceiling, a splendid mass of beautiful forms and beautiful colours. Helios is driving the sun, and the hours dancing round him. The King's attendant told me that Helios some time ago was a splendid likeness of the young king himself, but that one day he gave orders to have his features erased, and now Helios is none else than the perpetual Louis XIV. himself.

Next comes the Council Room with a large table in the centre and a truly royal chair of blue velvet embroidered in golden stars. Rich chimneys, splendid clocks, some of them eight feet high, velvet draperies, marble busts, pictures, and tapestries everywhere, but no mirrors. Somewhere in this neighbourhood is the king's own bedchamber, which he has used during the three visits to Herrenchiemsee. It is very much like the Sun King's rooms, only more habitable. Instead of three it has two windows—the ruby velvet is replaced by deep blue, the steps to the daïs on which the bed stands are three instead of five, the suns of gold on it are half the size. No plumes surmount the canopy, but the embroidery in colours is even handsomer. A life-size picture of the Crucifixion takes

up the background, the curtains are worked in pictures from the New Testament, the prieu-dieu is exactly like the one in the other room—of course nothing more suitable could be found than Raphael's *Annunziata*. The washing-stand is quite as splendid; but it is just possible to use the vases of blue Sèvres and gilt bronze; a Brussels veil half conceals the mirror, folds of Brussels lace fall from the toilette table to the ground; the walls in blue velvet gold-embroidered, the gold ornaments, the chimney-pieces—everything is quite as beautiful, but more human. Near the prie-dieu a small door opens to a winding staircase, which descends to the dressing-room and bath below. The table between the two windows is one enormous piece of lapis lazuli, the candlesticks blue china, with an Ariadne between them. On the mantles vases of English ware stand on either side of a quaint clock. That to the right represents a bronze statuette of the King, who is outstretching a delicate hand to stop Time, represented by a globe encircled by the dial, which moves round. But the hour, a graceful female figure, stops the king's hand, and seems to show that even kings like Louis have no command over Time. This clock, in the King's own bedchamber, is certainly a new clue to his character. On an easel near one of the fire-places there is a picture of young Louis Quinze in regal robes, handsome and arrogant to a degree, another clue to the King's character. In a writing room close by there are busts of Louis Quinze's four mistresses, and on an easel a picture of Maria Lexinska. In the panels of the walls there are pictures of Versailles, with the Court and the King, generally the centre of gaieties such as poor Bavarian Louis never dreamed of for his solitary self. The dining room is the best proof of his love of solitude. In the centre of the room a high armchair stands at a round table, which upon the least sign from the King descends to the ground floor of the castle, and reappears with the next course, enabling the King to dine without having seen a human form or having heard a mortal voice. Before concluding, I must mention two small rooms, the jewels of the whole place, one being the ladies' boudoir, the other a smoking room for the King. The former is a small apartment with two windows, the walls covered entirely with mirrors, separated from each other and from the ceiling by a hundred thousand roses of gilt china, which hang in garlands from the ceiling, fill all the corners, form the chimney piece, and frame a niche containing the only seat in the room, a sofa of pale blue satin with soft cushions, but no back. The candelabra are of roses; the ceiling of white china has exquisite miniature paintings from which men are excluded. There is Atalanta without Meleager, Dian without Apollo. To imagine anything more exquisite than this room is simply impossible.

The smoking-room has one window only, the embrasure filled by a sofa of white satin, upon which are worked sylvan scenes of exquisite beauty, the woods beloved by the king, the lake which had such fatal attraction for him. The writing table is pale blue velvet in the middle and porcelain painting on either side. Two Sèvres candlesticks and several small porcelain groups of priceless value give it an air as if it had been used but yesterday. In this room the tables, the chimney-piece, the frames of mirrors and tapestries are all of painted and sculptured china; the folding doors have four china panels, each framed by blue china, surrounded by golden arabesques. Into each panel is painted a delicate figure representing one of the Seasons on one door, one of the Elements on the other. I firmly believe such doors have never opened upon such a room before. The floor is of bois de violettes and gives a delicate perfume to this and the adjacent room. Another long gallery completes the suite of nineteen rooms.

My description is so very imperfect that I must add some remarks for the use of those who like myself have seen the Château de Versailles, the Winter Palace in St. Petersburg, Peterhof, and Zarskoje Selo—and who will attempt to compare these with Herrenchiemsee? It should be remembered that in all these palaces the mirrors, the gildings, the hangings, and the pictures are old; that in Herrenchiemsee all has been completed but yesterday, so that the bright splendour is quite incomparable. In many instances the intentions of Louis XIV. were incompletely carried out or left out altogether, because the cost was too high and the means of transport were imperfect. Bavarian Louis has studied all the plans, has read all the available literature on the subject, has travelled to Versailles and back a hundred times, and has carried out the magnificent King's very dreams of splendour. Thus the fountains in front of the Castle do not exist at Versailles, because having been made of plaster a storm destroyed them soon after their completion, and they were never restored according to the old designs. When the King viewed what his mind had created and his eyes glanced over the hundred rooms that exist merely in brick and mortar, across the empty space where the second wing was to stand, what wonder if his mind went astray as he perceived the total impossibility of ever completing what would in history have given him a place with the most magnificent princes of times of old? His valet told me that he paced the mirrored hall and all the other apartments in the light of six thousand candles, his steps resounding in the solitude, his ever-silent lips for once apostrophising the images of the dead around him until night changed to morning. Then he would step out upon the balcony, and while the sun rose over the hills, by one slight movement of his hand, set the waters working in the fantastical forms his mind had created for them, and in the glow of early morning, amid the rushing waters, with beauty around, his eyes would be raised heavenward, and he perhaps deemed himself one of the gods.

THE COCKBURN ASSOCIATION.

THE eleventh annual report of the Cockburn Association for the improvement of Edinburgh and its neighbourhood has been issued. It begins with a notice of the proposal for the restoration of Edinburgh Castle, in regard to which the Council record their gratitude to the Government for the work they have already accomplished, and express a hope that it will not be long before a general scheme of improvement is undertaken. The thanks of all Scotsmen, the report goes on to say, are due to Mr. William Nelson, who has undertaken the restoration of three of the most interesting and picturesque features of the castle. The report also takes notice of the restoration of St. Bernard's Well, which Mr. Nelson is at present effecting. The Council hope that the proposal for the restoration of Holyrood Chapel, in commemoration of the jubilee of Queen Victoria, will be successful. They suggest also that something should be done to improve St. Margaret's Well, which is at present in a lamentably neglected condition. They draw attention to and condemn the practice of painting the stone fronts of houses and shops in unbecoming colours, take notice of certain advertisement hoardings, and point out that the North British Railway Company are at present erecting brick buildings at the Waverley Station, which, as seen from the North Bridge, are an eyesore. They urge that something should be done to make these buildings more in harmony with the architecture of the city generally. They express the hope that the seats at "Rest and be Thankful," which have been again put up, will be protected by the public. In conclusion, the report refers to the death of Bishop Cotterill, who was a member of the association from its commencement, and took an active interest in its work. The total charge for the year has been 83*l.* 3*s.* 5*d.*, of which 27*l.* 4*s.* represents subscriptions, and the expenditure has been 27*l.* 11*s.* 7*d.*, leaving funds in hand to the amount of 55*l.* 11*s.* 10*d.*, of which 50*l.* has been placed on deposit receipt.

ROYAL ACADEMY ARCHITECTURAL SCHOOL.

THE following are the latest admissions to the different sections of the Architectural School:—

Upper School.—L. Dennis, F. J. James, W. Leck, C. F. Mallows, H. Manning, E. H. Selby, H. D. Walton, and C. Wilson.

Lower School.—A. M. Butler, H. S. Daniels, W. M. Duke, E. C. Frere, F. E. Haarer, C. H. Hopson, J. M. Murray, G. W. Nicolay, R. W. Paul, C. S. Spooner, N. Taylor, W. R. Wilson, H. E. Woollacott, and L. Youngs.

Probationers.—F. R. Bance, A. C. Blomfield, R. Bryden, B. F. Fletcher, H. A. Gregg, H. V. Lanchester, J. P. Oliver, V. R. Page, and H. A. Wilson.

Bygones.

"*Antiquity after a time has the grace of novelty.*"—Hazlitt.

GERBIER'S COUNSEL TO BUILDERS.

ABOUT the middle of the seventeenth century there were more than thirty English and foreign painters in England who were of some note. The majority belonged to the Flemish school, the greatest being Rubens. One was the miniaturist, Balthazar Gerbier, who was also a "Jack of all trades," for he dabbled in architecture, literature, and diplomacy, as well as in painting. The statesmen of the time found him a very useful spy. His life was made up of strange vicissitudes. Gerbier accompanied Prince Charles and Buckingham in the romantic expedition to the Spanish Court; he was master of ceremonies at the English Court; he made a voyage to Surinam; he bought and sold pictures; and he set up an academy in Bethnal Green, where everything was to be taught, including, we suppose, deportment. Gerbier, being a universal genius, designed houses, and assumed Inigo Jones's office of Surveyor of the Palaces. Among his books is one entitled "Counsel and

Advice to Builders." The late Mr. Sydney Smirke, R A, gave the subjoined account of it in a paper which was read before the Institute of Architects :—

The earliest edition of Sir Balthazar's "Counsel and Advice" is 1663. The early date, therefore, of this book gives it a value, and a stronger interest attaches to it in our eyes, as giving some insight into the practice of architecture at the period of our great master, Sir Christopher Wren. Sir Balthazar was born at Antwerp in 1592, and was brought up as a miniature painter. He was knighted by Charles I., and was employed by him, in conjunction with Rubens, to negotiate a treaty with Spain; he also resided at Brussels in a diplomatic character. He was subsequently employed as an architect by Lord Craven.

The treatise commences by adverting to the author's previous work, which he describes as a little "manual, concerning the three chief principles of magnificent building, viz. solidity, conveniency, and ornament;" wherein he "notes the incongruities committed by many undertakers of buildings." He points to the Grecians and Romans as the best builders, and urges that men should not be subject to fancies nor "inslaved by weathercock-like spirits, to make their buildings according unto things *à la mode*." He further condemns the incongruity committed by surveyors, "who were minded to show that they were skilled in describing columns, cornishes, and frontispieces, although, for the most part, placed as the wilde Americans are wont to put their pendants at their nostrils."

The author then proceeds to treat more particularly of his advice to all builders. "Whoever," he says, "is disposed to build ought, in the first place, to make choice of a skilful surveyor, from whose directions the several master workmen may receive instructions by way of draughts, models, and frames." I should here say that the author throughout uses the terms surveyor and architect as perfect synonyms; there is no indication whatever of that distinction which is now, in England at least, universally received. He then adverts to some of the requirements of architects, and especially dwells on the knowledge of perspective as essential; he teaches that the architect should consider the ground whereon the building is to be erected, and then govern himself as the ground will give him leave; or, as Pope has since more elegantly expressed it, "consult the genius of the place." He must place the front of a country house towards the east, "by which means he may shelter his double lodging-rooms from the north-west." I cannot say that this piece of instruction is very intelligible. We can hardly regard the north-west as the aspect most to be shunned. The author here adds what he quaintly calls a *nota bene* to builders, viz., "he must cause all the back of his stonework (which stands within the brickwork) to be cut with a rebate 3 inches broader than the breadth of his jambs and cornish, which will hinder the rain from piercing into the inside of the wall and through the meeting of the brick and stone." He deems it necessary to make a sort of apology for this advice, as implying that

> Surveyors and master workmen in this refined age which abounds in books, with the portractures of the out and inside of the best buildings, are to seek the first points of their apprentiship; of whom I ask the reason why modern buildings are so exceedingly defective; and whether it is not because many of them have been but apprentices lately, and too soon become journeymen; and that surveyors (who either affect more the building to themselves a strong *purse*, or are blind to the faults which their workmen commit), like careless postillions, hasten with the packet maile to the post-office, be it never so ill-girted, whereby it oft falls in the midway.

The author then advises how to try the capacity of a surveyor :—

> "The readiest way to try him," he says, "is to put him to draw a ground plot in the builder's presence; to make him describe the fittest place for a seat; the ordering of the rooms for summer or winter; to contrive well the staircases, doors, windows, and chimneys—doors and windows so placed that they may not be inconvenient to the chimneys—the bedstead place from the doors and windows, and of a fit distance from chimneys."

He then adverts to the "seelings of rooms," adapting their height to the size, character, and use of the room. A bedchamber of state may be 30 feet wide, 40 feet in length, and 16 or 18 feet high; whereas a closet, 10 feet square, adjacent thereto, if made of the same height, would be "preposterous, and like a barber's comb case." The dimensions here set down for a state bedchamber seem somewhat extravagant; but it must be remembered that our author's advice is apparently addressed to royal or noble builders, and in the seventeenth century business was transacted, and morning visitors were received, usually in the bedchamber, a practice which, at the present day, has not fallen altogether into desuetude on the continent.

The author then proceeds to the subject of exterior architecture. He points out the necessity of cornices over doors and windows, to prevent rain from falling on them, which he illustrates in his usual quaint way, by comparing a "cornish" to the "broad brim of the good hat of a traveller in a rainy day."

"The good surveyor," he adds, "will order ornaments to the front of a palace according unto its situation; shun too much carved ornaments on the upright, whereat the southerly windes raise much dust;" also "shun those spectacle-like cant windows which are of glass on all sides, for it may be supposed that the inhabitants of such houses and rooms with cant windows (exposed to the north-west) may well imitate a merry Italian fisher, who in a winter, windy, rainy day, had been stript to his skin, and having nothing left to cover him save his bare net, wherein he was wrapt, put his finger through one of his holes, asking of passengers what weather it was out of doors." It is here to be observed, that at the period when our author wrote, Classical architecture, on its revival, was still struggling with the Gothic forms that had prevailed for so many centuries previously. These cant or bow windows were peculiarly characteristic of the Tudor and Elizabethan ages, and so firmly rooted were they in the domestic habits and usages of the time, that the revivers of Classical architecture were driven to make many attempts to retain the old favourite form with a new dress; and down to the present day we seem to have remained true to the old spectacle-like cant window of our forefathers, which, whilst it is almost universal in England, can scarcely be met with in modern architecture on the Continent.*

Sir Balthazar then proceeds to give us advice of not a very important nature on the subject of balconies, balustrades, and cornishes. He says that the Grecian and Roman surveyors ever made the cornishes and ornaments about the windows of the upper storeys to be bigger than those on the lower, and illustrates his remark by a somewhat pedantic reference to Michel Angelo, Raphael d'Urbino, and Albert Dürer. He then teaches us as to the proportions of doors and windows. The chambers of a palace, he says, should have the doors wide enough for two to pass at once, and the height to be double the width; all other chamber doors should be convenient for a man of complete stature to pass with his hat on. Windows must be higher than they are wide, because light comes from above, and the middle transome should be above 6 feet from the floor, otherwise the transome would be opposite a man's eye; "hindersome," as he says, "to the free discovery of the country." The leaning height of a window should be 3½ feet, and not so low that wanton persons may sit on them and break the glass, or that they may show themselves *in cuerpo* to passengers. "A good surveyor," he says, "shuns the ordering of doors with stumbling-block thresholds, though our forefathers affected them, perchance to perpetuate the ancient custom of bridegrooms, who, when formerly at their return from church, did use to lift up their bride, and knock her head against that part of the door, for a remembrance that she was not to passe the threshold of their house without their leave."

"Doors," he says, "should be on a row, and close to the windows, that when the doors are opened they may serve for screens, and not to convey wind to the chimney."

The hearth of a chimney ought to be level with the floor, and chimney mantels ought to be of stone or marble. It is necessary to cover the top of chimneys to keep out rain and snow: the smoke-holes can be very conveniently made on the sides of their heads. Had the knight lived in these times he would doubtless have been very severe, in his quaint way, upon the monstrous fashion of modern chimney-pots.

"Roomes on moist grounds do well to be paved with marble," and "a good surveyor shuns the making of timber partitions on the undermost storey." "The good surveyor doth contrive the repartitions of his ground plot so as most of the necessary servants may be lodged in the first ground storey, whereby there will be less disturbance, less danger of fire, and all the family at hand on all occasions." "Finally, he ought from time to time to visit the work to see whether the building be performed according unto his directions and moulds."

The author then proceeds to a chapter on clerks of works. "A clarke of the werkes," he says, "must be verst in the prices of materials and the rates of all things belonging to a building; know where the best are to be had; provide them to the workmen's hands," and so on, adding that "though nails to some seem not very considerable, yet ought the clarke of the werke to be discrete in the distributing of them to some carpenters whose pockets partake much of the austruche's stomach." "His eyes must wander about every workman's hands, as on those of the sawyers at their pit, so that they waste no more than needs in slabs; on the laborers' hands in the digging of the foundation for the bricklayers, that all the loose earth may be removed and springs observed."

Some of the ordinary duties of a clerk of the works are then enumerated; as, that he should prevent bricks being tumbled

* Lord Bacon, who wrote somewhat before the date of this book, had none of our author's prejudice against these embowered windows. "I hold them," says he in his well-known essay on building, "of good use, for they be pretty retiring places for conference; and besides, they keep both the wind and sun off, for that which would strike almost through the room doth scarce pass the window."

out of the cart; that he should suffer no sammell bricks to be made use of, and that he should not suffer the bricklayers to lay any foundation except the ground be first rammed, though it seem never so firm. "No great and small stuff," he says, "should be huddled together in the foundation, but all laid down as even as possibly can be, to ram it the better and the more equal, and must be of solid hard stuff with no concavities daubed over with store of mortar," and he adds here in a marginal note that these precautions were observed in building the foundations of Solomon's Temple, but he does not give us his authority for this information.

The clerk of works is further to see that the line-and-plumb rule be often used; that the bricklayers make small scaffling holes, and never suffer them to begin scafflings in the morning, but before leaving of their work; "for if in the morning," he says, "most of them will make it a day for the gathering of nuts."

Then follow some injunctions respecting mortar that I scarcely need particularise, and the author proceeds to the subject of masonry. The workmen must observe exactly the surveyor's moulds, and work close and neat joints, using but little mortar between them, not only because much mortar will be washed away, but that cornishes will also appear like a rank of open teeth; and they must not forget to shore up the middle part of the head of the windows, as well as the sides, to prevent an unequal settling of the work, and, consequently, cracks. There here ensue, for the next thirteen pages, detailed directions for the proportioning of the several orders.

"It is the rule of the ancient masters, whose reliques, to be seen throughout most places of Italy, make many strangers that come their gape so wide as that they need no gags."

The author now enters upon the subject of carpentry. He teaches:—

That the carpenters should be good husbands in the management of the builder his timber; on the cutting of the scantlings; their sparing to make double mortices, which do but weaken the summers. To lay no gerdes which are needless and hindersome to the bording of a room; no summers to be laid except the ends of them are either pitcht or laid in loam to preserve them from rotting, and therefore in Italy, France, and Germany, and among the most prudent and solid builders, the free masons, put stone cartouches in the top of the inside walls which are bearers to the summers, as such cartouches are seen in divers churches, and some of them are carved in ornamental figures.

He alludes, no doubt, here to the stone corbels upon which we sometimes see the ends of principal timbers resting: an excellent old practice which we in our own days follow, although in a much less picturesque way, by inserting the ends of our timbers into cast-iron shoes projecting from the face of the wall. The utilitarian tendencies of modern practice have been very subversive of the old picturesque ways of our ancestors, whether on costume, furniture, or architecture. An upholsterer now ascertains with precision the size of the piece of oak that will carry his table; he seeks till he finds the safe minimum scantling, and this successful discovery is the triumph of his art. Whilst our forefathers would take a log of oak, unregardless of this politico-economical search after the greatest possible strength with the least possible stuff, and would carve it into one of those ponderous and fantastic legs which charm us by their quaintness, although they defy our efforts to lift them.

In further illustration compare the broad, deep, capacious fireplaces, whereby our forefathers would warm themselves, with the scientifically-constructed, snug, Rumfordised stove, with bevelled cheeks, no hobs, contracted openings, all contrivances admirably adapted to meet our modern requirements of convenience and economy; but how destructive to the poetry of grandsires' ruder arrangements!—men of rough, bold stamp, who, provided they secured to themselves a warm chimney corner, appeared to regard with great indifference the minor evils of smoke and blacks.

Then follow many other details of the manner the carpenter is to lay his timber, and the author adds that the clerk of the works must be very careful not to suffer the carpenters to lay any timbers under the chimneys, "whereby many houses have been set on fire, and burnt to the ground." We have then a variety of scantlings for the timbers of floors and roofs, which scantlings he gives as fit for substantial structures, but which are "not usual in lime-and-hair birdcage-like buildings"—a remark that leads us to the conclusion that the flimsy structure of modern speculators was not wholly unknown to our ancestors. The care of the clerk of the works must also be on "materials of weight, as sauder, wherewith an unconscionable plummer can ingrosse his bill." In this respect we see that two hundred years' experience has not advanced us—we have still "unconscionable plummers." "The clerk is to see sauder weighed and well managed, and in the attesting of bills have a care not to pass his eyes slightly over them, lest when a plummer sets pounds of candles used about his sauder, that trick prove as insupportable as that of one who, having played away a round sum of his master's stock in a journey to the East Indies, set down in his bill to have paid a hundred pounds for mustard."

He must likewise have a clear insight on the glass paines of the glazier; suffer no green paines of glass to be mixed with the white. He must with his eyes follow the measurer of the work, his rod or his pole; so the line wherewith the joiner's work is measured, that it be not let slide through the measurer's fingers, since the joiner's work hath many goings in and out, and a leger-de-mayne may be prejudicial to the paymaster's purse. It were likewise better to agree with painters to have their work rated on running measure and on the straight, as the carpenter's work, who (being of an honest Joseph's profession), are as deserving to be well payd as the painters, who do but spend the sweat of wall nuts (to wit, oyle), the carpenters that of their browes.

As for coverings of buildings, lead is best for churches, for who would rob them but Goths and Vandals? Blue slates are most comely for a nobleman's palace; "a roof covered with them is of an equal colour, when as red tiled roofs the least breaking of them makes great chargeable work for the tiler, who often removes ten tiles to lay two new ones in their place, and renders the nobleman's roof like a beggar's coat."

Our author then proceeds to some remarks on the making of bricks, and recommends the clerk of works to look well to the working of the clay, which, if not well wrought, will never make good bricks. He says that it is usual to pay 5*s.* per thousand for making and burning bricks, the clay-digging therein comprehended. He then goes into some details as to the relative expense of making bricks and purchasing them made, whereby it appears that only 6*s.* 8*d.* is saved in 20,000 bricks by making them. He says that of clam-burnt bricks 500 out of 20,000 are unfit for work.

Various other details are entered into respecting the making and use of bricks. Men dig clay, he says, for 6*d.* the thousand; lime is burnt at 4*s.* per load, and costs 40*s.* a load. Touching the use of chalk in building walls, he says that "those that mend the making use of chalk in their walls must be contented (if the ground hath springs) with the green mould which breaks thro' the whitened walls within doors. Walls about a parke or court may be *fited* with chalk, which may be digged for 18*s.* per load, and brought for 2*s.* 6*d.* the load." "Good country bricklayers do work at 27*s.* the rod, the bricks not being rubbed. Good London bricklayers will work the rod for 40*s.* with rubbed bricks; the inside for 33*s.*, arches comprised."

Then follow some remarks about lime-burning, describing the mode of burning it "in China and other parts of the Indies," wholly with wood and not in kilns.

Our author now proceeds to a new division of his work, which he heads, "As for Choice of Master-Workmen." "King Henry the Eighth," he says, "showed a good precedent when the serjeant plummer, calling his workmen to caste, in his presence, a leaden medal which was given him:" the king told him "he would have no walking master-workmen." Those, therefore, which are fit to be employed are working masters, and not those who walk from one building to another; "nor will any master-workman deny to have had as much more done and well, by bestirring their hands and tools in their workmen's presence than otherwise." I cannot refrain here from calling your attention to the singular social change that has taken place since King Henry inflicted his reprimand on the walking instead of the working master. Fertile as he is said to have been in oaths, certainly no usual oath would have sufficed to express the royal indignation had he lived in these times, to have seen the master-workman not walk, but drive up to his works in as fair an equipage as that of any of his most favoured courtiers.

We have next a division of the work entitled "As for the Builder and Proprietor." He advises the builder (by which term he always means the employer) to buy his own materials, and to have in reserve such a stock of his own as he can well spare, and also, he adds, "against the mistakes of workmen, a stock of patience;" nor to begin building walls before March, nor after the middle of September.

The next twenty-eight pages contain a variety of miscellaneous and not very well-assorted notes respecting the prices of materials and workmanship.

Touching the paving of courts, to prevent the overgrowing of grass and the charge of too often weeding, he says, "It would not be amiss to lay chalk or lime under the paving, and to do the same in gardens under gravel walks"—a piece of advice which is well worthy of notice.

With respect to street paving with pebble stones, he alludes to a M. Le Cœur having recently introduced great improvements in paving works done under the commissioners. This French undertaker appears to have formed a company for carrying out a new invention in paving, "whereby they are not only able to make a most substantial good pavement, but are likewise capable by that same new invention to maintain it durable for twenty-one years." Our author (who, as must have been observed, is remarkable for the want of order and method in his remarks), brings his book to a close with some what he calls necessary notes. "What contributes more to the fatal

end of many a good mother's son is ill-building: paper-like walls, cobweb-like windows: doors made fast as with packthread, purposely made to tempt men who, through extreme want, are become weary of a languishing life, and to whose fatal end ill-builders are in a manner accessory." He says that the scarcity of thieves vaunted of by the Hollanders, German, and other northern nations, is to be attributed to the defence they are wont to make against thieves: he then describes very particularly the Hollanders' mode of making outside window-shutters so secure by fitting them very closely to the reveals, and by a careful arrangement of the bolts and hinges, precautions which, however necessary, certainly do not lead us to entertain any exalted idea of Dutch honesty in the seventeenth century.

The entrance to a hall, he says, is not so proper in the middle as at the end, or, at all events, set as much as possible near the end. He urges that the principal floor of a building should not be level with the ground; he then introduces "his story of one in authority, who, passing by a town wherein the people generally did not outlive their thirtieth year, caused all the backs of their houses to be made the front, and the windows which were forward to be made up, to free them from that infectious aire that did shorten their lives, which had its effect accordingly, and it is therefore I do so much insist on the point of placing a building where good aire is, and that neither chimneys nor doors may be so placed as to serve for the attraction of infectious aire, which kills more than the sword, or the sea overturnes ships." A truth which, although uttered in 1663, we seem now only just beginning to perceive the importance of.

The book closes with some desultory remarks of no great importance as to the choice of clerks of works and surveyors, from which I need only quote the following portion:—

Let all owners [of houses he means] be prepared to *repent*, whether they build or *not*, for it is like the fate of many who marry, or marry not. Let both the one and the other lay, as in a scale, their several charges, vexations, cares, labours, and pleasures; they will find this to be true, viz., if they build they must be at great present disbursements, vext with as many oversights, and to be over-reach'd in bargains concerning their materials. If they build *not*, they are subject to the inconvenience of houses built according to the fancies of [other] owners; and when they shall cast up the summs of money spent in the rent, besides many chargeable alterations, they shall finde that they might have built better and more fit habitation for them and their posterity.

LEGAL.

Queen's Bench Division.—Light and Air Case.

(Before Mr. Justice Denman.)

Skivens *v.* Clements, Jeakes & Co.

The plaintiff in this case kept a common lodging-house in Macklin Street, Drury Lane. The defendants are the well-known firm of engineers, and occupy adjoining premises. Defendants had lately raised the end of one of their buildings, and plaintiff alleged that the new portion of the structure obstructed the light and air flowing laterally into the ancient back windows of his premises, of which he held a lease, the unexpired term of which was five and a half years. He also complained that a small stable had been slightly narrowed by replacing a wood enclosure in brick, and that a pier or buttress had been built a few inches over the boundary of his yard. For these matters he claimed several hundred pounds damages, and in addition prayed the court to grant an injunction to compel the defendants to pull down the offending portions of their new building. A number of men who habitually used the plaintiff's lodging-house were called on his behalf, as was also Mr. Sewell, architect, and Mr. Harper, surveyor, who all deposed to there being less light and air, especially in the common kitchen, since defendant's new building had been put up.

The defence was that the plaintiff had suffered no damage to his light and that no trespass had been committed. In support of this view, evidence was given by Mr. Harston (A. and C. Harston), architect, and it was stated that Mr. Banister Fletcher concurred, and would have been called, but that being a candidate for the renewal of Parliamentary honours his presence was required in Wiltshire. The case was contested at great length (occupying three days) by Mr. Channell, Q.C., and Mr. Davis on the part of the plaintiff, and Mr. Lumley Smith, Q.C., and Mr. Mitchell, instructed by Messrs. Lee & Pemberton, solicitors, for the defendants. The Judge requested the jury, if they found any damages, to award a separate sum for each item of complaint, which they did as follows, viz., damage for loss of light and air, 5*l.*; damage for trespass by piers, 5*l.*; damage to stable, 3*l.*; ditto to tank, 1*l.*; total, 14*l.*

Defendants had paid 25*l.* into court. The Judge observed that this was a verdict for *defendants*, but afterwards proceeding to give judgment for 14*l.* for *plaintiff*, defendants' counsel objected to that course, and it was ultimately decided that the verdict of the jury should be recorded, but the judge would give no judgment; either party could, if they considered it worth their while, move the divisional court for judgment. He, however, refused the application for an injunction to pull down. The result is that plaintiff cannot get the 14*l.* awarded to him, nor can defendant get out of court the balance between the 14*l.* verdict and the 25*l.* paid in, except by the expense of moving the Queen's Bench Division of the High Court; nor, until such motion be disposed of, can any decision be arrived at in respect of the more important question of costs.

CHURCH BUILDING AND RESTORATION.

Hythe.—The plans of Mr. Pearson, R.A., for the restoration of the chancel of the parish church have been received. In his report he says:—"The improvement in the internal effect when the restoration is completed will be almost inconceivable." Mr. Pearson has divided the work into sections: (1) the completion of the groining of the chancel and its aisles, and the reparation of the roof and parapets; (2) the repairs to the stonework outside; (3) works in the crypt, and the opening of a newly-discovered door; (4) the reflooring of the chancel, and the completion of the whole work internally. Two tenders have been received. By the lowest, the first section of the work would be executed for 1,696*l.*, and the whole four sections for 2,414*l.* Towards this nearly 1,000*l.* is promised. The committee say they dare not accept the responsibility of giving the order for the work until they receive further contributions.

NEW BUILDINGS.

Topsham Vestry Hall.—The tender of Mr. Perriam has been accepted for this building, for which the plans were prepared by Mr. E. H. Harbottle of Exeter. The style is Queen Anne, and red brick will be used for the walls. The building will contain two spacious rooms, one on the street level and the other forming the first storey, and both will have separate entrances from the outside thoroughfare. Folding doors will divide the basement room, and both apartments will be lighted at each end by large circular-headed windows.

GENERAL.

Mr. T. Brock, A.R.A., has been elected an Honorary Member of the North-Western Literary and Historical Society, Sioux City, Iowa. A letter from the secretary to the society intimates that in electing Mr. Brock the members are desirous of conveying to him an expression of their recognition of his rare artistic genius and their appreciation of his great sculptures.

M. Marquet de Vasselot has received the Cross of a Chevalier of the Legion of Honour from the Minister of Fine Arts in recognition of the value of his statue of Lamartine.

A Lady has offered to purchase 42 acres of land for the formation of a public park at Ipswich.

Mr. R. Berrington, assistant borough surveyor of Wolverhampton, has been recommended to the Town Council as borough surveyor in succession to Mr. G. E. Thoms, who resigned the office.

The Monumental Railway Station at Bruges, which was built in the Gothic style to harmonise with the rest of the old Flemish city, was opened on Sunday.

The Members of the Winchester House Company (Limited) resolved on Monday to sell the freehold of the land to the Ecclesiastical Commissioners for the sum of 487,500*l.*

The Foundation-stone of the Finsbury and Shoreditch Polytechnic was laid by Princess Christian, in the presence of the Lord Mayor and Sheriffs of the City of London, on Saturday last. Mr. Henry W. Dobb, the architect, and Mr. Mollett, the builder, had the honour of being presented to the Princess.

The Music Hall in Dublin, which is in course of erection from the plans of Mr. C. J. Phipps, F.S.A., is to be opened in November.

The Parish Church of All Saints, Leighton Buzzard, which has been restored by Messrs. Bodley & Garner, has now been reopened.

The Shrewsbury Town Council on Monday proposed a scheme of improved water-supply, which is estimated to cost 25,675*l.*

The Foundation-stone of a church at Woodford, of Norman Transitional style, designed by Mr. James Fowler, of Louth, was laid last Friday.

The Penge Vestry have decided to purchase a large piece of land at Penge for the purpose of a recreation ground, which will cost about 4,000*l.*

The Congregation of St. James's Church, Edgbaston, Birmingham, at a meeting lately held, decided to build an organ chamber and choir vestry to the church, and over 400*l.* was promised in the room towards the cost.

A Committee has been formed to take steps for building a chancel and other improvements to Illingworth Church, Ovenden, the cost of which is estimated by Mr. W. S. Barber, architect, of Halifax, to be about 2,000*l.*

The Architect.

THE WEEK.

The Committee who are making the toilsome experiment of introducing technical education to Dublin have become the occupants of extensive premises in Kevin Street. The building is one of the large mansions which survive from the last century, and have become more remarkable from the squalid houses near them. There is much yet left in the city to reward the research of a follower of Queen Anne. Kevin Street is in one of the poorest districts, but the building on that account was obtained very cheaply, and it can be converted into a technical school at a moderate outlay. An application is to be made to the Science and Art Department for as generous a building grant as is to be obtained. We hope that the appeal will not be set aside because some unimportant official regulation has not been observed. If it be objected that the building is not new nor specially planned, the peculiar conditions of the case should be also considered. This is not the first educational attempt in an adapted building. The Dublin Society, which has done good work, has long utilised a house built for the Duke of Leinster. The Catholic University occupies private houses. The Royal College of Science was also a private house. With so many precedents, it would be an unworthy course to refuse a grant to the Technical School. The Committee of the school have undertaken an arduous task, and it is, moreover, one for which there are no precedents to give them encouragement. They are consequently deserving of all the support which the Science and Art Department can afford. But the rule which prescribes official teachers cannot be rigidly enforced if the school is to be successful. Practical men are needed. If, for example, Mr. Wigham could superintend a class, he would be worth a legion of the certificated teachers who know so little about workshop practice.

The decree relating to the organisation of the French International Exhibition of 1889 was announced on Monday last. The date fixed for commencing the works is September 1, and in consequence a very short time is allowed for the preliminary arrangements. The iron tower is to be undertaken as an important part of the scheme.

Mr. Swain, the clerk of works at the Truro Cathedral, can congratulate himself on the success of his appeal to the public for funds towards the erection of the lantern stage of the central tower. The sum of 1,831*l.* was obtained, and, although 1,043*l.* is still required, the order to commence the work has been given. But a work of the kind ought not to depend on occasional bursts of benevolence. The interest which attaches to the experiment of constructing a new English cathedral should be enough to attract supporters.

The Albert Hall, like the Crystal Palace, is an illustration of the consequences of believing that the public are sufficiently good-natured to enjoy any kind of pleasure which is put before them. Probably not one in a thousand of the visitors to Sydenham care to understand the costly architectural courts or the history of the sculpture. The lovers of high-class music allow the Albert Hall to be loaded with an increased debt every year of about 2,500*l.* It is supposed that the only way to make ends meet will be, first, to get rid of the privileges possessed by the holders of seats—that is, of occupying the places for which they paid a good deal of money; and secondly, to allow entertainments to be held in the hall of a more popular character than was contemplated when the shares were subscribed for under the influence of hero-worship. It is evident that many of the seat-holders believe that some revolution of the kind must be gone through. The owners of 544 seats are in favour of a change, while opposition is represented by the owners of 114 seats. The success of the concerts held in the adjoining grounds of late years is enough to demonstrate that the public can patronise music when it is of a really enjoyable kind. The Albert Hall performances were characterless. The hall itself was supposed to form the attraction. The building is not adapted for concerts like those which Mr. Chappell produces at St. James's Hall, and, in spite of all that is said by officials and their flatterers, it is not good for sound. The building is better adapted for a circus than for a music-hall, and it seems likely that it may be changed into something of the sort. The frieze which surrounds the exterior could not then be more out of place than it is at present, for it is a mockery to suggest that a building managed as this has been could have a connection with the history of art. The Albert Hall resembles a good many of the South Kensington schemes. Unfortunately there was no exchequer to cover the losses, and therefore it has to be proclaimed a failure.

It is too often taken for granted that architectural sculptors are only competent to deal with forms that are more or less conventional. The bust of *Mr. J. J. Griffiths*, by Mr. Mabey, of Westminster, which is in the Royal Academy, is enough to refute the belief as regards one artist who is a representative man in his profession. This bust has striking qualities, and might be acknowledged by members of the Academy. It is gratifying to find that Mr. Mabey is willing to attack work of the kind, and his success is a guarantee that his sculpture for buildings will not be of the stereotyped kind that is sometimes seen, and which will not sustain the test of a comparison with nature. Next year we hope Mr. Mabey will be represented by a larger work in Burlington House.

The new number of *L'Art* contains two plates which were exhibited in this year's Salon. One is a lithograph, designed by M. Fantin-Latour, *Lohengrin*, and represents the scene where the Knight of the Holy Graal asks the Princess Elsa whether she will marry him after the combat he undertakes to assert her innocence, and without any questions about his past life, his name, or lineage. M. Fantin-Latour is original in his methods. In this case he would seem to have tried the experiment of chalking over the stone—or at least the part filled by the two figures—with deep black, and afterwards bringing out the gradations and lights by scraping. The plate has the appearance of a drawing with charcoal, and is worthy of the attention of artists. The etching by M. Giroux, after M. Chartran's picture, *Apparition à Saint François d'Assise*, is one of those elaborate works which are only to be found in *L'Art*. The expense of producing them would be too much for any other periodical. The subject is taken from one of the Franciscan legends, and represents a vision which was seen in a barn. Among the articles which are illustrated, we may mention one on the Salon by M. Paul Leroi, which is outspoken in its exposure of the shortcomings of those who are entrusted with the control of the exhibitions, and courageous in departing from the selection which custom appears to enjoin to art critics in Paris.

It is supposed that the Cockburn Association is rather favourable to a restoration of Holyrood Chapel, but if the words of Lord Moncrieff, who was chairman at the last annual meeting, are of any account, it is evident there is not unanimity among the members on the subject. His lordship said it was not intended to express in the report any opinion upon restoration except this, that a relic so interesting to the whole nation ought to be at all events preserved as far as it could be in its existent state, and if any operations were to be carried out with the purpose of restoration, that these should be conducted with the greatest care and attention. His lordship's opinion was, that while preservation of course was exceedingly desirable, restoration was not possible. From all that he heard, he believed that architecturally there would be difficulties in the way, and he was not sure that it was not better as it stood, and a better memorial of the past, than any restoration could make it. In this opinion architects will agree. The ruin is impressive at present, but if it were transformed into a royal chapel the charm would be gone. There is a temptation to a wealthy merchant to have his name associated with Holyrood. We hope the good sense of the Cockburn Association will not encourage any desire of that kind, and the people would be certain to oppose it.

ROMANO-BRITISH MOSAIC PAVEMENTS.*

THE name of Mr. THOMAS MORGAN is well known in connection with archæological societies, and it is to be regretted he does not more often give the world the fruits of his lore in volumes resembling one on Romano-British Mosaic Pavements by him, which has lately appeared. The public in England have few opportunities of becoming acquainted with what has been done of late by native archæologists, and are therefore unaware of the system with which inquiries are conducted. Plausible theories have little chance nowadays in any archæological society; very severe tests are applied to everything which is brought forward, and the proceedings in general will, for method at least, bear a comparison with those of societies which are professedly scientific and unimaginative. But how can the public realise what is done at a meeting which is attended by few and of which no report reaches a newspaper? England is not alone in this respect. The French archæologists get through good work also, which is unknown to the mass of their countrymen, and for which they receive scant credit. Both countries possess massive volumes which represent the transactions of the societies, but the form in which they appear is a guarantee that the pages will be read by few.

How many people in England know the number of mosaic pavements which have been found in the country or could describe their character? That there are memorials of Roman occupation is assumed, and they may be in the form of mosaics, as in any other. But even educated Englishmen never give a thought to the subject; and if by chance they see a specimen they are likely to consider that the admiration bestowed on the mosaics is hardly warranted. The Romano-British pavements may not have as fine contours for the figures nor as graceful ornament as is to be obtained now, for there is no use in overpraising antiquity; still, as illustrations of mythology and as memorials of foreign occupation, they claim a high degree of interest. Moreover, the study of them brings us into relation with many aspects of Roman life and thought.

The Romans seem at one time to have attached as much importance to a floor with patterns as their successors did to a pictorial ceiling a few centuries ago. When we read that among the *impedimenta* of JULIUS CÆSAR were tesseræ and sectilia—which some French translators interpret as *bois de marqueterie*—to be used to floor the headquarters in his invasions, there seems to be something more than luxury in the use of mosaic pavements. Was it the habit to peruse the patterns when thinking? The character of the subjects mostly represented in the British examples will suggest that it was tacitly accepted that certain things were more eligible than others :—

It will be found (says Mr. Morgan) that the subjects most frequently repeated are :—*Orpheus with his Lyre* taming the animals, as at Woodchester, Withington, Barton Farm, Winterton, Horkston, Littlecote (Wilts), Chedworth, Cirencester, and Morton (Isle of Wight). *Bacchus and Panther*, as at Cirencester, Pitney, Thruxton, Stansfield, Bignor, and London; and, without his panther, at Frampton. His *Cantharus* at Bignor, Cotterstock, Littlecote, Crondall (near Farnham), Lee (near Shrewsbury), Itchen Abbas, Bramdean, Stansfield, Carisbrook, Silchester, Morton (Isle of Wight). *Harmonia* once, at Morton. *The Seasons of the Year*, at Littlecote, Thruxton, Morton; and at the latter place *The Seasons of the Day* also. *The Realms of Neptune*, with his naiads, tritons, dolphins, and fishes, at Withington, Cirencester, Bramdean, Bignor, Frampton, Horkston, Woodchester, and Littlecote. *The Enemies of Bacchus*, as Lycurgus with his axe; Pentheus, whose head is held up by Agave, his mother; and the head itself in the head of another compartment, at Morton. The angry *Juno* is there represented in her interview with Lycurgus, armed with the axe; and she appears also through her emblem, the Peacock, at Wellow, London, and Morton, where also are depicted her winged messengers, or Iris, sent to proclaim war against Bacchus, unless these are meant for the Winds. *Mercury* is shown five times at Frampton and once at Bramdean; the episode of the black king *Morrheus* and the nymph *Chalcomedia*, one of the Bassarids, at Morton. Another enemy of Bacchus is disposed of in the death of the Indian king, while a grandson of Cadmus, *Actæon*, son of his daughter Antonoe, fills up the tragic catastrophe which overwhelmed the family of Cadmus. The goddess *Isis* is only once drawn, and that is at Pitney, even if the figure should be really that divinity. *Cupid* is represented at Leicester, and is seen riding on the tail of a seahorse at Horkston. *Good Luck* was to be honoured, as at Woodchester.

Then there are scenes representative of occupations and amusements; winged gladiators are seen at Bignor, and in a few cases, where probably some staunch Conservatives resided, the old gods appear. The fret border is supposed by some to be more than a fanciful arrangement of straight lines, and to relate to fire-worship or to the legendary labyrinth. Astronomical, or rather astrological, instruments are figured in a mosaic at Morton. It will thus be seen that a certain high character was given to the subjects of the mosaics, and, indeed, the Roman was little disposed to unbend himself when he attempted to be artistic.

After a general dissertation on the subject, Mr. MORGAN describes at length the mosaics which were found in England, taking them in counties, and giving the first place to Gloucestershire, because the earliest mention of a Roman pavement by an English author relates to Woodchester in that county. In GIBSON'S *Camden* (1695), Woodchester was said to be "famous for its tesseraick work of painted beasts and flowers which appears in the churchyard two or three feet in making the graves." In the county are also the pavement at Chedworth, which Mr. GROVER describes as a very bright and beautiful mosaic, with an ingenious entwined border; one at Cirencester, and a fragment in the city of Gloucester. It is worthy of notice that the Romans appear to have utilised local materials to some extent, at least for their pavements. This is plain from the description of the Cirencester example given by Professor CHURCH :—

The materials (he says) used in the manufacture of the tessellæ appear to have been carefully selected, and many of them obtained from a considerable distance. The white tessellæ are from a singularly hard and pure limestone of the neighbourhood, the uppermost bed of the great oolite; the cream colour from the great oolite; the grey, the same stone altered by burning; the light yellow from the oolite; the chocolate from the old red sandstone; the slate, or dark colour, from the limestone of the lower lias; the brown are of Purbeck marble; while the light and dark red, the yellow and the black are of burnt clay, and the ruby red, glass. The last-mentioned colour is used for the flowers which adorn the head of the goddess Flora, and for the blood dropping from Actæon's wounds. The glass is coloured red by suboxide of copper, but by lapse of time it has acquired a green crust of carbonate.

When describing the mosaics at Bath, Mr. MORGAN makes use of the paper read by Mr. DAVIS, the architect to the Corporation, who has done more than any man in England for the exploration of Romano-British remains. But, strange to say, Bath, where so much Roman work exists, is not remarkable for its mosaics. Further research may, however, reveal important examples.

In London a good many specimens have been found. Mr. PRICE has watched over recent excavations with anxiety, and has been rewarded. Apart from the intrinsic value of the pavements, they are useful in helping us to determine the direction of streets and buildings.

The study of Romano-British remains might be expected to receive an impetus from the discovery of the villas in the Isle of Wight. The pavements at Morton Farm, near Brading, are very curious. It seems to us that here, as in many places, the design is better than the execution, and each may be no more than a copy from another work or a compilation from more than one. The figures are often well placed, but the contours are exceedingly stiff in every case, and sometimes there is the distortion that is seen in children's works. It is evident the artists had no notion of imitating nature.

It cannot be said that there is much for modern artists to learn from our Roman pavements. In the first place, as there was a limitation of materials, there is less effect in them than is now obtainable. The colour has, in general, a coldness that cannot be considered to be requisite for pavements. If there is no offence against æsthetics in having Eastern rugs to cover a floor, it cannot be a crime to lay down mosaics containing tesseræ of a rich colour. The illustrations of the mosaics brought from Halicarnassus which Mr. MORGAN gives are a commentary on the cold-

* *Romano-British Mosaic Pavements.* With Plates. By Thomas Morgan, F.S.A., &c. London: Whiting & Co.

ness which necessity imposed on the Roman artificers in Britain.

But, whatever may be their shortcomings as works of art, the worst of the mosaics which remain is interesting as historical evidence. We see how the antique Roman, like the modern Englishman, retained his native forms in his art-work, no matter how far he might travel from his capital. We see also that he tried to utilise the materials that were near him, when, unlike Cæsar, he could not bring his tesseræ from Italy. The buildings he erected here might externally differ from those in which he was reared, for they were sure to be adapted to the climate, but in the interior, and especially on the floors, he had much which recalled his native state. Certainly there is reason for the conservation by the State of what are left of those Romano-British pavements. Mr. Morgan's volume contains an ample description of each of them. He has given also elaborate plates of the principal examples. His book is entitled to be welcomed as a valuable addition to the literature of archæology.

IN THE COUNTRY OF THE FALISCANS.

[By a Correspondent.]

THE traveller who has journeyed from Rome to Florence, or *vice versâ*, will remember to have passed a roadside station about thirty miles from the former city, called Borghetto. Lying off from it is a small hamlet surmounted by a broken old castle, a conspicuous object in the valley of the Tiber, here spreading into an expansive plain, the river crossed by a serviceable stone bridge. It is here one enters the southern portion of that division of Italy formerly called Etruria, in this part the abode of the Faliscans, the formidable enemies of ancient Rome. A tour recently made in that region by the present writer in the companionship of a friend gives the opportunity of presenting a few notes of a country rarely travelled over by foreigners, rich in architectural and archæological interest, and offering to the artist many points of attraction.

Diverging from the railway at Borghetto, six or seven miles to the westward is reached the considerable town of Civita Castellana. It is entered by a fine stone viaduct, which carries the road over the deep ravine which almost surrounds it. The situation of the town is remarkable. It is in the midst of a volcanic country split into enormous rifts or gullies, sometimes extending for miles. On the borders of one of these, which almost environs it, the town stands, a position undoubtedly chosen in ancient times for its security. It is supposed to occupy the site of the most considerable of the twelve cities which constituted the stronghold of Etruscan power. It was brought into subjection to Rome soon after the conquest of Veii. It is most picturesquely situated, the houses looking down into the gorge of Plutonic origin, through which a small stream flows, turning several mills in its course. One side of the town is flanked by an enormous fortress built by Sangallo for Alexander VI. in 1500. The cathedral is Gothic in character, dating from 1210. The church has been altogether modified and restored, leaving nothing of the original structure but the portico, the doorway, the floor, and the crypt. The doorway is flanked by double columns supported by lions. The abutting portico is a charming specimen of the mosaic work of the Cosimati Brothers, those fine artists in mosaic work of the thirteenth century, whose name it bears, together with the date of the building. A mosaic frieze, with the head of the Saviour, is seen over the side door. The mosaics are now under repair. The floor of the church is perhaps one of the most beautiful existing in this kind of work, rivalling that of Santa Maria Maggiore, in Rome. Precious as jewellery, this fine work, which is worthy of the most careful preservation, is so covered with dirt that the designs are scarcely traceable on it. There is not much beyond a general picturesqueness to detain the traveller in the town, but around are to be seen many remarkable Etruscan remains. Many parts of the most ancient walls are still standing, built in enormous blocks of the volcanic peperino of the neighbourhood, without mortar, in alternate courses, lengthwise and endwise, as was the custom of the Etruscan people. Tombs and houses are to be seen in abundance cut into the rock, some supported with columns left in stone, some with recesses at their sides, as of a columbarium. The Italian Government is now occupied in making excavations from which important results may be expected.

Eight miles from Civita Castellana is the town of Nepi. It is reached by a road traversing a plain studded with chestnuts, always in sight of the Ciminian slopes. It was the Nepete of the ancient Romans, and in very early times was in alliance with the Roman power against its Etruscan neighbours. Many remains of the most ancient walls are still to be seen, which may very well be the same as those stormed by the Romans in the fourth century, B.C. Its bishopric is said to have been established in the early half of the first century. The first cathedral was built about the year 400, on an ancient temple of Jupiter, for the reception of the body of San Romano from the catacombs. In the thirteenth century the town was taken by Frederick II. It was burnt and almost destroyed by the French in 1799. So far, however, has modern civilisation and the interests of the time now forgotten it and its untravelled neighbourhood, that one wonders that anyone should at any time have thought it worth while to invade its insignificance. At one side of the town is a most picturesque group of objects. An old Mediæval castle arises, consisting of a tall round tower and a lower square one, with broken ruins beneath. Below these towers is the gate of the town, reached by a bridge spanning a stream of water which makes a picturesque cascade. In the ravine into which this falls an old-fashioned water-mill finds place, with its rumbling hoppers and mealy atmosphere. Such a scene lit by a weird half moon might have furnished a picture for one of Mrs. Radcliffe's romances.

At a distance of nine miles from Nepi, Sutri is reached. The neighbourhood of this little town abounds in Etruscan remains. It was the Sutrium of the Romans, being one of their early conquests in Etruria. It is approached by a road excavated in the tawny-coloured tufaceous rock, whose sides are excavated with tombs sometimes in single, sometimes in double file. Some of these have been converted into refuges or chapels of the Early Christians, and in one place is a considerable excavation, consisting probably of several of these tombs opened the one into the other, which has taken the form of a rude church or cathedral. It has a vaulted roof, a nave, aisles and an apse, the nave being separated from the aisles by rows of square columns left in the excavation. The interior was plastered and decorated in the fourteenth century. The most remarkable, however, of the remains of ancient times is that of a spacious amphitheatre cut out of the solid tufa. In a few places it is eked out by a little masonry, otherwise the whole amphitheatre is an excavation. It has been conjectured that it may have been adapted from a stone quarry, which is very possible. There are four vomitorii and a stairway up to the adjoining villa. Nibby believes the amphitheatre to be of the time of Augustus, but it may possibly have been much earlier. It is a very interesting relic of the past.

The cathedral of the town has lost the character of its earlier structure in subsequent restorations. It is a pity that the Catholic Church, so conservative in its forms of faith, should be so indifferent to the preservation of its monuments. Surely it must have been obvious at every age that stone is better than stucco, that sculpture and mosaic are a finer order of material than tawdry marble veneering and bad distemper painting. The mosaic floor, however, still remains of exquisite design and workmanship, but, as in the former case, so obscured by dirt as to be scarcely visible. The crypt of this church is remarkable. It consists of a vaulted roof supported by many columns, the capitals of which are sculptured in ornament or grotesque in varied design, some of them more highly finished than others. The same kind of substructure is found also beneath the cathedral church of Civita Castellana and that of Nepi.

From this place the road descends below the old brown houses of the town, and follows the bottom of one of the enormous fissures, the result of geologic disturbance, which is the distinctive feature of this part of Italy. A cineracious tufa is the prevailing formation, but sometimes an aqueous deposition is seen with breccias and marl, all extremely

friable when exposed to the action of the air. Travelling along this valley, we are met by the soft breath of spring breezes, accompanied by the songs of many birds—nightingales amongst the number. A little brook flows by the roadside, its sides prettily bordered by the yellow iris flag. The drive is an inspiriting one. Soon we emerge from the ravine, and there arises upon the left an old town, untouched since the Middle Ages, called Capranica, here and there supported on blind arches built against the rock. It is worth a visit. There are the remains of an old church in a fine portal of Lombard construction, the upper part sculptured with a kind of arabesque of a very quaint and interesting character. In a chapel of the cathedral there is also a noteworthy tomb of early fifteenth-century workmanship.

Journeying onwards we reach the somewhat important town Ronciglione. It consists of two parts—one modern, clean-looking, cheerful; the other grimy, with unglazed windows, forbidding, roof above roof, with the usual Mediæval castle frowning in the midst. It seems once to have appertained to the Farnesi. Some ironworks, in which ore brought from Bracciano is worked, give a little movement and energy to the place. Its romantic situation on the edge of one of the volcanic gorges, and a certain gloomy picturesqueness which appertains to the older portion of the town, afford interesting material for the artist's sketch book.

From this town the road takes us into the heart of the Ciminian range of hills, the mysterious region which had so many terrors for the ancient Roman and his foe. Still some part of the old forest remains. We skirt the lake, Ciminius of the ancients, now Lake Vico. It lies smooth and bright in the morning light, but the hills amongst which it is situated, as if to retain their ancient character of solemn mystery, are robed in folded clouds which brood almost upon the surface of the water. Winding by field and farm and wood we arrive at the small town of Caprarola, situated on a slope of Monte Cimino, hardly interesting in itself, only for an architectural curiosity which may well detain us a short while to examine its particular features. It is a mansion or castle—for it partakes also of the nature of a stronghold—built by Vignola, and accounted his masterpiece in construction. Interesting it certainly is, but it could hardly be said to furnish any suggestion, either architectural or decorative, for a residence in more northerly climes. The mansion was built for Alessandro Farnese, nephew of Paul III. It is of pentagonal form, surrounded with bastions and a fosse. The façade is imposing. Its two tiers of windows with a blank course above overlook the length of the main street of the town and the far Campagna of Rome. The view seen from the balcony of the second storey is one which the mind delights to dwell upon, and does not lightly forget. The area of the interior is circular, the building rising from a subterranean chamber hewn out of the solid rock. From this a spiral stone staircase with balustrades leads to the upper storeys, the suites of chambers giving off from it. The cortile is adorned with a good deal of decorative work in distemper, by Antonio Tempesta, consisting chiefly of birds and flowers supported by a trellis. On the first floor is the Chamber of Maps, with the constellations with their mythical forms substantially modelled out in colour by the Zuccheri Brothers. The Sala Regia is ornamented by a marble fountain at one end of it, embellished with a kind of encrusted mosaic work, adjoining which is a circular chapel with wall-paintings. Another chamber decorated by the above-named painters is the Camera della Storia Farnesiana, wherein the principal historical events in which this family was concerned are depicted upon the walls. These, together with the Room of the Council of Trent, embrace the principal features of the interior. Seen from the windows of one of these rooms an elaborately-kept Italian garden stretches away uphill.

Leaving this quaint out-of-the-world quarter, the road lies along quietly sloping hill-terraces, through what remains of the old forest, to a very remarkable locality. It is that of the old Roman city Fallerii, founded on the ancient Etruscan city of a similar name, and colonised by the Romans on its subjugation, as was their custom. The buildings of the city have almost vanished; but the walls, which are of semi-Etruscan construction in the volcanic stone of the district, are left standing in almost their whole circuit—everywhere traceable, and in some places nearly perfect. One of the gateways, called the Porta di Giove, from a head sculptured on the keystone, has received very little damage from the usage of time. Another, called the Porta del Bove, from the head of an ox on the keystone, still remains tolerably perfect. Here the walls reach a height of 54 feet, some of the stones of which they are built measuring 6 feet in length and 2 feet in depth. Square towers appear at intervals along these walls built for the purpose of defence. Near the Porta di Giove is the former abbey of Santa Maria, which is—what remains of it—a good example of twelfth-century workmanship in the Lombard style. Its nave and aisles are divided with columns taken from the vanished city of antique times, some of them very beautiful. The doorway is a delightful specimen of light and graceful architectural proportion. It is the work of the Brothers Cosimati, the celebrated architects and mosaic workers of the thirteenth century, above spoken of.

An ascent of Soracte, the famous mountain of ancient days—neither difficult nor laborious—fitly concluded an interesting journey, in the course of which were still to be seen so many traces of a vanished civilisation. It is now surmounted by a monastery and a chapel. The views from the top of this mountain which rises isolated from the plain like "a wave about to break," as Byron not unhappily says, are very fine. Thirty-five miles away the dome of St. Peter is faintly seen, though the whole city which it dignifies has vanished. Perhaps in the future all this may be opened up as a pleasant round for tourists. At present its want of the means of communication with the modern world, and the absence of decent accommodation for travellers, make its exploration inconvenient in some degree.

THE LATE ÉMILE PERRIN.

It is the custom for a newly-elected member of the French Academy of Fine Arts to deliver a discourse on his predecessor in the chair. In this way it fell to the lot of the Baron Alphonse de Rothschild to become the eulogist of the late Emile Perrin, the painter, who was almost universally known from his direction of the Opéra Comique, the Opéra, and the Comédie Française. The principal passages in the remarkable discourse have been printed in the *Courrier de l'Art*, and we give a translation of them. One circumstance deserves to be recorded. It will be seen that M. Perrin expressed his admiration of Cambon, the scene-painter, and he intended to have written an essay on the artist in *L'Art*, but he died before he was able to fulfil his promise.

Emile Perrin, said Baron Alphonse Rothschild, was born in Rouen on January 19th, 1814. His father being a councillor to the Court of Appeal at Caen, Emile would hardly seem to be destined to follow art as a career; but, once his early studies were completed, his taste led him to painting. On coming to Paris, he entered at first in the *atelier* of Gros, and subsequently into Paul Delaroche's. A water-colour by him was seen in the Salon of 1841. But even at that time the practice of art did not absorb all his faculties: Perrin was also an art critic. It was in this dual aspect of exhibitor and of critic that for some years he took a share in the artistic life of the time. His articles on the Salon which appeared in the *Moniteur Parisien*, the *Nouveau Correspondant*, and the *Union Catholique* are evidence of his rectitude of judgment and of his talent as a writer. His picture of Pierre Corneille and the cobbler received a great deal of attention. Théophile Gautier devoted an article to it in the *Presse*, praising the harmony of effect, the finish of the detail, and pointing out the qualities which announced that the author was a painter of a high value. The picture well merited the honour of being purchased by the State, and it is now in the Musée of Caen. M. Perrin made it a point of seeking dramatic subjects for his pictures, and the skill of the future director was indicated by his mode of arranging the figures and by his attention to costume and surroundings.

One is, however, never master of his destiny. The ambition of M. Perrin was to make a name among painters, and at the very moment when he seemed to be on the point of attaining that end, certain events occurred which turned his activity into a new course, and gave him an opportunity to display that versatility which characterises the intelligence of a select few. In February 1848 there was the Revolution, and in May the Opéra Comique was in a state of bankruptcy. M. Ledru Rollin was then Minister, and he was inspired with the idea of giving the direction to a painter. However original might be the idea, the office was not attractive. Perrin did not hesitate about accepting the appointment, and resolutely took possession of the director's chair. He had confidence in him-

self, and the result showed it was not misplaced. No one could so well render homage to the skill which he displayed in the delicate functions of his office, than the eminent artists with whom he was then brought into relation: some were associated with him, but all remained his friends. They alone could do justice to his tact and firmness, to the variety of his knowledge about artistic and literary matters, and, if the word is not over-ambitious, to the diplomatic qualities which are requisite for every successful director of a theatre. For more than forty years M. Perrin was administrator of the three greatest among Parisian theatres—the Opéra Comique, the Opéra, and the Théâtre Français. In each case it was plain that he was equal to the duty. During so long a period, with how many ministers, under-secretaries, and officials of every kind, of all shades of political opinion, must he have transacted business? with how many singers and actors, equally representative with the poets of the *genus irritabile vatum*, although they were the first artists in the world, was he obliged to deal? He faced all difficulties. He was slow in coming to a determination, but when once taken he never recoiled in face of any responsibility, and never faltered in any duty. He possessed a tender heart as well as a strong head. Under an exterior that seemed rather frigid he concealed a heart that was open to his friends as well as to his family. He knew how to make his authority beloved and respected.

When he entered on the Opéra Comique it was about to be closed. In the course of a few months he restored its fortunes. The stage which was deserted and abandoned regained its brilliancy with the aid of composers such as Victor Massé, Meyerbeer, Grisar, Halévy, Reber, Ambrose Thomas; interpreters like Mmes. Miolan, Ugalde, Lefebvre, MM. Bataille, Faure, and Puget; and pieces of the class of the "Val d'Andorre," the "Chanteuse Voilée," the "Songe d'une Nuit d'Eté," and the "Etoile du Nord." When in 1857 M. Perrin quitted the direction of the Opéra Comique, the theatre was in a prosperous state. From that time his reputation as a director was established.

He said he wanted repose, and he sought it in a new kind of work. From 1857 until 1862 he proved himself to be a writer with the happiest powers. He possessed a style that was at once sober, subtle, and elegant, while his thoughts were marked by precision and elevation. His articles on art and the theatre in the *Revue Européenne* were well appreciated. He was able to hail young composers who then started, and have since been recognised as masters. It was his good fortune to be one of the earliest to proclaim the success of "Faust" at the Théâtre Lyrique, that masterly work which is the result of a marvellous association of musical genius with literary genius. Literary work was not sufficient to absorb all his activity. He again turned to painting, and produced his *Messe de Plombières*; it is probably the best of his works, and now decorates the chapel at Plombières.

The retirement of M. Perrin had been fatal to the Opéra Comique, and he was solicited to resume the direction. He had only time to put the house in order, and to make it once more fashionable, for soon afterwards he accepted the administration of the Opéra. As a brave man he was fascinated by the peril. Where so many succumbed he was able to be successful, owing to his energy, and to that combination of qualities which made him eminent in many things. The task was, however, trying, but he went through it with honour.

Among the pieces which he brought out I can cite but a few in order to illustrate his tenure of the direction. One was "L'Africaine" of Meyerbeer, which has been wittily described as a phantom opera, for while it is spoken about it is never seen; another was the "Hamlet" of Ambrose Thomas, which is one of the masterpieces of the lyric stage of France; a third was the "Faust" of Gounod; and a fourth was the delightful ballet by M. Délèbes, "Coppelia."

His career as a director of theatres was crowned in 1871, when he was appointed to the Maison de Molière, the Théâtre Français. From the first he was at home in it, and the intimacy of his relations with our foremost dramatists suggests in what esteem he was held by them. The fortunes of the theatre had suffered from the trouble of the time. His intelligent authority was not long exercised before some effect was produced. An incomparable troupe of players seconded his efforts, and under his auspices the Théâtre Français became once more the first theatre of the world. He was also able to attract the highest classes of the public by offering a refined pleasure.

But art remained his dominant passion, and no pre-occupation could turn him from it. He wished to make art co-operate in the success of the plays he mounted, and therefore gave special attention to the accuracy of costume and the perfection of the scenery. In this way he excited an ardent controversy, which was long resounding in the journals. It is worthy to be recalled. The debate was not a mere dispute over words, it involved higher issues, and as it became a question of principle, the Académie des Beaux-Arts could not remain indifferent.

An eminent critic, who wielded an incontestable authority, attacked M. Perrin in a series of articles. I regret I cannot reproduce them in their entirety. He said that M. Perrin was an artist rather than a philosopher. Was that a reproach? It could not be better addressed than to a member of this Academy. "But," he continued, "it is not merely on the detail of things that I disagree with M. Perrin, it is upon the very foundation of them. The difference arises from the fact that the two of us have ideas of dramatic art that are unlike. M. Perrin upholds the school of naturalism, whilst I am an idealist."

The naturalist desires that nature be faithfully reproduced, even to the smallest details, by the aid of all the processes which modern science has put at the disposal of managers; he considers the perfection which is now possible in the art of decoration as a great gain for dramatic art, and he regrets that certain difficulties render impossible a more literal translation of realism.

The idealist, on the other hand, admits voluntarily that all decoration, all scenic display, is an inutility, that progress in the art of decoration means decline, and that in seeking perfection of that kind the theatre is oblivious of its destiny and is returning to barbarism. It is very evident, however, that the two opposing opinions, when pushed to the end, are equally false.

M. Perrin intellectually respected scale and measure, and he was above all a man of taste. It was most unlikely that he could fall into the exaggerations with which he was reproached. Under the form of a letter, which was a veritable treatise on the subject, and is his most remarkable literary essay, M. Perrin replied to his critics, and formulated the principles of the *mise-en-scène*.

"The *mise-en-scène*," he wrote, "is a question of tact and of measure. It is true they are rare and precious qualities, which are not out of place on other stages besides those illuminated by the footlights. Every theatre in proportion to its quality and size is bound to satisfy the taste of the public. Costume comes very close to art—or rather it is a special kind of art which has been greatly vulgarised during some years. The *mise-en-scène* should hold a secondary place; the law of harmony should be its rule and its limit. It should resemble those amiable hostesses whose hospitality is so sweet that one quits their houses with regret, and with the desire to return."

M. Perrin retraced the history of the Comédie Française from the time when, under the title of Comédiens de Monsieur, Molière's arrived in Paris, and obtained, through the royal munificence, the Salle du Petit Bourbon. He displayed the transformation which taste underwent since that time. What would the patrons of the Théâtre Français say if they saw to-day Cinna or Orestes enter on the stage wearing the long perruque that was the fashion under Louis XIV. or the powdered wig of the time of Louis XV.? Must the plays of the great Corneille or of Molière lose some of their interest when they are represented under favourable conditions, with costumes of the time, and surroundings that are appropriate to the place and circumstances in which the action is developed? M. Perrin did not think so, and the public agreed with him. He took the greatest pains in mounting his plays, occupied himself with the most trifling details, designed the dresses with his own hand, and aided the scene-painters with his counsels. The painters who acquired celebrity under him were Larmier, Thierry, Deplechin, and Cambon; he was able to appreciate them, and spoke of them with sincere admiration. What a combination of efforts, talents, studies from nature, invention, science, is needed to paint one of those scenes, which is destined to produce the illusion of a moment and then to disappear without leaving any trace except fleeting remembrance in the minds of the people who were present! It was this feeling which was expressed in the eulogium which M. Perrin delivered at the grave of Cambon.

"We lose in him," he said, "the last and the bravest of that pleiad of artists who imparted to scenic work so much vigour that it has reached a point where it seems to contend with nature in precision, justness, and relief, as well as in proportion. Like the old masters of the great schools of Italy, who neglected no branch of art, a scene painter must be an architect, a geometrician, and a landscapist. Cambon possessed those qualifications. Nobody could have more of sentiment, of a genius for everything, of the power of divining the character of different periods and different countries. To this science of realism he joined a fertility without parallel, and a surprising power of imagination. If we could bring together the work that Cambon produced, the drawings which came from his hand, the conceptions of his indefatigable imagination, we should find before us a mass that would excel all that was done by Lepaute, Bibiena, or Piranesi."

People said that M. Perrin was a lucky man, everything succeeded with him. But constant success is not a simple result of accident. It only comes to the able, to those who by their perseverance, labour, intelligence, can control fortune and retain her. He was fortunate, but his happiness was for a

time incomplete. The favour which was his highest ambition, that which he regarded as a crown of a life of labour, as the coveted recompense of services rendered to art under all its forms, was accorded to him by the Académie des Beaux-Arts. The day of his election was esteemed by him a day of glory. It does not belong to me to speak of the position he held in the Academy. His whole life had been consecrated to the arts; he was penetrated with that love of art which is one of the most powerful motives of humanity, elevating it to the heavens in the pursuit of an ideal perfection.

Nothing was wanting to his life, neither noble aspirations, nor dignity of character, nor merited honours. He will thus be for the young and ambitious an example and an encouragement. They can learn from his career that the future reserves its highest favours for the men whose talents are sustained by labour and a strong will. M. Perrin has merited much from the arts, and therefore a souvenir of him will always remain in the Académie des Beaux-Arts and be associated with the names of our dramatic and lyric worthies.

TESSERÆ.

William of Wykeham.

C. R. COCKERELL, R.A.

THE chief expression of Wykeham's architecture is its constructive character. Throughout we trace the sound builder, the able mason, the ingenious carpenter, whose well-designed operations, satisfying the mind, carry with it the fancy, by natural consequence, in harmonious consent; and an unsought felicity follows as a matter of course. He wrought out his design through the model, and an intimate knowledge of the materials and careful consideration of the wants and requirements on the spot. His cornices and labels and water-tables explain their purposes of carrying off the wet; the buttresses are never for ornament alone, but proportioned to the support and durability of the edifice. No parasitical excrescences obtrude themselves ostentatiously, no parts and prettinesses are indulged which may not be accounted for by a natural grace and logical fitness. He was one of the first to recognise the utility of the four-centred arch, and to employ its depressed form where a superincumbent floor made it convenient. It is probable that he did not encourage that fashionable adoption of it which introduced it (under Edgington, his predecessor in the see of Winchester) into the cathedral itself; for we find uniformly the two-centred arch in his halls and chapels, while the four-centred was confined to situations of limited elevation. He was one of the first to condemn the tenuity, elongation, and weakness, real and apparent, of the Lancet and Decorated style, and to introduce the so-called Perpendicular, which, fortified by its mullions or constructive subdivision of skeleton framing or network, the enormous openings then demanded by the growing fashion of fenestral decoration. He abandoned the high-pitched shingle roofs, excluding sun and air, and was one of the first to employ the low pediment, and roof covered with lead; and in his works we first discover the hammer-beam roof in all its varieties—a system of the highest ingenuity and constructive economy, both for space and material, as well as beauty and power, as exhibited in Westminster Hall, Eltham Palace, Windsor Hall, and our college chapels and halls.

Fresco Painting in Pompeii.

G. ABBATE.

After many careful investigations, I have arrived at the conclusion that the Pompeian paintings were executed in fresco-secco; but at the same time there was mixed with the colours some resin, or other material capable of giving them tenacity, and rendering the impasto of the tints glutinous. The plaster upon which the painting was executed consisted of seven coats, exactly as Vitruvius has described them; the first three were of sand, the other four of marble dust, reduced from a fine to a finer texture as each coat was laid on, so that the last coat consisted of the very finest powder. These several coatings were laid one upon another, without allowing anyone to dry; the painter then commenced by tracing with the style the principal lines for the ground tints; he then indicated with the same style the figures and arabesques, and then proceeded to paint them in. It will be easily understood that where the painter commenced he found the wall moist, and hence his colours would unite themselves chemically with the lime of the intonaco or plaster into the pores of which they would readily insinuate themselves. As, however, he proceeded in his work, the wall would continue drying, and hence the amalgamation of the colours with the surface would be less complete. Thus, in the present day, we may easily and clearly discern that certain parts of the wall-paintings of Pompeii have altogether detached themselves from the plaster, whilst in other parts the adhesion has been complete and perfect, although the colours may have been applied in the thinnest possible state. Those portions of the wall which have lost their colours furnish a strong argument in support of these conclusions, since the scratch of the style which served to indicate the grounds, and give the main outlines of the arabesques and figures, was evidently made upon the wall whilst it was yet wet, and whilst the plaster was consequently in a soft condition. Wherever the colour has flaked off, the strokes of the style appear clean, precise, and most exact. If, as has been alleged, the paintings of the ancients had been made on a dry wall, it is certain that the strokes of the style could never have left a clean line, but would rather have shown a jagged or broken one, unequal in the depth of the various parts of the incision: this must necessarily have been the case with plaster presenting so hard a surface as that composed of marble dust. I am supported in this opinion by observing that where the painter has desired to produce an extraordinary effect, he has cut out the plaster and inserted a new piece in the middle of the wall, and upon that has executed his picture. Had it been the custom of that period to paint on dry walls, there would have been no reason for such a renovation, nor should we have been enabled to account for so curious a process. The art, then, of fresco painting, as it is understood and practised by us, was known to the ancients, since they, not less frequently than ourselves, painted on moist walls. The only difference between our method and theirs consists in this: that the moderns add the plaster piece by piece, as the picture is executed, so as to preserve the coating constantly moist and fresh; whilst the ancients applied the plaster over the entire surface, and immediately commenced painting—the moisture necessarily diminishing as the painting proceeded.

St. Sophia, Constantinople.

J. FERGUSSON.

I may allude to one other dome, that of Sta. Sophia at Constantinople, of which at last some authentic particulars have been obtained in the work of Salzenburg of Berlin, who, taking advantage of the scaffoldings erected by Fossati for the repair of the building, measured carefully every part of it. From this it appears that the diameter of the drum of the dome is 100 Prussian feet, or 102 feet 11 inches English, but the dome itself is 4 feet more, or 107 feet in diameter. It is constructed of forty ribs, projecting each 2 feet, which die away towards the centre, leaving about one-third of the dome perfectly plain. The form is segmental, 45 feet 6 inches in height, and described consequently from a point about 8 feet below the springing. Round the base are forty windows, which throw in a flood of light; and altogether its appearance internally is as beautiful as any I know of. Originally it was even flatter than it now is; but being in that form beyond the constructive power of its architect, it fell in, and the present form was adopted; but even then the architect tried to keep it as low as possible, judging correctly that the flatter it was the greater would be its apparent size, and also that of the floor it covered, and of all the parts around it. To obtain these internal advantages, however, the architect sacrificed the exterior entirely, and it is on the outside perhaps the ugliest dome ever constructed. But the same remark applies to the whole church. No pains whatever seems to have been taken with the exterior, though every part of the interior is designed with the greatest care, and ornamented with the most profuse liberality.

Classic Influence on Mediæval Glass Painting.

C. WINSTON.

The most careless observer can hardly fail to be struck with the resemblance between the glass paintings of and towards the middle of the twelfth century, and the illuminations in the contemporary Greek MSS., or with the frequent recurrence in them of Greek ornaments; and the same general character may be traced in glass paintings until quite the middle of the second half of the thirteenth century, when it gradually died out, before the increasing influence of a new style, of which the sculptures in the choir of Lincoln may be said to be an early and a favourable type. But the glass paintings which, on the whole, most closely resemble the antique are those which were executed between 1170 and 1240, or thereabouts. I am not seeking to deny that these works were executed by native artists either in France or England, but I cannot ascribe, as some have done, their greater freedom and closer likeness to good models merely to the progressive improvement of a school. It seems more reasonable to suppose that the change was in a great measure caused by the influx of Greek artists, the greater aptitude on the part of their pupils to profit by instruction. The draperies, instead of being tightly wrapped about the limbs and scanty in their proportions as in the earlier examples, are more elegant and flowing, reminding one of the voluminous draperies of the antique, which they resemble not only in the set but the very form of the folds, betokening a material thin in texture, and, from its pliancy, allowing the action of the limbs to be easily seen beneath it. The heads,

too, more nearly resemble the antique in their contour. In one of the windows of Canterbury Cathedral, erected shortly after the fire in 1174 (the second window from the west, on the north aisle of the choir), are some heads which might have been copied from the old Roman. There are some similar ones at Lincoln in glass, of the same date as that of the north rose, and now worked into it, though not belonging to it. There is also a strong resemblance to the antique in the fashion of the garments. It is well known that the Romans had in a great measure ceased to be the *gens togata* (*Romanos rerum dominos, gentemque togatam*) even in the reign of the Emperor Augustus, and by degrees the toga was reserved for State occasions. After the removal of the seat of empire to Constantinople, a variety of additional dresses were used, many of them of Greek origin, the more stately of which were, with its usual tact, appropriated by the Church as it gathered power, and which are the foundation of the Mass vestments of the Roman clergy at this day. The most popular dress amongst those nations who possessed themselves of the territories of the empire, no doubt, was the tunic, with or without the lacerna, or a shorter cloak used by the private Legionaries, called the sagum; and this dress, with slight modifications, appears to have been in actual use in the thirteenth century. With the exception of the legs and arms being clothed, there is but little difference between an ordinary thirteenth-century figure copied from glass and a figure taken from the arch of Titus, or Trajan's column. The long tunic reaching to the feet, so common in the glass paintings of the thirteenth century, also had its prototype in imperial Rome. The figures on the arch of Titus show that it was at that time often worn beneath the toga. Indeed, startling as it may appear, representations of the toga itself are to be found in pictures on glass of the thirteenth century; and I have little doubt in my own mind that the mantle which, carelessly thrown over the long tunic, constituted the conventional dress of prophets and of saints, not being ecclesiastics, throughout the Middle Ages, was, in fact, but a corruption of the toga.

The Interior of the Parthenon.

T. L. DONALDSON.

Mr. Cockerell, in the seventh volume of the Museum publications, has restored the interior of the Parthenon with two orders of columns. The lower are Corinthian, the upper are Doric. All rules of art, all analogy, and all probability have run counter to this daring arrangement. In the temples of Pæstum we find a double tier of columns, one over the other, to support the roof of the hypæthrum, both Doric; but the casual statement of Mr. Inwood, that a portion of a Corinthian capital was brought by him from the Parthenon, and a similar fragment discovered in the temple of Apollo Epicurius, at Bassæ, near Phigalia, seem to have been considered sufficiently grave authority for the introduction of the Corinthian, as one of the inner orders of the Parthenon. Assuming at once that Mr. Inwood got it from the Parthenon—How did it get there? Was it there originally? Had any other traveller—the precise Spon and Wheeler, or the laborious Stuart and Revett—ever seen it? Among the strange metamorphoses by Venetian, Turk, and Greek, may it not have been converted to the purpose of construction from some stray fragment beyond the verge of the Parthenon, as being lighter and more easily applicable for their purpose than the ponderous blocks of the construction of Ictinus? May it not have been purposely placed there by some wily Greek to give it additional value in the eyes of one who was eager for any fragment of Attic art, and profusely liberal to everyone who contributed to his collection? The introduction of the Corinthian order into the Parthenon involves so many serious questions in art that its adoption must rest upon some more authentic proof than that which accompanied this questionable fragment. But let us assume that it came from the Parthenon, and was always there. Is it too much to require the restorer to pause and consider whether this may not have been a fragment from some object quite distinct from the architecture? for we know from Pausanius that all the Greek temples of any size and reputation were filled with statues, groups, pedestals, candelabra, cars, tazzæ, tripods, vases, seats, and other articles of wood, metal, and bronze; the votive offerings of the conqueror, the supplicant, and the superstitious.

The Philosophy of Architecture.

K. T. SCHINKEL.

I perceived when I began my architectural apprenticeship a great treasure of forms, which, for scores of centuries past, have guided nations in the various phases of their culture in the execution of their buildings and structures. But I saw at the same time that our use of this treasure was arbitrary, and that what produced a most pleasant effect in its primitive usage was quite inappropriate in its present application to structures of this age. Especially clear became the conviction to me that in the arbitraryism of form-giving the real cause of want of character and style in so many of our modern structures is to be sought for. It became a vital question with me to arrive at the bottom of these anomalies, but the deeper I penetrated on this topic the larger and more comprehensive it appeared to me. At first I fell into the error of pure fundamental abstraction, and developed the whole idea of any given structure from its nearest trivial object and scope, and the three laws of construction. In following this course dry and stiff works will result, wanting in freedom, and excluding the two grand elements of architecture—the historical and poetical. I further inquired in how far the mere rational principle be sufficient for fixing the mere mechanical and trivial basis of an edifice, and how much there be required of the higher influence of the historical and poetical to elevate it to the conception of an art-work. It became clear to me that I had arrived at that point in architecture where the real element of art is to be placed, which in every other respect was and would be but a trade with a scientific basis! At the same time it became clear to me that in this stage of thought (here as in any other art) the dogmas of a doctrine became difficult to be uttered, and were perhaps reducible to a culture of feeling and intuition—qualities of the mind which comprehend in architecture a very wide compass, and require to be much and most variedly developed if their products are to yield great results. It appears to me necessary to ascertain properly the different spheres in which the feelings and intuition of the architect are to be developed, which will also enable us properly to survey the extent of this art branch. We have, therefore, to consider, first, what are the desiderata of our time in architecture; secondly, a retrospect on previous periods will show what has been then used for similar purposes, and what of that (considered in its perfection) may be useful and adequate now. Next the modifications of approved expedients are to be properly weighed. It is, however, chiefly necessary that (fourth) we inquire how imagination has to act in the assimilation and modification of these expedients—how, thence, the new product is to be treated in form and essence. This, however, is to be done thus, that it may still possess some historical basis, and that the conception of the new may arise without taking away the impression of an architectural style—by which doing the combined feelings of style and something primitive, and even ingenious, will arise in the beholder.

Malachite Veneering.

D. T. ANSTED.

The working of malachite on a large scale is extremely tedious and laborious, and is understood to be thus conducted:—The fragments of the stone are first sawn into thin plates, the thickness of which for plane surfaces is about a line, and for curved parts a line and a half. This cutting is performed by means of vertical circular saws, the blocks of malachite being cemented on a carriage, which, by means of a counterpoise, is made to travel along a small railroad placed on rollers, and is so contrived as to present the malachite in such a way as to insure the required thickness and keep the mineral constantly pressed against the saw. Fine sand and water are continually supplied to the part in contact with the block, and the latter is thus slowly cut through, but retained in its position by means of the travelling-frame already described. As soon as a plate is cut off it is removed, the machine reset to cut another plate, and the work recommences. The portions intended for curved surfaces are cut by bent saws fitted to the required shape—an operation which requires a large number of saws and great care in cutting, as it would not be safe to trust to cement for filling up spaces, and some of the joints require to be very neat. The next process in the manufacture is the fitting together the different plates and cementing them. For this the first thing to be done is to determine the pattern which the markings of the malachite are to represent. When this is decided on the surfaces by which the separate fragments of the mineral are to be united are prepared by the aid of wheels of copper, in such manner that for each joint two wheels are required, the projecting parts of one fragment entering a corresponding recess in the other. Joints thus made are not easily noticed, being formed with great accuracy, and not presenting any break or straight line to the eye. Until the establishment of their present factory by MM. Demidoff, the joints were straight, having no reference to the natural veins or lines of the malachite, and thus surfaces were placed together, in which these lines were not continuous, and had no relation with each other, or with any regular pattern. The substance on which malachite is veneered is generally iron or copper, but may be stone or marble. When this is covered the surfaces require to be levelled, which is done by means of sand. The interstices, of which many are left during the work, are then filled with a cement mixed with fragments of malachite, and coloured with powder of the same material; but in this part of the process much care is required less fragments should be introduced which do not adapt themselves to the pattern, and which would therefore injure the harmony of the work. The surface is finally polished.

NOTES AND COMMENTS.

WHAT becomes of the pictures and statues which are bought every year by the Government is a question that is sometimes asked in France. Modern works of a high class are supposed to be hung in the Luxembourg, and, when it was resolved to construct new picture galleries, every one expected to see numerous gems which had been lying for years in retirement. But when the galleries were opened in the early part of the year, few novelties were to be seen. The familiar paintings were again exposed, for the wall space was found to be too limited to allow of many additions. The stock which is in the official stores increases every year. It is supposed that at the present time there must be about two hundred paintings stowed away. In order that space may be economised, the canvases are taken off the strainers and rolled up. A picture is, however, comparatively safe, and an artist may look forward with a peaceful mind to the time when his turn comes to be represented in a public gallery. But the sculptors have not been so kindly treated. In most cases what is bought from the Salon is not a work in bronze, marble, or terra-cotta, but a cast in plaster. The sculptor assumes that he is to receive the commission to execute his design in an enduring material, but as seventy-five works in plaster may be discovered in the Minister's repository, it is evident that many sculptors must have suffered the pain of hope deferred. Some of them may no longer be living. The sculpture is not completed owing to the lack of funds, the paintings are not hung because the walls of public buildings are fairly filled already, and to find room it would be necessary to utilise buildings of secondary importance. The provincial museums are fairly stocked. It requires the exercise of a good deal of veneration by the painters whose works are buried to prevent them from desiring that some of the "old masters" in the Louvre, which are interesting to few, might be treated to a short spell of oblivion, and their places taken by the works which are now in that state.

A SUM of 5,000*l.* is to be expended on the furniture and fittings of the new School of Music on the Thames Embankment, which is likely to be completed by September 27, when the new term begins. There are forty-two classrooms in the building, and each is to have a table, a pianoforte chair, six ordinary chairs, a looking-glass, a stove and set of fire-irons, a rug and linoleum for the floor. In the practice-room will be one hundred music-desks, and three hundred chairs for the performers and audience. The committee-room and administrative offices will also be furnished. In this way about one-half the grant is to be expended. Blinds will cost 200*l.*, and a similar sum will be needed to erect the orchestra. The classrooms are heated by open stoves, but hot-water pipes will be used in the corridors and practice-room, costing 250*l.* For gas pipes and fittings the estimate is 500*l.* A hand-lift is to be introduced at a cost of 65*l.* For the organ in the practice-room 500*l.* is put down, and harps, double-basses, and other instruments are estimated at 300*l.* The students are to be inspired to follow the example of the great musicians by means of portraits, on which, and their frames, the expenditure is to be 60*l.* There is to be a fireproof floor to the practice-room and an escape staircase to the roof, both being afterthoughts, and entailing a further outlay of 100*l.* The whole of the expenditure may not exceed 4,500*l.*, but the committee prudently ask for 5,000*l.*

EVERY one who passed through the Louvre during the last couple of months must have observed a great number of old plaster casts lying on the strip of grass in the great court at the back of the Assyrian gallery. Hardly one of them is perfect, and they are suggestive of the *débris* that might be found in a modeller's yard after a bankruptcy or a removal. Why they should be exposed in such a place is beyond comprehension, for they made the public feel that the Louvre must have strange sights for any one who was allowed to get behind the scenes. It appears the casts had been long lying in the cellars of the museum, and as those parts of the buildings were lately explored in order to report on the safety of the Louvre, it was considered wise to get rid of some rubbish. It is intended to send the few casts which may have interest to the Museum of Comparative Sculpture at the Trocadéro, but the question arises, what is to be done with the remainder? It would be contrary to precedent to wilfully smash anything which has borne an official character for several years. The fragments cannot be sold, for a chiffonnier would turn aside from the heap of rubbish. We suppose they can hardly be brought back to the cellars. The Minister could order their destruction; but it is risky to come into collision with the officers of the Louvre, who might describe the loss as irreparable. The casts form a strange spectacle in a place where there is so much order.

IT is apparently the mission of the chemical experts who report every month to Sir FRANCIS BOLTON on the water of London to take the most favourable view of the fluid. Dr. FRANKLAND, who is also an official investigator, somehow rarely agrees with them. This time the experts have gone into the question of microbes, that are supposed to possess a dangerous character. The living things which, when magnified, help to frighten people from drinking water are not all foes to metropolitan ratepayers, for swarms of them are not only innocuous, but are presumed to be beneficent. There is, however, one micro-organism known as the *Bacillus anthracis* which is a foe to society, and it revels in the waters of the Thames and Lea. But, fortunately for us, if it has a merry life, it has also a short one. Put some representatives into water, and in the course of a few hours it will be "found to possess the property of setting up a characteristic growth of *bacillus*." If, however, it is kept for a longer time, the infected water loses the undesirable property. This is good news for consumers, especially if they can satisfy themselves that only the ghosts of the *bacilli* reach their cisterns. It has yet to be ascertained whether Dr. FRANKLAND endorses so optimist a theory.

THE Scottish judges appear to be more lenient to employers than their English brethren when interpreting the Employers' Liability Act. In the north it is not supposed that workmen can dispense with ordinary prudence, nor is an employer supposed to watch over them as if he were a nurse and they were babies. A slater lately claimed 25*l.* from a master slater in Kilsyth, on the ground that he was injured by the collapse of a ladder of inadequate strength while he was ascending it. But it appeared the employer's orders were that no more than two men should use the ladder at the same time, and on the occasion in question there were three. The judge, therefore, decided in favour of the defendant. In another case, a labourer fell from a gangway in a railway cutting. He suffered slight injuries, but he was attacked by illness six months afterwards, which he alleged was an effect of the accident. In this case, also, the decision was against the claimant. If the actions could have been tried in England the issue in both cases would probably be the reverse.

THE Forth Bridge is making steady progress. According to the latest official report 320,953 cubic feet of granite have been delivered, and 299,217 cubic feet set. About 90,700 cubic yards of rubble masonry and concrete work have been built, and 18,350 tons of cement have been used. The four skewbacks for North Queensferry, and one at South Queensferry, are in place, and a second at South Queensferry is partially fixed; the remaining two for South Queensferry and the four for Inchgarvie are rapidly approaching completion in the yard. Including the horizontal and vertical tubes already in position at the North Queensferry and Inchgarvie piers, 3,050 lineal feet of tubes of 12 feet in diameter, and 3,500 of 8 feet diameter have been fitted and drilled. Of the lattice tension members and bracing girders about 7,400 lineal feet are ready for erection, and the top junctions for North Queensferry and South Queensferry piers are nearly completely fitted. In all about 24,460 tons of steel have been delivered. The average number of men employed on the works is now 2,180. The register of wind pressure during the greatest gale of this year does not exceed 31 lbs. to the square foot.

THE ENDURANCE OF WATER-COLOUR DRAWINGS.

THE exhibition of old water-colour drawings has not convinced Mr. J. C. Robinson that the pigments can sustain constant exposure to light. He has received the following letter on the subject from Dr. John Percy, the chemist who has charge of the heating and lighting of the Houses of Parliament:—

"1 Gloucester Crescent, Paddington: July 7.

"My dear Mr. Robinson,—I have drawings made by myself about fifty-seven years ago in which the grey was made of indigo and Indian red. They have been kept in the dark ever since, and, so far as I can observe, no change has taken place. On the other hand, I have seen hundreds of drawings in which the greys used were the same, but from which the indigo has wholly disappeared in consequence of long-continued exposure to solar light. It would not be difficult to make a large exhibition of faded drawings of such men, for example, as Francis Nicholson, Copley Fielding, and De Wint. This subject of the durability of pigments with reference to water-colour drawing has engaged my special attention for more than twenty years, and some day, perhaps, I may communicate the results even at the risk of exciting the ire of some persons. Certain colours resist light, and others do not. My collection contains about 1,600 drawings, almost wholly of the early English school, and the work of about 700 different artists, so that I can speak with some experience on the subject. Facts as to the durability or non-durability of water-colour drawings are abundant and amply sufficient to settle the question. But, in order to explain the chemical changes induced by light, long and very accurate investigation will be required by men thoroughly competent for the work. I will mention one curious circumstance not so generally known, I think, as it deserves. It is imagined by some persons that in a hard, solid, compact substance, such as glass, chemical change under ordinary atmospheric conditions cannot occur. Now, you have probably noticed many years ago the pink colour of many windows in London. That colour was actually developed by the action of light upon the glass. Faraday, if I mistake not, first pointed out that where the glass had been protected from light by putty it remained colourless as at first. Oxide of manganese is used in the manufacture of window and some other kinds of glass to counteract the colour which would be produced by the ferrous oxide, which is always accidentally present in small proportion in the materials from which the glass is made. I will not here trouble you with the reason, which is well known. Is it not strange that the pink colour should result from the action of the light on the manganese compound in the glass? The manganese passes in consequence to a higher degree of oxidation, in which state it is pink or purple. If you take, as I have done, a piece of the window-glass coloured pink and heat it gently, it loses its colour and becomes quite colourless as it was at first. Thus we see that even in such a substance as glass chemical intermolecular movement may occur. If this be so, then we may expect a similar result in resins, of which varnishes are made. But I will not weary you longer.

"You may make any use you please of this letter; publish it wholly or in part if you think it worth while to do so.

"Yours very truly,
"JOHN PERCY."

Mr. Robinson says he learns from Sir Lyon Playfair that one of the results of the experiments undertaken at South Kensington is of a most unexpected and startling nature. Dr. Percy finds that a very fugacious water-colour pigment, indigo, has experienced no visible changes whatever from a direct exposure of 491½ hours to the most searching beams of the incandescent light. The South Kensington investigations, on the other hand, have revealed the fact that another of the evanescent colours, lake, which, indeed, fades away visibly in ordinary daylight, undergoes no change whatever when exposed *in vacuo*. If this fact be so, it seems to point to the nature of the causes, hitherto unsuspected, which, undoubtedly, induce greater permanency in pigments when "locked up" or protected by oils and varnishes than when employed as water-colours.

In regard to this particular pigment, lake (probably the ordinary crimson lake), a correspondent has just sent Mr. Robinson the result of his exposure of a washed tint of this colour for three days only in the varying light of a window casement. This gentleman improved upon the experiment recommended in the article in the *Nineteenth Century*, by covering alternate portions of the tint with strips of variously coloured glass. Three days' exposure only has sufficed to bleach this colour almost entirely off the paper in the unprotected portions; whereas, one of the coloured glasses, the ruby tint, has completely and entirely protected the pigment—this, again, is a significant fact. This pigment, crimson lake, and many others scarcely less evanescent, are, however, currently sold by colour merchants and continue to be used by water-colour artists. These fugacious colours were, indeed, more freely employed in former times than at present, and when it is considered that at the South Kensington Museum the water-colour drawings by Turner, De Wint, Copley Fielding, Barrett, and others, in which such pigments were freely and unsuspectingly employed have been exposed to strong light, sometimes, indeed, to the direct rays of the sun not for three days only, but for thirty years even, what must have been the inevitable result? Neither more nor less than what Mr. Ruskin has so explicitly shown, namely, that such drawings must have had these fugacious tints more or less completely "baked out of them" by the mere fact of such exposure.

The question in general has become one of serious public import, and it is time it should now be entirely removed from the heated atmosphere of controversy to that of precise and dispassionate scientific investigation. The South Kensington authorities, as it seems, have decided to refer the further consideration of the matter to a committee of professional artists. This, however, cannot be acquiesced in. Men of science rather than artists are the proper persons to investigate this matter; but all parties are entitled to a hearing.

Mr. Robinson hopes that as soon as Parliament meets again some member will move for a Select Committee of Inquiry into the entire question, but more particularly with reference to the conservation of the national art treasures; for the subject of the actinic influence of light vitally concerns many other categories of works of art besides water-colour drawings, especially so now that glass and iron construction is being everywhere introduced into our public museums and galleries, and that flooding with light from above, in great measure induced by such methods, has become the almost universal rule.

THE LATE G. E. STREET AS A RESTORER.*

THE truth seems to be that Street was no restorer by instinct or predilection. It may have suited his professional purposes to proclaim himself one, and a great following of church-restoring parsons may have taken him at his word. It is even possible that Street, with no lack of confidence in his own powers and accomplishments, believed himself to be England's only qualified restorer, holding in half contemptuous regard his more successful rival in that field, Sir George Gilbert Scott, as a mere manager of an ecclesiastical architecture factory run on a large, decorous, and highly remunerative scale. For this confidence in himself Street was not without some just assurance. His knowledge of all Mediæval architecture was immense and exhaustive, and in this respect there were grounds for comparison of his genius with that of the great contemporary Frenchman, Viollet-le-Duc, not greatly to the disadvantage of the Englishman. There, however, the comparison ended, for the Frenchman was analytical, patient, unegotistic, logical, and subservient to all circumstances of archæological evidence and the opinion of others—the Englishman, no less a student, but by temperament an active practical workman, aggressive, opinionated, and intolerant of weaker and more questioning minds than his own. It was, we can well believe, with an effort of self-restraint that Street bent his great powers to the mere reproduction of old architecture, believing in his heart that if it were not there to be restored in deference to a prevailing sentiment, a better architecture of original nineteenth-century Gothic, designed by George Edmund Street, R.A., 17 Cavendish Square, might have stood in its place.

About the time that Street undertook the restoration of Christ Church Cathedral his reputation as the first of living architects in every respect was on the wane among his brother architects. He had carried away the senses of younger contemporaries some twenty years before by his undeniably original and clever development of Gothic architecture in a style of his own. His was also the daring, among the first, to compass sea

* From an essay by Mr. Thomas Drew, R.H.A., in the *Dublin University Review*.

and all lands to import hints from the Gothic architecture of all Europe. Italian, Spanish, German, French were in turn his favourites, and influenced his un-English work. His style "took" at a period of new ritualistic activity, when a certain ascetic whimsicality, so to speak, was a fashion. As the glamour of novelty, however, passed by in following years, his once admirers and disciples began to return in restfulness and pleasure to dwell upon the loveliness of their own incomparable school of English architecture, and to see in the work of Street qualities of egotism, and an affectation of an ascetic simplicity and of force which were lacking somewhat in interest, grace, and picturesqueness for a new generation which began to hanker after these. When they recognised the hand of Street in his clever restorations of churches throughout the land, it was to chafe at his self-assertiveness as at a new cloth fretting an old garment. In a great competition among the foremost church architects of the day for the cathedral of St. Mary, Edinburgh, was perhaps heard the first whisper of doubt of the infallible capacity of the great champion Gothicist to compass a great design as a whole. Opinions began to be expressed that, after all, Street, with marvellous invention and constructive knowledge, with an exuberance of quaint details, and an alluring cleverness in the delineation of them, fell short somehow of the capacity to grasp the great central idea of a dignified building. His design for the cathedral, in which his utmost powers were pitted against those of his admitted rival, Scott, was pronounced to be, with a certain characteristic cleverness in parts, crude, unsatisfying, incomplete. The more commonplace, as it was called, design of Scott was preferred, as it rose more towards the familiar ideal of an English cathedral, and eschewed mere novelties and quaintnesses. It was about this time also that criticism of Street as a restorer began to be heard; and Street, combative and intolerant of criticism, was easily drawn into controversy. He professed to deliver discourses to students of the Royal Academy, but as we read them now they contain more of fiery and eloquent defence of himself—hurled at matured architects and the Society for the Protection of Ancient Buildings outside the Academy walls—than elementary instruction for architectural neotypes within them. That his touchiness at this period of his over-active life was extreme was evidenced in every utterance which he made. Whether in a Royal Academy lecture or a report on a village church, a short argument on a fragment of a "Fratry at Carlisle," or an elaborate account of his great restoration at Christ Church, Dublin, the occasion was seized for a fling at his persecutors, ostensibly in renewed protestations of the gospel of "reverent restoration," and by implication of his superior claim to be the first of restorers. In this he was perhaps not uninterested in the vast pile of fees accompanying such work, which was then passing over to that mere factory for church architecture at Spring Gardens, where architecture was turned out by an organised and "departmented" staff of "Scott's young men;" and not, as in the genuine establishment at Cavendish Square, where "everything is sketched, modelled, and corrected by my own hand."

To do this marvellously laborious architect no more than justice the comparison would be true, but whether an exuberant indulgence in multitudinous details is compatible with the work of a master-mind, ever strained by demands on it for the outline and composition of grand schemes, is open to question in art as in politics. It was at this time that two grand opportunities of vindicating his zeal and earnestness as a restorer came in Street's way—the completion of Bristol Cathedral and the restoration of Christ Church, Dublin. At Dublin, at all events, there was every evidence that he threw himself into the work with extraordinary enthusiasm. There he would be a restorer or nothing. "Previous failures in restorations of cathedrals," he preached, "had resulted from the restorers having too little reverence for antiquity, and from their having departed heedlessly from the old lines in which alone true safety was to be found." "The architect," he says, "who would even destroy the precious colour which age gives to a building with other evidences of its age, would be a barbarian whose conceit in his own taste leads him to set up his own choice of what is or what is not worthy to be preserved," &c. The result has been that in the exercise of his great resources of archæological knowledge and constructional skill, Street produced in his restoration of Christ Church Cathedral, so far as the interior went, one of the most remarkable and splendid works which the restoration movement of the nineteenth century has to show. It is a question whether any other living architect would have acquitted himself in this peculiar task so well. It may well be believed that the beauty of the old details which he discovered enlisted his genuine enthusiasm, and that he did not presume to think that he could invent better, and with this he combined the courage to advise the destruction of the hideous and uninteresting choir of fourteenth-century date, and the return to a wholesale rebuilding of the design of the eastern end as it might have been in its original thirteenth-century beauty. His raising and leaborating of the four great arches under the tower was also constructionally and artistically a bold and successful undertaking from which a more timid architect might have shrunk; and to the notable success of his treatment of this feature is due a main element of beauty of the building which possibly was wanting in the original design. In many instances, however, in the history of this work the contending forces in Street's temperament are curiously illustrated; at one time his desperate tenacity as an out-and-out restorer, and at another his self assertiveness, over-weening confidence and dogmatism.

At the very outset the choice of a stone to be used in the work was characteristic of the man. Looking at the old stone used in the wrought work, Street, without hesitation, pronounces it to be Caen stone brought from Normandy. "But Mr. Street," say local dissentients with all humility, "take a piece of the old stone in one hand and a piece of the Caen stone you would now use in the other and say if they do not widely differ; one a coarse gritty texture and good weather stone, the other a soft close-grained stone—and besides, Mr. Street, we know that the old stone has withstood the weather well for 600 years, whereas we know that Caen stone will not withstand our Irish climate for one year." "Don't talk to me," says Mr. Street in effect. "I know all about Caen stone. I have used quantities of Caen stone in my buildings in England. This is Caen stone. Under the circumstances I adhere to my original opinion. I am a restorer. I am not discussing the question of Irish weather. I am going to use Caen stone." In a testy footnote added to his account of the restoration, within a month or two of his death, he reasserts that he is right and others wrong about this stone at a time when advanced decay was already visible in the new work, and pieces of the moulding and carving were occasionally falling off.

The design of the exterior of the clerestory, as Mr. Street himself admits, is "certainly to my taste not beautiful." When the old wall was being examined, triplet windows were discovered in the clerestory which could not be described in their exterior aspect as being anything but hideously ugly. The label mouldings over the centre light did not appear to belong properly to it, the curves not being struck to the same radii, and the side ones were straight-sided and incongruous. Nothing like them had ever been seen in Gothic work before; the mouldings were petty and miserable. To any ordinary eye these suggested an unhappy patching and facing at some time subsequent to the original building, but "No!" says Mr. Street dogmatically. "It is simply impossible to doubt" that these are original. "I had laid down for myself," he says, "out of respect to the old building and its architect, the strict rule to restore absolutely and exactly whatever I knew or could discover to have originally existed. And that no one may hereafter assert (as has, indeed, already been done by some ill-informed persons) that there was no justification for such a restoration, one of the original windows in its decayed condition, just as it was found, has been erected in the crypt as evidence past contradiction." A testy footnote as before in reassertion of this would show that Mr. Street has been chaffed by brother architects about these windows of his. The "evidence past contradiction" set up in the crypt would, for those accustomed to the construction of masons' work, if anything, tend to prove the opposite of Mr. Street's dogmatic pronouncement.

In another marked feature of the restoration Mr. Street's inconsistency of theory and practice is strikingly illustrated. He was the first to broach the interesting theory, an undoubtedly sound one, that Christ Church Cathedral was the work of English builders—of the school of builders which had its rise at Glastonbury and Wells, and came towards Ireland, leaving traces at Llandaff, St. David's, and Cwm Hir Abbey. The church was the foundation of the English invaders. It was ever the church of the English colonists of the principal Pale city, as in fact it remains still of the community who are mainly of English origin. It was, as Mr. Street insisted, a characteristic English work built by skilled English hands in Ireland, and by inference had nothing in its original state characteristic of Irish peculiarity about it. Yet Street, the rigid restorer, would not be content without going afield to find out some peculiarly Irish feature to adopt in it, if for nothing else to show his familiarity with the architecture of all lands. When he came from Italy in earlier days he could not be restrained for some time from airing his Italian-Gothic experiences, congruously or not, in every work he touched, and when in later years he visited Spain, he imparted a Spanish flavour to his English work, in spite of himself, for some time. When he went to build an English church at Rome, he must needs "do at Rome as the Romans do," and build his church in the inferior and impure Italian Gothic manner according to Street, on Italian soil, rather than make it, as most people would say more consistently, an English church for people of English speech and descent in a foreign country, distinctly showing its origin in the noble and incomparable style of England. So at Dublin, Street went looking about among photographs and illustrated works for something very Irish, and came to the conclusion that Irish "stepped" battlements to his parapets were just the thing. The type he designed or adopted was not

a happy one or graceful in itself, and it is a matter for endless regret that for this architectural fad, joined with an austere whimsicality which he affected, he should have made the newly-designed features of the exterior so needlessly ugly and unlike what the old work doubtless was. In the matter also of the remains which he failed to discover, and which might be traced out by a more patient and less talented investigator, the characteristic impatience and dogmatism of Mr. Street again appear. All the essential clues to this discovery were in his hand. He says himself, "At the south side there had, doubtless, been a cloister; on the east side (in 1761) stood the Exchange, evidently standing on the site of the ancient chapter-house, and probably retaining its ancient walls. Between this and the south transept was the narrow passage or 'slype' so universal in large churches." Even in this he was impatiently wrong. The very evidence from which he was quoting (Reading's Map of 1761) if patiently looked at showed the slype not in this unusual position, but in the more universal one on the south side of the Exchange—and what he called the slype was the staircase and door, clearly shown, which led from the dormitories to the church. "It is interesting," he adds, with some self-satisfaction, speaking of this old plan, "to find these arrangements still visible to an eye accustomed to examine the plans of cathedral churches in the midst of what, to an ordinary eye, would appear to be the most confused jumble of walls and buildings." And yet he propounds no plan of what was so stated to be visible. He states that the buildings had been removed, and even with an excavation open before his eyes adjoining the recent discoveries, with the old staircase disclosed, and the massive masonry of the chapter-house wall visible, he is preoccupied with the theory he has laid down, and strangely indifferent to any signs which would vary it. He finds in the south aisle that doorway usual in the universal plan of cathedrals on the north or south side as the case may be, which leads to the eastern avenue of the cloisters, and steps descending from it. Even the most familiarly-remembered plan of Westminster might at once suggest this. All Mr. Street, however, had to say of this door was that it "led to a building outside the aisle, and thence by a flight of steps down to the crypt by another archway in the west wall of the transept." A remembrance of the universal plan might suggest that there was no such connection between these doors, but that the last-mentioned entrance to the crypt very naturally faced the northern cloister walk. Again, near the present south-west porch in the crypt is discovered a doorway built up, with its three foot-worn steps, probably trodden by great Laurence O'Toole himself, indicating the eastern walk of the cloister, and absolutely fixing its level. By it stood the upper part of the Abbey "parlour gateway" emerging from the ground, and yet it is characteristic of Mr. Street, most acute and instinctive in investigation, having preoccupied his mind with another theory as to levels, to shut his eyes to such evidences as these. The Abbey gateway he does not attempt to puzzle over, but restores it at a higher level as an entrance to the church in a corner.

In one (like the writer of these lines) coming after Mr. Street, with great humility and profound admiration of his great genius, and his, on the whole, marvellous and magnificent achievement at Christ Church, it was not a sign of profound erudition or second sight to ponder on these evidences, and having seen that the crypt level was near the cloister level, to surmise that under the 9-foot accumulation of *débris* there might still be remains of cloistral buildings, and so to state in a communication made (with an illustrative plan) to the Royal Irish Academy in 1882. The opportunity for investigation came when the Open Spaces Committee of the Mansion House Relief Fund of 1886 placed at disposal a large sum for laying out the cathedral precinct as a public garden. Then proceeding to the assumed position of the north-east corner of the chapter-house, a few hours' digging revealed some beautifully moulded angle wall-shafts still *in situ*. Following on the clue, the whole lower part of a grand eastern window, coeval in style with that of the nave, circa 1230–50, was revealed. Thereafter, by removal of many tons of rubbish, the whole area of a fine chapter-house, 42½ feet long by 27 feet wide, was cleared, and also the genuine "slype" (not according to Mr. Street), and a staircase leading to the crypt, between the chapter-house and transept, and the cloister walks, uniformly 7½ feet wide, on the eastern, northern, and western sides. On the southern side the railings and roadway of Christ Church Place, and the overhanging bank, precluded further digging in that direction. A calculation made from the old leasehold map, which gives the position of a narrow strip thereon, which "serves as a back-side to Mr. Silcock's house in Skinner's Row," shows that at a distance of 82 feet 4 inches from the south transept lies the southern precinct wall, and presumably some remains of the old refectory. On the western side of the cloister-garth have been disclosed the massive foundations of the Domus Conversorum; that "Commons House of Christ Church Cathedral" erroneously so written, in which sundry parliaments and convocations met.

THE LATE DAVID STEVENSON, C.E.

OUR obituary of yesterday (July 19), says the *Scotsman* contained the intimation of the death of Mr. David Stevenson, an eminent citizen, and long and widely known as one of the heads of the engineering profession. He was the senior member of the firm of D. & T. Stevenson, engineers to the Board of Northern Lighthouses and the Fishery Board of Scotland for harbours. He has been practically laid aside from work during the past three years, the business for some time having been conducted by the present firm, consisting of his brother Thomas, his two sons, and Mr. Alan Brebner. He had gone as usual to North Berwick at the beginning of last month, but on Thursday last he had a paralytic stroke, and passed peacefully away on Saturday evening.

Mr. Stevenson was the third son of the late Mr. Robert Stevenson, the engineer of the Bell Rock Lighthouse, and was born at Edinburgh in January 1815. Educated at the High School and University of Edinburgh, he, unlike his brother Alan, who was originally destined for the Church, elected from the first to follow his father's profession. Before entering on his apprenticeship he was for some time in the workshops of one of the best practical millwright engineers of his day, where he acquired manipulative skill and the proper methods of working in different materials—a course he always advocated for those who intended to follow the profession of civil engineering. In his presidential address of 1869 to the Royal Scottish Society of Arts, on "Altered Relations of British and Foreign Industries and Manufactures," he fully stated his views, urging the propriety of artisans improving their manipulative skill and their knowledge and management of the materials with which they had to do deal. After serving a regular pupilage as a civil engineer, he was for some time engaged with Mr. Mackenzie, contractor on the Liverpool and Manchester Railway, and he gave a description of this important railway scheme to the Society of Arts more than fifty years ago, and was awarded their medal for his exposition. He then returned to Edinburgh, and, in conjunction with his father and his brother Alan, began practice as an engineer. During the year 1837 he made a three months' tour in Canada and the United States, the result of the inspection of the engineering works of these countries being published in a volume under the title of "Sketch of the Civil Engineering of North America," which was subsequently republished as one of Weale's Series of Engineering Works, as peculiarly applicable to new countries where engineering works on an extensive scale, in which timber forms a chief element, would yet be in full operation. The views expressed and the drawings given in this book with reference to the fine lines and speed attained by American rivers steamers were received in this country by shipbuilders with distrust; but the bluff bows of British seagoing steamers soon gave way to finer lines, shipowners finding that great speed could only be attained by following the example of the American shipbuilders.

Along with his brother, his advice was much sought in regard to the improvement of rivers and harbour and dock works. There are, indeed, very few rivers or harbours in Scotland with which he was not in some way professionally connected. His practice was not, however, confined to Scotland, and he was called on to report on the improvement of the rivers Dee, Lune, Ribble, and Wear in England, the Erne and Foyle in Ireland, while the Forth, Tay, and Nith were improved under his advice, and extensive works are now in progress on the estuary of the Clyde from the designs of the firm. He was the first to enunciate the true theory of the origin of bars at the mouths of rivers, and also to define the different compartments of rivers and estuaries, and the proper treatment which each should receive for their improvement. His book on "Canal and River Engineering," giving the results of his experience in the treatment of rivers, will long remain the standard work on the difficult subject of which it treats. Originally written at the request of his old friend, Mr. Adam Black, about thirty years ago for the "Encyclopædia Britannica," it was shortly afterwards published as a separate treatise, and it is now in its third edition. In 1853, Mr. Stevenson succeeded his brother Alan as engineer to the Northern Lighthouse Board, and along with his brother Thomas he designed and executed no fewer than thirty lighthouses, two of which—on Dhuheartach and the Chicken Rock—are triumphs of engineering. In addition to the Scottish lighthouses, the advice of the deceased's firm was taken by the Governments of India, New Zealand, Japan, and Newfoundland on lighthouse matters, and under their direction schemes for the lighting of the whole coasts of Japan and New Zealand were matured, and are now being carried out. In connection with the lighting of the coasts of Japan, where earthquakes are frequent, Mr. Stevenson devised the aseismatic arrangement to mitigate the effects of earthquake shocks on the somewhat delicate optical apparatus used in lighthouses.

Mr. Stevenson frequently appeared before Parliamentary Committees, and also gave evidence before several Special

Committees and Royal Commissions on Harbours of Refuge, River Improvements, and Lighthouses. He was a most conscientious witness, never entering the box without being thoroughly satisfied as to the soundness of the cause he was supporting. In Edinburgh Mr. Stevenson was greatly respected, and his advice on many important matters connected with the city was eagerly sought and highly valued. His views on the city improvement scheme, as conveyed to Lord Provost Chambers and Mr. David Cousin, city architect, along with his letters which appeared in the *Scotsman* at the time, greatly facilitated the accomplishment of this great sanitary improvement. It may also be mentioned that his firm designed and carried out the Edinburgh and Leith sewerage scheme, and the widening of the North Bridge.

In addition to many papers, principally on engineering and cognate subjects, read before different societies, Mr. Stevenson found time, amid the exacting calls of his profession, to write several books which have taken a permanent place in engineering literature, such as "The Application of Marine Surveying and Hydrometry to the Practice of Civil Engineering," "Reclamation and Protection of Agricultural Land," "The Principles and Practice of Canal and River Engineering." He also wrote several articles for the last and present edition of the "Encyclopædia Britannica," among which may be noted "Canal," "Cofferdam," "Diving," and "Dredging." He was also the author of "Our Lighthouses," being two articles written for his old friend Dr. Norman Macleod, while editor of *Good Words*, and subsequently published by Messrs. Black; and of the "Life of Robert Stevenson," published in 1878.

Mr. Stevenson was elected a Fellow of the Royal Society in 1844, and he subsequently acted as a member of council and one of its vice-presidents. He was a member of the council of the Institution of Civil Engineers, and a member of the Society of Civil Engineers, Paris, and of other learned societies. He was consulting engineer to the Highland and Agricultural Society, and to the Convention of Royal Burghs. Mr. Stevenson took a deep interest in everything connected with the Church of Scotland, and was for many years an elder in Greenside, and afterwards in St. George's Church. He was a man of sound judgment, utterly devoid of ostentation, kind, open, and easily accessible. Mr. Stevenson leaves a family of two sons, as already noticed, and four daughters, one of whom is married to Mr. Napier, W.S., and another to the Dean of Faculty.

THE HARRISON MEMORIAL, EDINBURGH.

A PRIVATE meeting of the subscribers to the fund for providing a memorial of the late Sir George Harrison was held in the Council Chamber, Edinburgh, Lord Provost Clark in the chair. About thirty gentlemen were present. The business was to consider a report by the acting committee, which recommended that the form the memorial should take should be a stained-glass window in St. Giles's Cathedral. It was stated that the sum of 630*l.* had been subscribed, and that 150*l.* would be added if the memorial were a window in St. Giles's. In connection with this point, the following letter to the Lord Provost from Mr. J. R. Findlay was read by the Town Clerk:—

"Aberlour, July 17, 1886.

"My Lord,—I regret that I shall not be able to attend the meeting on Monday of subscribers to the fund for providing a memorial of the late Sir George Harrison; and also that I was not present at the meeting of the acting committee, at which it was resolved that the memorial should be a stained-glass window in St. Giles's Cathedral.

"From this resolution I should have respectfully dissented, and desire to do so now.

"It seems to me that it would be curiously inconsistent if the Harrison memorial should take this shape, when a like proposal has just been rejected with reference to Lord Provost Chambers, in whose case there would have been a fitness in that place and form which is entirely wanting in the present case. Sir George Harrison was in no way specially connected with St. Giles's; he was not even a member of the congregation. It may be admitted that St. Giles's is an edifice of an historical and monumental character, and that a stained-glass window there is a suitable tribute to the memory of any distinguished citizen, but I see no reason for haste in appropriating those windows to the memory of one generation, and I humbly submit that the appearance and effect of the present stained-glass windows in St. Giles's does not afford much encouragement for additions of a like kind.

"Another proposal has been made, and has, I believe, found favour with the members of Sir George's family, whose views are certainly entitled to some consideration in the matter. It is that the memorial should take the form of an ornamental gateway at one of the entrances to Blackford Hill. The idea recommends itself as being out of the ordinary and hackneyed line of busts, commemorative statues, and stained-glass windows, and the situation is appropriate as being connected with one of the last of the many important services which Sir George Harrison rendered to the city. It may be said that the fact that he was instrumental in securing the park for the city is not likely to be forgotten, and that the park itself is a lasting and sufficient memorial; but it will also be admitted that a monument on the spot would further perpetuate and emphasise the fact.

"Such a gateway would give scope for a certain display of architectural and artistic ingenuity in a fashion now somewhat unusual, though not altogether unknown in Scotland; and in a due combination of stone and ironwork a very striking and interesting addition to the amenities of the hill might be produced. At one of the entrances to the Meadows we have a gateway commemorative of the gratitude of the Messrs. Nelson for the temporary use of a piece of public ground, and more recently another has been added, which will perpetuate the interest taken by Scottish masons in the Edinburgh International Exhibition in 1886. Both of those gateways are pillars without gates; but I should expect that the ironwork of the proposed Harrison gateway should be one of its most striking features. That artistic work in wrought iron formerly flourished, to some extent at least, in Scotland, and as in most Continental countries, several examples still existing sufficiently testify. Notice was recently taken, at a meeting of the Society of Antiquaries, of an elegant iron railing on the staircase of the mid-steeple at Dumfries, now unfortunately neglected and falling into decay. There are several iron gateways of elegant design still existing in the neighbourhood of Edinburgh, notably one at Gogar House, and another at Hatton House. The railings at Holyrood House may also be cited, though of course they are, I believe, English, and comparatively modern; and if more ornate examples are desired, we have the Hampton Court railings, and one, if not two, elaborate and beautiful gates exhibited in the museum of science and art. By a suitable inscription, or, still more emphatically, by the introduction of a bust or medallion in connection either with the stone or the ironwork of the structure, its personal and commemorative significance could be distinctly accentuated; and were a fitting design obtained and adopted, the Harrison Gateway at Blackford Hill would remain 'a thing of beauty, and a joy,' if not 'for ever,' at least to many generations of interested and grateful citizens.—I am, my Lord, yours faithfully,

"J. R. Findlay.

"The Right Hon. the Lord Provost,
"City Chambers, Edinburgh."

Some discussion took place on Mr. Findlay's suggestion, several gentlemen approving of it; but the majority of those present seemed to be in favour of a memorial window.

It was, therefore, resolved that the memorial should take the shape of a stained-glass window in St. Giles's Cathedral, and a remit was made to the acting committee to carry the resolution into effect.

THE BIRMINGHAM ASSIZE COURTS.

A FINAL selection was made on Monday by the General Purposes Committee of the Birmingham Corporation of a plan of the proposed new Law Courts for recommendation to the Town Council at its meeting in August. It will be remembered, says the *Birmingham Post*, that out of the very large number of sketch-plans which were sent in some months ago by competing architects five were acknowledged to be of exceptional merit, and the gentlemen who had designed them were asked to send in completed plans. Two of the five sketches are believed to have been those of local architects. The completed plans have for the past few weeks been under examination by Mr. Waterhouse, whom the Council retained as consulting architect, and have also been privately inspected by representatives of the various classes of people for whose accommodation the new buildings will be principally erected. Yesterday the General Purposes Committee, after a sitting of three-quarters of an hour, found little difficulty in deciding to recommend the adoption of the design embodied in the set of plans marked "Terra-cotta." The design is for a terra-cotta and red brick structure in the Gothic style of architecture. Its leading feature is that through a central entrance access will first be gained to a main hall, which will run parallel with the street, and of which the roof will be visible behind the ornament of the frontal elevation. This is a somewhat important departure from the sketch-plans of Mr. Waterhouse, which showed a main hall one of whose ends was towards the street. Out of the main hall a corridor running in the direction of Lichfield Street will lead the visitor to the superior courts, and on each side of the corridor there are placed courts for the magistrates, the coroner, &c. The design will probably undergo some modification when the architect is brought into consulta-

tion with the committee. It is more particularly desired that the access to the minor courts shall not be such that the suitors who attend them will in any way block the passage to the superior courts. The plans will presently be laid open for public inspection.

ARCHÆOLOGY IN LINCOLNSHIRE.

A LARGE party of the members of the Lincoln and Nottingham Archæological Society lately had an excursion to Somerton Castle and several churches in the district south of the city of Lincoln. The following notes on the buildings were prepared for the occasion by the Right Rev. Dr. Trollope :—

All Saints, Canwick.

Externally this church has not a promising aspect for students of Gothic architecture, but after an inspection of its interior I feel sure that all will think it well worthy of inspection. Originally it was a small Norman structure, consisting of a nave, tower, north aisle, and chancel of the earlier part of the twelfth century, of which the aisle arcade and chancel arch are the principal remaining features. The first consists of a massive circular shafted pillar in the centre, having a scalloped cushion cap, and two corresponding responds, the second is the principal ornament of the fabric, and is a grand specimen of its date from its size and the richness of its carving. Its jambs are relieved by three pillars on either side, carrying a semicircular arch of three members, enriched by the chevron and billet moulds. On the east wall of the aisle is a fragment of a Norman abacus and a springer of an arch, probably once forming an arched recess over an altar below. The tower apparently stood on the space now occupied by a bay, added to the nave during the Decorated period, from the evidence of a small piece of early roll-moulding still remaining in the lower part of the western face of the present inner wall of the tower. Of the Early English period we have the arch, lately revealed in the north wall of the chancel, springing from corbels, made up with plaster below, formerly opening into a chantry chapel now represented by the vestry, within which is an Early English reredos, still remaining in its original position ornamented with shallow arcading below a small two-light window of later date. The font, also, is chiefly of this period, but seems to have been tampered with. Of the Decorated period are the two large three-light windows in the south wall of the nave, the westernmost one being apparently a later copy of the other, and also a small two-light window in the tower. The rest of the fabric is modern.

All Saints, Branston.

Remains of a venerable fabric are still incorporated in the present structure—namely, the lower part of the tower, the masonry of which, from its long and short work, is certainly very early Norman, if not of a prior date. The nave has good aisle arcades, supported by octagonal shafted pillars, and in 1876 an additional aisle was added to the fabric on the north side, through the medium of a new Perpendicular aisle. The clerestory and roof are Perpendicular. The chancel is a good specimen of the Early English style. The triplet at the east end, of the same character, is modern. In the south wall is a pair of lancets, now stopped up, a set of three sedilla, and a piscina. In the floor of the chancel is an old Purbeck marble stone, incised with a beautiful cross, and bearing this inscription in Lombardic letters, "Icy gist Sir Richard de Thiselton iadis person de ceste eglise." Near the west end of the north aisle is a fine monument, erected in memory of Sir Cecil Wray and his wife. He was the thirteenth baronet, of Glentworth, the builder of Fillingham Castle, M.P. for East Retford, and subsequently for Westminster, but was eventually ousted from that seat in the celebrated election of 1784 by Fox, chiefly through the help of the famous Duchess of Devonshire, and died in 1805. All the fine old bench ends of this church were carefully preserved at its restoration, and are still doing service. Here, also, are some memorials of the Bertie family.

All Saints, Nocton.

This is an entirely new church, built on a new site, partly by the late Countess of Ripon and partly by the present Earl de Grey, after plans provided by the late Sir Gilbert Scott, in the style of the close of the thirteenth century. Its most conspicuous feature is its tower, surmounted by an octagonal belfry stage and graceful spire, rising altogether to a height of 120 feet. This is attached to the south-western bay of the nave, and its lower stage serves as a porch to the church. The whole structure within and without clearly indicates that no cost was spared in its erection ; which is not surprising, as one portion of it was built as a memorial of a wealthy earl and the other of a countess. Hence sculpture and painting and marble have been lavishly bestowed upon the adornment of the fabric, raising it in this respect far above most churches, and indicating the unsparing liberality of its founders. Perhaps the clustered pillars of the aisle-arcades, with their square abaci, are rather too plain and massive to accord perfectly with the rest of the fabric, and their arches too wide and low, and although the profuse carving of the caps, corbels, and medallions of this church is admirably executed, we should have preferred the adoption of conventional rather than realistic designs for these; but nowhere else to-day shall we see a church anything like as richly adorned with painted glass and other ornamental work applied to such features as its reredos, pulpit, and font ; nor shall we see any modern monument elsewhere such as the one here commemorating the late Lord Ripon, through the skill in sculpture of the late Mr. Noble.

St. Peter's, Dunston.

Only a few ancient features now exist in this church, such as the arch of its porch, the tower, and a Decorated monument. The whole of the remainder was erected in 1876, chiefly at the cost of the Marquis of Ripon. It is a comely edifice, consisting of a nave with north and south aisles, chancel, organ-chamber, and vestry, besides the old tower. For the information of our visitors I may say that in this parish, although distant from its church, stands a pyramidal lofty shaft, commonly called Dunston Pillar, erected by Francis Dashwood, Esq., in the year 1751, to serve as a beacon or lighthouse to travellers crossing Lincoln Heath, which, from its size and roadless condition formerly, often led to loss of life. Originally the pillar was surmounted by a lantern chamber, which for a time doubtless proved a great boon to those who had occasion to travel between Lincoln and Sleaford in winter or in foggy weather. Eventually this was blown off, and not replaced; but in 1810 the pillar was crowned by a terra-cotta effigy of George III., commemorating his jubilee, or the fiftieth year of his reign; now suggesting the fitness of devising another local monument of some kind or another, to serve shortly as a memorial of our present Sovereign's jubilee, when her beneficent reign has reached the end of half a century, and then, as now, we may, in all loyalty and affection, say, "God bless her!"

St. Oswald's, Blankney.

The aisle arcades of this church, the arcade giving access to what was originally a chantry chapel, of late happily restored to use, the arch of the porch, and a sepulchral slab inserted in the pavement of the sacrarium, are the only ancient features. This last commemorates "John de Glori," a representation of whose bearded head is carved within a cusped recess of this slab, giving the idea of a partly open coffin. About sixty years ago the greater part of this church was rebuilt, and again, with the exception of the tower and its arcades, was almost rebuilt in 1880, as its predecessor had become unbearable through the extreme dulness and plainness of its character. Now, we see here a very comely structure, adorned with good painted glass in the windows, by Clayton & Bell, and very tasteful furniture. In it, and also in the churchyard, are costly monuments erected in memory of the late Lady Florence Chaplin, whose touching death created so much public regret, and will doubtless be viewed with general sympathy.

St. Peter's, Navenby.

This is the finest church we shall visit to-day, and its site is worthy of such a beautiful fabric as this is, notwithstanding the loss of its former tower and spire, now represented by the present tower. This occurred in the last century, and destroyed the porch, the west end of the south aisle, and two of the clerestory windows. Besides the tower, the fabric consists of a nave, north and south aisles, south porch, chancel, organ-chamber, and vestry. On entering, the eye will be at once attracted towards the oldest feature of the nave, viz., the extremely beautiful westernmost pillar of the north aisle, which, with the adjacent respond, are of the Early English period. This consists of four solid circular shafts, alternating with circular shaftlets, tied together in the middle by an encircling band, and having a beautifully moulded cap and base, which last unfortunately is not now wholly exposed to view. The whole of the remaining portions of the fine aisle arcades are Decorated. These are surmounted by a perpendicular clerestory, having five lights on either side, and a richly pannelled and embattled parapet above. The present roof is in part supported by the old corbels, on which are shields ; one of these bears the white hart couchant, gorged and chained, or badge, of Richard II. Another, Arg., a fesse vair Or and G between three waterbougets I, for Dethicke ; a third, Arg., a chief G on a bend Az., three escocheons of the first, for Allistree ; and a fourth, Arg., 10 Torteaux a label of three points Az., for Babington. In the south aisle wall are three intersecting lancet windows, the hood moulds of which end externally with the Cistercian mask ornament. This has been prolonged eastward, to serve as an organ chamber. The windows of the north aisle are poor two-light square-headed ones, only otherwise relieved by a now closed doorway. Its western window is new, and made to correspond with the one at its east end. The chancel arch is Early English, and remarkable from its very slender keel-shaped piers and its wide and lofty arch. On the south side of this arch is a bracket on which are carved two large leaves, such as those of a caladium,

and a female wimpled head and flower, probably required formerly to support some portion of the rood loft. It must have been a noble benefactor who rebuilt the grand chancel of this church, which is coeval with those of Heckington and Horton, and disproportionately large as compared with the nave; but although his remains lie beneath a beautiful monument on its northern side, unfortunately his name is lost. Without, the excellent base mouldings of this fine structure and those of its beautiful windows, so well designed, and so spacious, are simply admirable; and now that the great east window has been again supplied with its lost crown, it is, indeed, a pleasure to look upon the interior of such a church terminating in such a chancel and such an east window, sheltered by a high-pitched roof, serving as its canopy. Most beautiful is the memorial of the founder of this chancel, on its northern side, rich in delicate carving, ending in a bouquet of conventional leaves and pendent berries, serving as its finial. And most curious, as well as beautiful, is the receptacle for the Easter sepulchre eastward of it. On the left of this is the figure of an angel and another of the Virgin Mary, on the right one of Mary Magdalene, holding a box of ointment, and the other Mary. Below are the figures of three Roman soldiers, correctly standing on guard, in full coeval armour of the fourteenth century, instead of sleeping, which they did not do. On the south side are three sedilia and a piscina, effective in design, but far inferior to the founder's monument and the sepulchre opposite to these.

All Saints, Coleby.

This is a most interesting church, from the antiquity of some of its features and the beauty of others. At a distance the form of its tower and spire is both striking and pleasing, yet they were built at very different periods, and the architect of the spire deserves posthumous high praise for the manner in which he crowned the very old Norman placed in his hands, as he has done, with so graceful and so well proportioned a spire of his own Perpendicular period. We only regret to observe that this tower has, from necessity, lately been largely braced with iron bands to hold its masonry together. It is of about the same date as the one at Harmston, and is pierced with two of those peculiar little lights to which, from their shape, the term of "key-hole" has been given. The head of one of these is enriched with the billet-mould and the other with the loop-mould, seen in Stow Church and elsewhere. To this was added, in the Perpendicular period, an upper stage, surmounted by a varied parapet and pinnacles, and a very graceful and well-proportioned spire, having flying buttresses, connecting it with the tower. Within the outline of its original arch, giving access to the nave, may be seen around the head of smaller Perpendicular successors, probably erected when the spire was built. Of a later Norman period is the north aisle arcade. This consists of a central circular-shafted pillar, springing from a square base, and two corresponding responds, having scalloped cushion caps, supporting semicircular arches, on which the billet-mould is introduced. The south aisle is entered through a porch and beautiful doorway. Unfortunately, the proportion of this porch is marred by the after addition of a parvise or priest's chamber above it. The arcade of the south aisle is really lovely. Its pillars rise from bold octangular bases, originally serving as seats, and are octangular themselves, consisting of alternated plain and circular features, carefully moulded bases, and varied caps. The westernmost of these is plain, the central one most gracefully foliated, giving the idea of the actual springing forth of leaves from the stonework, and the easternmost enriched with similar ones, which, through a different treatment, seem to be yielding to the wind. The font also is a beautiful one, of rather an earlier period than that of the south aisle. It stands on a square base, and appears to be cut out of one large block. Its bowl is circular, and enriched with intersecting arcading and the nail-head ornament. From the angles of the square base spring up to the top of the bowl slender octagonal pillars, the foliation of whose caps trails over the surface of the bowl. Some of the old bench ends were brought from Hackthorn Church when that church was reseated. The chancel is entirely Early English. Its arch is very remarkable from the extreme slenderness of the pillars serving as its piers, and the width and height of its arch. The small window in the north wall near this arch represents the original means of access to the rood-loft. In the north wall of the chancel is an Early English arch that once opened into a chantry chapel, and in the opposite wall is the later arch of another chapel. In the east wall are three lancets, the central one having a cusped head, and in the south wall is a single lancet, then another, and a portion of a third, forming a couplet, part of which is now walled up. Here, also, are two sedilia and a piscina. Until the year 1864 this church was encumbered with a gallery at the west end, a plaster ceiling, and a variety of box-like pews, when it was greatly improved, out of respect for the memory of the Rev. Thomas Trevenen Penrose, the late honoured incumbent of this parish, as recorded on a brass plate in the chancel, inscribed by the late Sir John G. Coleridge.

(*To be continued.*)

CHURCH BUILDING AND RESTORATION.

Birmingham.—The Wesleyan Chapel in Cherry Street is about to be pulled down. The society, having obtained, after ten years' negotiations with the Improvement Committee, the freehold site at the corner of Corporation Street and the Lower Priory for the purpose of building a new chapel with schools and classrooms, invited several local architects to submit designs in competition, showing how suitable premises for their accommodation could be arranged, with shops for letting on the ground floor. The plans of Messrs. Osborn & Reading, of 13 Bennett's Hill, Birmingham, were selected. The buildings are now in course of erection, and include on the ground floor fronting Corporation Street two large shops, with basements under, and a smaller shop with basement in the Lower Priory. The inclination in the adjoining streets admits of a level entrance from Dalton Street to the basement of these shops. Mr. John Bowen is the contractor.

The Church of St. Saviour, for the Deaf and Dumb, Oxford Street.—The Bath stone dressings of this church are now being restored by the same process that was successful in the church of St. Peter's, Eaton Square, when restored two years ago. If this process is permanent—and there is not the least doubt from the appearance of the front at St. Peter's that it will be—a very valuable remedy has been discovered, especially in cases where the removing of the decayed stones would be dangerous to the structure, and in historic buildings, where the perfect portions can be retained instead of being wholly replaced by new stones. Mr. A. W. Blomfield, M.A., is the architect.

West Croydon.—A Congregational church was opened on July 6. It is Early Decorated in style, and consists of a nave with centre aisle, two side aisles, double transepts, and deeply recessed apse with choir stalls on either side, pulpit on the left, and organ chamber on the right. Externally the church is faced with Kentish rag, with dressings of "Monks' Park" Bath stone, while Farleigh Down stone, relieved with bands of blue Bath, is used on the inside. The nave columns are in Portland, and all the fittings in pitch pine. The building is ventilated by fresh air inlets in walls, and Boyle's extractor in roof. There are spacious vestries at the rear, as well as a large church parlour. The cost of the building has been 10,800*l.*, and great credit is due to Mr. Holloway, of Marmion Works, Lavender Hill, Wandsworth, for the way in which he has carried out his work, and also for finishing the building three months under his contract time. The architect of the building is Mr. W. D. Church, 12 South Place, Finsbury, E.C.

GENERAL.

The Designs by Mr. W. J. N. Millard and Mr. W. G. B. Lewis have been selected by the Committee for the East London Hospital Extension at Shadwell.

The Royal Institute of Painters in Water-Colours have selected Sir J. D. Linton and Mr. Frank Dillon to serve on the committee now being formed by the Lords of the Committee of Council on Education to consider, from an art point of view, the question of the action of light on paintings in water-colours.

M. Charles Garnier represented the Académie des Beaux-Arts at the funeral of the late Cardinal Guibert, Archbishop of Paris.

Captain Douglas Galton, C.B., has been elected chairman of the Council of the Society of Arts for the ensuing year.

A Project for holding a national exhibition of art, science, and industry in Glasgow in 1888 has been referred to a committee for consideration.

Plans for offices for the Edinburgh School Board, prepared by Mr. Wilson, have been finally approved of. The estimated cost is 10,000*l.*

The New Street in Dublin leading from Cork Hill to Christ Church Cathedral will be opened on Tuesday next.

Plans are being prepared by the local architects for a town hall in Stourbridge which is to cost 3,500*l.*

The Renfrewshire Commissioners of Supply have purchased a site for the erection of a police station for Kilmalcolm.

An Exhibition of motors and machine tools, tools and models for small industries, was opened at Stockholm on July 12, and will be kept open until September 12.

A Cottage Home for Girls is about to be erected at Cooden, Sussex, for Lady Clinton, containing twenty-four beds, from plans and under the superintendence of Mr. J. B. Wall, A.R.I.B.A., architect, London.

Messrs. Hawksley & Bateman, the engineers to whom the Leeds Corporation referred the schemes for the Blackmoor Water Tunnel scheme, the original estimate for which was 90,000*l.*, have disapproved of the whole of the schemes proposed, and propounded a plan for a new tunnel to cost from 30,000*l.* to 40,000*l.*, exclusive of compensation to landowners.

The Architect.

THE WEEK.

The sale of the Blenheim collection on Saturday did not approach the anticipated prices. The best pictures had been sold beforehand, and, in truth, it must be said that some of the works which appeared in King Street were more suggestive of the "Slaughter House" than of Christie's. "Blenheim," "presents to the Great Duke," "exhibited at Burlington House," phrases which were supposed to be associated with the humblest work, had more influence than the quality of the painting, and there was something factitious about the smallest sum that was given. Another cause of the low prices was indicated by the *Times* when it was said "there was no M. Gauchez, the great dealer of Paris, and *procuratore* for the American millionaires," at the sale. The average price was therefore only 450 guineas, instead of five times that sum. In many cases the prices were excessive. The most admired picture of the lot was Rubens's *Venus and Adonis*, but it was not worth 7,560*l.*, at which sum it was bought in. It took probably two days to paint. Far finer was the same artist's *Distribution of the Rosary*, a finished study for a larger work which was never painted, and it was sold for 1,585*l.* 10*s.*, that is, about one-fifth the price sought for the *Venus and Adonis*. The extra price was to be paid for size, not for quality. The small copies of pictures which were made by Teniers were curious, as evidence that a painter cannot abandon his own style when he becomes a copyist. Many of them were ignoble translations, and marked the difference in spirit between Italian and Dutch art.

M. Lockroy made some arrangements on Tuesday respecting the Paris Exhibition of 1889. There will be a commission consisting of three hundred members, and which will be divided into twelve sub-commissions. The commission of control will be composed of the representatives of the Municipal Council, the Society of Guarantors, and the Government. M. Lockroy will reserve to himself the functions of Commissioner-General. The direction of works, comprising the erection of the building in the Champ de Mars, the annexes, &c., will be presided over by M. Alphand. The financial department will have M. Grison at its head. The allotment of space and organisation of the interior will be under M. Berger. The commencement of the works on September 1 is to be celebrated by a *fête* at the Champ de Mars and the Trocadéro, for which M. Alphand is to prepare a programme.

The exhibition of the works by the ten competitors for the Prix de Rome in sculpture was opened in the Ecole des Beaux-Arts on Saturday last. The subject is Scriptural, and represents the fright of Tobias when he saw the great fish approaching him as he bathed his feet. The Prix de Rome for painting has been awarded to M. Charles Lebayle, a pupil of M. Cabanel. The subject was *The Proclamation of the Emperor Claudius*. The première second prix was gained by M. Lavaley, a pupil of MM. Cabanel and Maillot; and the deuxième second by M. Sinibaldi, also a pupil of M. Cabanel, whose *atelier* has thus sent forth the three prizemen of this year.

There was only one dissentient to the resolution which was proposed on Tuesday in the Birmingham Town Council, in virtue of which the design marked "Terra-cotta" was to be approved, the authors, Messrs. Aston Webb and Ingress Bell, were to be instructed to make any modification the General Purposes Committee might suggest, and tenders for the erection of the building were to be sought. The fellow-competitors with the successful architects were announced to be as follows:—Messrs. John Burnet & Son, Glasgow (Law and Order); Messrs. Dunn & Hipkiss, Birmingham (Sincerity); Messrs. J. J. Bateman & Hunt, Birmingham and London (Via Una); Messrs. Maxwell & Tuke, Manchester (Two Judges of Assize). It was mentioned by the Mayor that when Mr. Pearson saw Mr. Waterhouse's plans, he said they could not be improved upon, and declined to compete, but they were not adopted. Mr. Waterhouse gave his aid generously, and throughout the business has acted in a manner that was worthy of his position in the profession.

The Building Committee of the Edinburgh Exhibition some time since instituted a competition for plans of workmen's houses, and, to assist them in judging, obtained the aid of Mr. James Sellars, architect, of Glasgow, and of the President of the Edinburgh Architectural Association. For tenement houses the diploma has been adjudged to Mr. J. A. Russell Inglis, of Edinburgh, and for continuous tenements Mr. Alexander Hay is the prize-winner. Mr. William Menzies, of Egham, Surrey, obtained the diploma for double tenements. As there was no financial reward and no certainty of a commission from the competition, very few designs were submitted.

The removal of the galleries in the parish church of Stratford-on-Avon was commenced on Monday. They were erected about fifty years ago, and were of oak, with carved fronts. Several of the townspeople were in favour of their retention, but the vicar considered they interfered with the appearance of the church, and he was supported by the Society for the Preservation of Ancient Buildings. The restoration, which will cost 12,000*l.*, is directed by Messrs. Bodley & Garner.

The failure to obtain a sufficient number of subscribers for shares in the proposed Manchester Ship Canal is another instance of the want of enterprise which is paralysing English industry in most of its forms. The projectors of the canal had succeeded in obtaining their Act after one of the stiffest contests recorded in the annals of Parliamentary Committees. But the opposition of the powerful railway interest was not abated. All sorts of suspicions about the success of the scheme were kept afloat. It must be admitted that Manchester did not appear to show its old energy in supporting the canal, and it was easy to say there was no belief in the City or in Lancashire that the works would be ever completed, or that they would pay. The tactics of allowing only a short time to obtain subscribers hardly seemed prudent with so large an undertaking. Whether there is an end to the canal, or no more than a delay of a year in starting, has yet to be discovered. The arrangements with railways do not appear to be satisfactory, and temporary concessions may be made which will remove the complaints of Lancashire manufacturers. If so, there will be difficulty in reviving the scheme. At one time it was supposed to be impracticable: that allegation was disproved. It is now said to be unremunerative, and that is more difficult to refute than all other charges combined.

At the last meeting of the French Academy of Sciences, some photographs were presented which were taken at great heights by MM. Tessandier and Nadar. On one occasion they operated when their balloon had reached a height of 800 mètres, or about half an English mile; another time the height was 1,150 mètres. The district over which they sailed extended from Paris to Mans. The views of Versailles, Sèvres, and some other towns were on an exceedingly small scale, but could be recognised.

The Benchers of Lincoln's Inn have granted the use of Lincoln's Inn Hall for the meetings in connection with the Royal Historical Society's commemoration of the 800th anniversary of the completion of Domesday Survey. The meetings will be held from October 26 to 30 next. At the same time there will be an exhibition of manuscripts relating to the subject at the British Museum, and another at the Public Record Office. It is hoped that the owners of all suitable manuscripts will follow the example of the Dean and Chapter of Canterbury and the Society of Antiquaries, by agreeing to lend their treasures for exhibition at the British Museum, the Principal Librarian having consented to take charge of any documents that may be sent to him for the purpose.

THE NATIONAL COMPETITION PRIZE WORKS.

WE suppose it was no more than just that the schools of the Science and Art Department should, like the French Salon and the Royal Academy, have a year marked by a dearth of remarkable works. Whatever is the cause, the exhibition which is now open hardly comes up to the average standard. Whether the judges have selected the best of the works submitted by the schools it is impossible to determine, but since it must be evident to every impartial observer that the prizes have been distributed in a haphazard way, it is allowable to imagine that the selection was determined in a similar fashion. If the relative merit of a few works could not be decided so as to give general satisfaction, how much greater was the difficulty when some hundreds of thousands had to be considered?

It is characteristic of the foresight of the authorities that when it was resolved to exhibit the works of the National Competition no provision was made for a place to hang them. This year they appear in the old Patent Museum. The shed is badly lighted; from want of space the drawings have to be hung on screens a few feet apart, so that it is impossible to judge of the paintings, and as some officials are engaged close by, the visitor will find (unless an alteration is made) that he has to make his examination with an accompaniment of snatches of comic songs, whistling, jokes, and laughter. It is apparently necessary to allow a good deal of relaxation during office-hours in the museum, but there is no advantage in an ostentatious display of the enjoyment.

This year more latitude is allowed to the students who contribute architectural drawings, and in consequence several ambitious works are to be seen. The gold medal is gained by F. W. WHITWELL, of York, for designs for a cathedral church. The drawings are all executed in a workmanlike style, and with uniformity of line throughout. The crockets are indefinite, and this is the more remarkable, as the same student has elsewhere a frieze which is a good specimen of free-hand drawing. The style of the cathedral drawings would serve in an office, but as much cannot be said for the drawings of a college by H. TOOLEY, of Great Yarmouth, which are suggestive of the amateur in the attempt to make the lines as fine as engraving. But we suppose in this case it was the painstaking of the designer which was rewarded. A builder would not approve of the drawings. PERCY ADAMS deserved the silver medal for his set of measured drawings of St. Margaret's, Ipswich. They are much better in style than those of the Bute Chapel, Cardiff, by D. CAPLE, which obtained an equal reward. J. E. BYGATE has a carefully tinted drawing of a bay of Durham Cathedral. The design for law courts, by A. ERSKINE, of Manchester, shows, as commonly happens, better draughtsmanship in the exterior than in the sections. It is Gothic; but the premiated designs for a school of art, by J. A. PEARCE and F. STEAD, are both Italian. The South Kensington School appears to be tested in all sections by a more severe standard than is applied to the other schools. The drawings of a part of the museum, by A. C. JAHN and C. STOLLE, were deserving of a better recompense than bronze medals, for the colours as well as the details of the original are suggested without any of the garishness that is so often found in tinted views. There are not many prize drawings representative of the style that now prevails. M. BUCKMASTER'S building in red brick wants repose, and the good parts suffer from the attempt to introduce a variety of quaint forms. E. C. MAIDMAN has a fair country vicarage. The gates by J. TREGO, of Coventry, are deserving of commendation.

It is evident from the drawings that while there is an attempt to attain a common character in the painting, drawings of the figure and modelling, a student can follow his own inclination when he works at architecture. This is the consequence of the training received by the teachers. The masters in general cannot claim to be architectural draughtsmen, and all they are able to do is to offer occasional suggestions or criticisms to the students. The majority of the architectural drawings are therefore less representative of the Departmental teaching than of practice of some kind in an office. The student may work in a school during the evening, but his instruction has to be obtained elsewhere. It is useless, therefore, to attempt any general observations on the architectural drawings, for we can only find two which have any similarity in style.

The number of examples of modelling appears to increase every year. One of the gold medals was awarded to W. PARKER, of Lambeth, for a panel having a good deal of Renaissance character. The subject is VENUS rising from the sea. The goddess stands in a shell; her hands are raised to her head, and she is surrounded by mermaids and dolphins. She has a more doleful look than becomes VENUS, and the limbs are not well modelled. It might also be objected that the attendant figures are more conventionalised than is requisite. But a Classical subject is so difficult that shortcomings may be excused. Another student of the Lambeth School, W. ROLLINS, obtained a gold medal for a draped *Venus*. It is a pity the figure has not been cast in bronze, for the drapery has the character that is adapted for the material. This is, in our opinion, the most complete figure in the exhibition. A copy of the figure of a boy extracting a thorn from his foot, by H. GAMLEY, of Edinburgh, wins the highest prize for that class of work, and it is a very close copy of a difficult subject. A fourth medal is awarded to D. TONELLI, for his vigorous and realistic figure of a martyr. The Plasterers' prize was never to our knowledge more fairly won than by the relief, *Commerce*, of which J. CASSIDY, of Manchester, is the author. In this case Enterprise is at the prow of a raft and Capital at the helm. The cupids who sail upon the bosom of the air may stand for patrons of Enterprise. Commerce, with her attendant nymphs, are the passengers. The composition has the charm of one of STOTHARD'S designs. Over it is a large frieze or cornice, by J. CROMPTON, of South Kensington, which is worthy of a better prize than a book. It is made up of grapes, squirrels, and birds, all treated in a masterly way. On the same wall is a well-modelled reclining figure above an arch by ANNA DABIS, of the South Kensington School; a companion figure, but not quite as successful, is by W. H. GATES. They are both creditable works. On one of the screens are some designs for the Plasterers' prize. The silver medal was awarded to ETHEL ELLERLY, of which the subject is children bringing home wood in winter. R. A. MILLER'S *Dance of Shepherds* shows more power, but was rewarded with a bronze medal. Lambeth School, in addition to gold medals, carried off two in silver for figures by W. TAYLOR and C. ALLEN.

In what may be called industrial sculpture, the lock furniture by W. FREETH, of Birmingham, takes first place and the gold medal. The wax model appears to have suffered in transit, for the faces of the figures have not the expression that is needed. Much fancy is seen in the little figure near the keyhole and in the boy on the top of the door-handle. The ornament is kept rather flat, and is well adapted to the space it occupies. F. TURNER, of Sheffield, gains a silver medal for two plaques, with flowers in low relief, which show great facility in execution. J. BAILEY, of Hanley, has two excellent vases, which would seem to be adapted equally well for wine-coolers or flower-pots, according to the material. The three handles are formed of figures, and a band of figures in relief runs around beneath the brim. They are also examples of works which are inadequately rewarded. The candlestick, by H. S. PEPPER, has a good contour, and the ornamented and plain portions are carefully balanced.

A concession is made to English susceptibilities by enclosing the studies from life with red curtains. West London has been fortunate in the studies in oils. The gold medal is bestowed on E. TAYLOR'S figure of a woman, although the lower parts of the legs seem out of proportion; and a silver medal on W. DODSON'S study. Liverpool takes two bronze medals and Leicester one. The South Kensington School has only a bronze; why is not clear.

The gold medal for a chalk study is obtained by H. FRIPP, of Bristol. The figure is well drawn, but as it is shown in profile there was much less difficulty in the representation than in those from South Kensington, by J. M. DUNLOP and A. FISHER, for which silver medals were received. The figure by E. ANDERSON, of St. Martin's, is also better, and it gains a book. There is a good deal of style about some of the studies by female students from

South Kensington, such as M. Clarkson's in the enclosure. The portrait in oils, by W. H. Knight, of Birmingham, in spite of its merit wins only a silver medal—the unfinished hand was probably detrimental to him. He also receives a bronze medal for his study of drapery. We are inclined to place the two in the foremost place of their division. Jeannie Moore, of Croydon, is rewarded by a silver medal; but her portraits of women are not equal to those of Indian men or models in Indian costumes. Attention should be given to the fine portrait in chalk of a girl, by L. Muckley, of Birmingham, which is entitled to the silver medal awarded, and to the two heads by M. Lazarus, of the West London School. There is a very good head by A. Inglefield, of South Kensington. *The Wrestlers*, by G. Graham, of Glasgow, is the best of the monochromes from the cast, but it is not served in its position by the lighting of the room.

The paintings of still life this year form an interesting series. A. Baker, of Northampton, obtains a silver medal for a group which is composed of a geranium in pot, standing in front of a canvas strainer which rests against a slab of the Parthenon frieze. The two paintings of game, by Janetta Pitman, of Nottingham, are freely treated, and have none of the stiffness of posing generally seen in works of the class. J. M. Comley, of Coventry, deserved a better reward than he received for his group, which is rather original. It is made up of a butcher's block, on which rest a blown bladder and some hooks, and against the wall hangs a blue smock. Anything that might appear repulsive is avoided. A French student would not miss the opportunity of gaining colour by sprinkling the block with blood. The ornament by M. Rollason, of Birmingham, is painted in a careful style. The Chiswick School has been exceptionally successful this year in gaining several prizes for still life, although the subjects selected seem rather difficult. Japanese cabinets with aventurine doors and inlay, fans, ribbons, vases, books, daggers, damask, &c., are elements that afford rather hard tests for students. A. Rickman, R. Hammond, M. Dickson, and F. Mackenzie are among the students rewarded.

Flower painting should receive much attention in the schools, and this year that class of work is fairly well represented. E. Birks, of the Stoke School, carries off the gold medal with his four fine water-colours, but the colour is in one at least not equal to the drawing. F. Shindler, of the Bloomsbury School, runs him close, with drawings of birds and flowers. J. Phillips, of Nottingham, has a good painting of chrysanthemums against a delicate blue background.

The landscapes are interesting, and most of them seem out-of-doors work. A bronze medal is gained by G. Henton, of Leicester, for two sketches, but one of the subjects is not well chosen. H. Baynton's sketches in oil are carefully finished, but the subjects are comparatively easy. The clearest indication of possible power as a landscapist is seen in the drawings of J. Inskip, of Scarborough. He is one of the few students who should be advised to follow art as a profession. His group of still life, a skull and books under lamplight, is rather sensational, but also proves skill.

The designs for applied ornament are better than usual, and the influence of Indian work is seen in many among them. In the competition for the Owen Jones prize a silver medal is gained by J. Fletch for a textile pattern. The most ambitious work of this class is by S. Mawson, of Manchester, in which animal as well as plant forms are utilised. There is a good design for a carpet by M. Jones, also of Manchester. Among the designs for pottery the design of F. Drake, of Hanley, should be remarked. The figures forming the handles are excessively elongated, and there is a want of finish in some of the painted figures, but there is spirit in the work. Near it are some sketches from "Hiawatha," by A. Fisher, of South Kensington, which are marked by pictorial power.

The drawings suffer from the character of the building in which they are hung, and justice could hardly be done if the works were examined there. As the exhibitions are the best evidence of what is being done in the art schools under the Department, it is indispensable that arrangements should be made for seeing the works under a sufficient light. In a fitting gallery the drawings might appear much better than they do now.

JEAN LAMOUR, BLACKSMITH.*

EVERY man and woman who was taught French in the days when the "Charles XII." of Voltaire was supposed to be a better model of the language than cuttings from newspapers, can recall the name of Stanislas Leczinsky, the young palatin of Posnanie. What was a palatin and where was Posnanie were not perhaps very clear, nor were matters mended by saying he was woywode of Posen, but there was little difficulty in forming a mental picture of the young prince as he appeared as a deputy before the young conqueror who could place the crown of Poland on any head he selected. In Poland, according to the historian, the people were in the happy position of being able to speak Latin without undergoing a course of bodily suffering, and it was in that language Stanislas addressed the king. Charles after the interview declared that the palatin was henceforth his friend, and the Poles naturally interpreted the words to mean, "Behold your future king." An attempt was made to alter the resolution of the Swedish monarch on the ground that Stanislas was too young for the office, but Charles cut short all cavils of that kind by replying that the palatin was about the same age as himself. In less than a week Stanislas was formally elected king of Poland.

Augustus, who possessed the crown before the Swedish invasion, was not disposed to peaceably recognise the new monarch. As soon as Charles left Warsaw he attacked his rival, and Stanislas fled to his protector. In a short time the Swedes prevailed, and eventually Augustus was compelled to write a letter of congratulation to the woywode who dispossessed him.

The strange history of Stanislas cannot well be condensed into a paragraph or two. He held on by Charles until fortune turned against his protector. Then he had to give up his throne to the pertinacious Augustus, and settled down in Weissenberg, where he led the life of a country gentleman, and, having abundance of money, was a good deal happier than he had been in Warsaw. In course of time a wife was needed for the young King Louis XV., and the people in the French Court who managed affairs of that kind selected the daughter of Stanislas for the dignity. This brought him again into notice, and when the King Augustus died it was not unnatural that Stanislas should once more seek to ascend, or be forced to seek, the Polish throne. But the world had greatly changed between 1704 and 1733. He was opposed by a Russian army, and was compelled to fly to Dantzic. He was besieged, and when there seemed no hope—for a price had been placed on his head, and the promised troops from France did not appear—he was compelled to escape in the guise of a cattle-dealer.

If Stanislas had been master of his fate he would probably go back to his quiet life and build pleasant country houses for himself. But hitherto he was a puppet in the hands of abler men, and it was necessary to use him once more in that capacity. The siege of Dantzic was considered by France to mean mischief. A league between Russia and Austria was suspected, and as the Duke of Lorraine was supposed to be friendly with Austria, his province was seized. Stanislas was selected to be the ruler, but with no more than a life tenancy in it; for after his death Lorraine was to be united with France. It was also agreed that he was to retain the title of King of Poland.

It may be asked what all this has to do with Jean Lamour. History makes odd combinations, bringing great men and humble men together, and if it were not for Stanislas and the vicissitudes which wafted him to Lorraine, the honest blacksmith of Nancy must have remained unknown, like a great many thousands of his craft, in all ages.

Stanislas acted on the belief that the king was the father of his people, and he resolved that his subjects in Lorraine should have no reason to regret the coming of a stranger among them. He was by nature possessed of a kindly disposition, and, like the Vicar of Wakefield, took pleasure in seeing happy human faces about him. Being a wise man, he thought that one of the best ways to make the

* *Les Artistes Célèbres: Jean Lamour, Serrurier du Roi Stanislas à Nancy.* Par Charles Cournault, Conservateur du Musée Historique Lorrain, à Nancy. Paris: J. Rouam. London: Gilbert Wood & Co.

people happy was by giving them a pleasant capital to live in, and he therefore set about improving Nancy. JEAN LAMOUR was one of his instruments.

Like his father, JEAN LAMOUR was the *serrurier*, or smith, of Nancy, receiving as a retainer about two shillings a year. He was not content with the training he received in his father's forge, and, to gain wider experience, he worked in Metz and even in Paris. When his father died JEAN was twenty-two, but he was considered qualified to obtain the post of *serrurier*, with its retainer of 2 francs 60 centimes. There are records which show that he was entrusted soon afterwards with municipal works, such as making lamps and screens. He was also charged with preparations for the fireworks to celebrate the entry of FRANCIS III., who was the last of the native Dukes of Lorraine. The smith was a man of about forty years when King STANISLAS came into possession of Nancy.

In the documents by which the province was leased it was stipulated—so strong was etiquette in those days—that neither the king nor his wife was to be interred in the mortuary chapel of the august Dukes of Lorraine, which is in the Church of the Cordeliers. In the beginning of his reign STANISLAS, therefore, had to make provision for some place to be buried. He selected the chapel of Nôtre Dame de Bon Secours. It was a memorial of a victory gained in 1477, by which the independence of Lorraine was secured; but in 1737 it was a ruin. STANISLAS rebuilt the chapel, and his first commission to JEAN LAMOUR was for a screen to be placed in it. This work has disappeared. It was sold to a broker during the first Revolution, and, although the smith published engravings of his works, the screen is not included among them. M. COURNAULT suggests that it may have resembled the communion rails and balcony of the organ-loft which still remain in the church. They bear the arms and ciphers of the king and the queen. The style is, however, more simple than is found in the later works of LAMOUR. Like all artists he did not reach perfection in his early efforts.

The example of LOUIS XIV., who preferred a palace in the country to one in town, was not lost on STANISLAS. He began with a house in the village of Chanteheux, which no longer exists. It was designed by an architect named HERÉ, who also designed the palace for the king, which is now utilised as a cavalry barrack, at Luneville. The iron work that remains in the latter building reveals to us that LAMOUR was then an out and out representative of the style of Louis XV. He avoided straight lines and introduced as many curves and as sudden changes in them as the material would allow. We can understand the courtiers from Paris expressing admiration for the work which might have been wrought by an artificer in the city. Subsequently he seems to have had the benefit of wise counsel, for he introduces straight lines, and in addition to the contrast an expression of strength is imparted to the work which otherwise would be impossible. In the Georgian gateways that are still to be seen here and there in the suburbs of London, we have iron work that bears some resemblance to LAMOUR's, but the English work is not so elaborate as the screens, staircase railings, and lamp brackets of Nancy. It is remarkable that in some cases LAMOUR's engravings represent work that is even more elaborate than the executed examples.

In the town, according to M. COURNAULT, several examples from LAMOUR's forge still survive, in addition to the great screen in the Place Royale known to all tourists. In the Maison des Missions, where the king used to lodge occasionally, there is a great balcony on the garden front, and a staircase railing. There is also a screen in the bishop's palace. The museum contains a screen that was taken from a barrack after a fire in which it suffered. The Tribunal de Commerce and the theatre, which was formerly the Collège des Médecins, have work by LAMOUR.

It is remarkable that STANISLAS paid for ironwork which was intended for private houses. M. COURNAULT quotes an entry from the treasurer's records, showing how 3,508 livres had been paid to LAMOUR for "ouvrages en araignées" for houses in the Place Carrière, and evidently referring to screens of a delicate character. There are many of them in Nancy. The best is one which belonged to an hospital gate, but the owner has had it framed as an ornament for his apartment.

The work on which LAMOUR's fame mainly depends is the series of screens in the Place Royale of Nancy, now the Place Stanislas. This is an architectural composition, and M. COURNAULT is of opinion that the entire credit for it should not be given to the smith. HERÉ, the architect and director of works to the ex-king of Poland, must have prepared the design, although his name is not associated with the screens. This, however, is not an exceptional case, for in every country in Europe there are buildings which testify to the transitory nature of an architect's fame, and a good many French architects therefore wisely have their names inscribed on their buildings.

The Place Stanislas is a rectangle, measuring about 410 feet by 345 feet, with an approach at each angle. There are three other streets leading to it. On one side is the Hôtel de Ville, and the two openings at the ends have screens with pilasters, capitals, cornices, vases, lamps, &c., of iron. The angles which are opposite have screens with three openings in which are fountains. The figures of NEPTUNE, nymphs, cupids, &c., were sculptured by BARTHÉLEMY GUIBAL, who also modelled the bronze statue of LOUIS XV. which stood in the Place Stanislas prior to the Revolution. It may be said that the Place is unique in suggesting how much may be made of ironwork as a means of architectural decoration. Trees were planted behind some of the screens, and the dark green is an effective background to the gilded ornamentation. The work is throughout executed with precision, and we fancy many tourists set little value on it, believing that the gates are no more than examples of casting. LAMOUR was a true craftsman, and he was as anxious about the joints of the pieces constituting one of his works as about the general design. In ornamental ironwork of the period shakiness is not uncommon, but it appears to be absent from the examples produced by LAMOUR.

STANISLAS must have derived much pleasure from the work. The title-page to the book, "Recueil des Ouvrages de Serrurerie de Jean Lamour," contains a representation, after a picture by BÉNARD, of a visit by the old king to LAMOUR's forge. As the smiths have not suspended their operations we may assume that the visits were so common as to excite no surprise. The people of that time were fond of making titles for their rulers. The son-in-law of STANISLAS was known as LOUIS LE BIEN-AIMÉ; the ex-king in Nancy was called STANISLAS LE BIENFAISANT. That title was probably inspired by some member of the building trade, for STANISLAS transformed Nancy. Archæologists have since deplored his demolitions of old buildings, but the inhabitants of the town seem to have thought only of the money which he expended, and apparently without laying a heavy burden on them. He was a philosopher of the eighteenth-century species; but with him projects for universal amelioration were more than graceful literary essays, and, during his reign of nearly thirty years, he did his best for the people about him. One cannot help regretting that the old patron of the arts had not had an easier death. His dressing-gown caught fire on a February night, and the injuries he sustained were too much for the constitution of a man of eighty-six.

With his death Nancy ceased to be a capital, and, under French rule, there were no commissions for big screens. Fortunately for himself JEAN LAMOUR was wealthy, and he was able to amuse himself by having ironwork made for his own houses, which would be worthy of a palace. It was also a satisfaction to produce a volume of his designs. He was a notability in Nancy. The lawyers were proud to elect the honest smith to be a member of their confraternity of St. Yves, and a man who wore the costume of a gentleman of the court—"habit et veste de velours bleu de ciel, galonnés d'or"—was not likely to be a discredit to the meetings. He died in his seventy-third year, and the tomb of the maker of memorials was so humble that it cannot be discovered. His name has been given to one of the streets in Nancy; but, as long as his own screens, balconies, and railings last, the memory of JEAN LAMOUR must survive among his townsmen.

The collection of engravings of LAMOUR's ironwork, which appeared in 1767, has long been scarce. Some of the plates may now and then be picked up in the portfolios on the Paris quays. In 1857 a lithographed copy was published in Nancy. M. COURNAULT's biography contains

reproductions of twenty-four subjects from the original engravings. His book, therefore, will give students an excellent idea of Lamour's work, which was one of the most characteristic types of the style in vogue in his time. It is a style which still finds favour, especially in French ironwork. We are glad to see a biography of the kind among the series of "Artistes Célèbres." The caste principle is too generally accepted by the writers and publishers of artists' lives. A painter or sculptor who produces mediocre works is recognised; a metal-worker like Lamour is treated as if he were no better than the man who blew the bellows in the forge. The catholicity which inspires the series issued by the Librairie de l'Art is seen in the selection of subjects. Artists of all nations are included, and the biography of Lamour suggests that niches also await the artist craftsmen of Europe.

PENSHURST PLACE.*

By S. W. Kershaw, F.S.A.

AMONG the many houses for which Kent is so famous, Penshurst claims one of the foremost rank. Its situation in a noble park, with fine timber, and near a village possessing some interesting remains of domestic work, attracts many an art lover, and certainly forms a most suitable visit for an architectural society.

We may first notice that in these inland houses there was always an idea of defence; in those buildings nearer the coast, as at Saltwood Castle, Lymne, and Westenhanger in this county, stronger fortifications appear.

Penshurst has been so frequently connected with the Crown that its annals form a part of the history of England, and as an example of the connection of history and architecture, it has a vivid and general interest for us all. A house of importance is said to have been here in the time of the Conqueror, and I understand there are a few remains in the outer walls of that period. The family of Penchester inhabited the domain for two centuries after the Conquest.

In the time of Edward III., Sir John de Pulteney became possessed of Penshurst. The church of St. Laurence Pountney in London is said to have been founded by him. We read in the 15th Edward III. of the first license to crenellate or fortify this house. This method of defence is seen at Hever Castle, Cowling, &c., and was a common way of adding to the security of a Mediæval abode. To "crenellate" is a technical term to embattle, and the records or licenses to crenellate are generally found among the papers of the Public Record Office.

The estate of Penshurst reverted to the Crown in the time of Henry VI., who granted it to the Duke of Buckingham. It was again forfeited, and subsequently given by Edward VI. to the Sidneys. While in their possession, Penshurst entered on its most eventful annals, for Sir Philip Sidney, the hero of Zutphen, who was killed at that battle in 1597, was born here. Sir Philip's sister, Mary, is commemorated in the following well-known lines attributed to Ben Jonson:—

> Underneath this marble hearse,
> Lies the subject of all verse,
> Sidney's sister, Pembroke's mother.
> Death, ere thou hast slain another,
> Learned, good, and fair as she,
> Time may throw his dart at thee.

The long avenue walk in the park, still known as "Sacharissa's Walk," commemorates the name of Dorothy Sidney, the "Sacharissa" of Waller's poems. Her brother, the celebrated Algernon Sidney, was beheaded in 1683. The present noble owner of Penshurst, Lord de l'Isle, is descended collaterally from this family.

Having passed in rapid review the manorial history of this place, I now touch on some of its architectural features, and remark that most antiquaries and critics have agreed in classing Penshurst as a nearly perfect example of a gentleman's house about 1491, and valuable as illustrating the manners and customs of that period. The plan of the building is an irregular square. The principal entrance is on the north front in the park, and this approach has some resemblance to its neighbouring rival, Knole. The buildings are very extensive, surrounding an irregular court or quadrangle, and of different dates and styles. Entering this court we come to the hall, the most unaltered part of the house, having an open timber roof of much beauty.

I may here remark on the wealth of timber roofs, both of churches and houses; of the former especially in Norfolk, and of the latter in almost every county in our land. While we rarely, if ever, find this roof in France, it is abundant in England, a study of itself alone, and one of the chief characteristics of our island architecture.

The windows of this hall, with decorative tracery—technically known as "Kentish"—are worthy of much notice, and should be compared with those at Leeds Castle, Kent, and Mayfield, Sussex. The music gallery is perfect. This, one of the features of every Mediæval house, has formed the theme for the pages of an historical romance,* of which the hero of the story (one of the Sidneys) speaks as follows:—"'Tis a fine old hall, is it not?' he said, looking around the white walls, with their groups of armour. 'Yonder, in that black gallery, the minstrels played on high days and holidays, and through those archways beneath I can well remember seeing the mummers on a winter's night.'" Thus we perceive the use and realisation of these homes of our ancestors, their quaint memories making them a picture of much interest, recalled to us in the illustrated works of Nash, Richardson, Neale, and others. Under the music gallery was the passage called the "screens," and at the opposite end of the screens another doorway with a panel of later date. There are the usual doorways leading to the buttery, pantry, &c.

One special feature of the hall is the original hearth and fire-dogs, and the louvre for the smoke to ascend. The fashion of having fires in the centre of the hall remained long after chimneys and fireplaces had been introduced. This, like many other such customs, are forcibly illustrated in our Mediæval houses, which really became the exponent of life, manners, and habits of the sixteenth century.

At two angles of the hall, at one end externally, were probably towers, one of which remains; they were useful for defence, and were also at times inhabited. The daïs, or raised platform, was used in this hall. The domestic chapel cannot be traced, which is always such a noted feature in these houses, and is well exemplified in the neighbouring structures of Ightham Mote, Knole, Groombridge, &c. So much alteration has taken place at Penshurst, that this—the chapel—is one of the parts which has unfortunately been involved in the change.

Several portions have been built or added by the respective owners. Thus John de Pulteney, to whom I have made reference before, built a great part of Penshurst about 1350; a large wing was added about 1390, agreeing in architectural character with the work of the time of Richard II. Sir Philip Sidney also enlarged Penshurst, in building wings and the gate-house, also the portion called the Long Gallery. The age of the existing work is, in many cases, to be traced by the arms of the Sidneys, which are visible in many places.

Leaving the hall, we find rooms of great interest and beauty, ornamented with tapestry, paintings, and rare china. One room is entirely hung with tapestry, which represents the triumphs of Ceres, Æolus and the Winds, &c. The main apartments are six in number, and Horace Walpole said, in 1752, "they are the grandest I have seen in any of these old palaces." The Great Gallery has portraits of John Dudley, Duke of Northumberland, by Holbein; Mary Sidney, Countess of Pembroke, by Marc Gerrard; Sir Philip Sidney, by Zucchero; Archbishop Abbot, by Holbein; others of Milton, Lady Jane Grey, &c. Disposed throughout the rooms are pieces of rare furniture, old Venetian glass, and a work-table, said to have been embroidered by Queen Elizabeth, whose portrait is also here. There are several other historical treasures associated with royalty and the successive owners of Penshurst—the chandeliers, said to have been brought from Leicester House in London, and used when Elizabeth visited Penshurst.

In every part of this mansion, history, architecture, and art play their part, recalling incidents and making an *ensemble* not easily forgotten. These artistic surroundings have been made the vehicle for literary notice more than once in the pages of the charming romance I have before quoted, but I cannot forbear to add the writer's description of the gallery, "as filled with mellow sunset light, gilding the polished floor and the wainscotted walls, lighting up the portraits, the high-backed chairs, and carved tables laden with great China vases."

You will now have formed some idea of the extent and beauty of Penshurst, its different portions offering many points for the study of domestic architecture, which, though having general defined principles, always retains local and county differences, so valuable for criticism.† While examining such a building by the eye, or making sketches, all very important in their way, we cannot forget to engraft on our studies the close perusal of such a work as Parker's "Domestic Architecture of the Middle Ages," which treats exhaustively on the subject.

In leaving the classic ground of Penshurst (for truly such it may be called), which has afforded description for the "Arcadia" of Sir Philip Sidney, and in hastening away under the noble avenues of its park, we too can find a response in

* Read at a meeting of the Architectural Association at Penshurst, July 17, 1886.

* *In the Golden Days.* By Edna Lyall. 1885.

† Some of these notes have appeared in my pamphlet, *Famous Kentish Houses.* 1880.

the words of the writer before quoted by me :—"One more look at that noble front, those battlemented towers; one more look at the great doorway visible between the beech-trees."

TESSERÆ.

Pugin as an Architect.

B. FERREY.

HIS best works, perhaps, are the church at Cheadle, which he built for Lord Shrewsbury, and the church in St. George's Fields, London. The former, however, though a beautiful design, is over-decorated in proportion to its scale; and the latter, with several grave faults, has never been finished externally, while its interior has been fitted up in a manner quite opposed to all its designer's principles of church arrangement. Both these buildings—and it is the same with all his other works—show Pugin's chief weakness: the design is on too great a scale for the actual dimensions. We could point to modern churches which, though insignificant in area, give an effect of height and breadth which approaches the sublime. This is the touchstone of the highest architectural art; it is quite otherwise with Pugin's churches. The actual structures require to be magnified at least 50 per cent. to give the proper effect to the design. As a mere architectural draughtsman, Pugin was unrivalled, but the glorious visions which he delineated on paper dwindled into mean proportions when they were translated into brick and mortar. No doubt this was owing partly to his peculiar training as a scene-painter for the theatres; but he never forgave the friendly criticism which pointed out the difference between the promise and the performance of his designs. Any one may test for himself our present criticism of his style of drawing who will try with a pair of compasses the very beautiful perspective of the St. George's Fields Church, as originally proposed by Pugin. Allowing the moderate tallness of 5 feet 8 inches for the priest at mass, the height of the central boss of the apse groining will be more than 75 feet from the raised steps of the altar. So that, we repeat, the genius of Pugin will not be fairly judged by the actual buildings which he has left behind—unless, indeed, by the unpretending, and therefore much more satisfactory little church which he built at his own cost, adjoining his own house on the West Cliff at Ramsgate.

Rules for Restoration.

SIR G. G. SCOTT.

1. I have found it in some degree useful to have a code of rules and suggestions drawn out and lithographed for the guidance of clerks of the works and builders who are engaged in restorations. But they are of little use, unless constantly pressed personally upon the attention of the parties concerned. 2. The great enemies to careful restoration are contracts. The best course would be to carry them out by day-work, feeling one's way in the most timid and careful manner, and always striving to do as little as is practicable. When contracts are necessary, a series of small contracts is better than one general one. 3. It is highly desirable to avoid uncovering a roof all at once. When re-roofing or re-covering the roofs is necessary, it is best to do it in small parts, and keep the rain out by temporary expedients as you go on. 4. It is often the case that the exterior of window tracery is hopelessly destroyed, while the internal half remains sound. In such cases I hold the proper course to be the renewal of the outer half alone, attaching the new work by plugs and cement. We thus retain one-half in its original form, and insure the correctness of the other half. 5. Patching and piecing, if done carefully, are infinitely preferable to more wholesale renewal. The various cements which we have at our command enable us to introduce the smallest pieces into decayed or mutilated mouldings, which was formerly impracticable. Where the injury, however, is unimportant, it is better to leave it untouched. 6. Never trust a clerk of the works or any unpractised hand to obtain the sections of mouldings, or the forms of other features to be restored. It is often difficult enough to persons whose eyes and whose instincts have been sharpened by the habit of studying ancient features through a long series of years; to those who have had no such advantage it is simply impossible, and one need not be astonished to find them, even with nearly perfect copies before them, producing forms scarcely resembling the original at all. I have often known them, even when they have passed a saw-curf (according to their somewhat barbarous custom) through a moulding, and ruled off its section, produce a result totally at variance with the old moulding. 7. Where an ancient feature has been destroyed, never attempt its restoration till the parts round where the original existed have been thoroughly opened out and explored, and, where possible, in your own presence. Old fragments are in such cases nearly always discovered, and usually in great abundance and near their proper sites. Thus, fragments of a destroyed window are usually found in the wall which blocks up or surrounds the old opening. Blocked up niches, sedilіæ, or piscinæ commonly contain each their own *débris*. Often, however, these are not quite sufficient to perfect a design, and the skill of the architect is taxed to the very utmost to judge what the rest would be. This resembles the labours of the palæontologist, who reconstructs the skeleton and the animal from a few broken bones, and, as in his case, the work is impossible to any but one thoroughly acquainted with his subject.

Tests of Iron.

D. KIRKALDY.

The breaking strain does not indicate the quality, as hitherto assumed. A high breaking strain may be due to the iron being of superior quality, dense, fine, and moderately soft, or simply to its being very hard and unyielding. A low breaking strain may be due to looseness and coarseness in the texture, or to extreme softness, although very close and fine in quality. The contraction of area at fracture, previously overlooked, forms an essential element in estimating the quality of specimens. The respective merits of various specimens can be correctly ascertained by comparing the breaking strain jointly with the contraction of area. Inferior qualities show a much greater variation in the breaking strain than superior. Greater differences exist between small and large bars in coarse than in fine varieties. The prevailing opinion of a rough bar being stronger than a turned one is erroneous. The breaking strain and contraction of area of iron plates are greater in the direction in which they are rolled than in a transverse direction. The breaking strain of steel, when taken alone, gives no clue to the real qualities of various kinds of that metal. The contraction of area at fracture of specimens of steel must be ascertained as well as in those of iron. The breaking strain, jointly with the contraction of area, affords the means of comparing the peculiarities in various lots of specimens. The breaking strain and contraction of area of puddled-steel plates, as in iron plates, are greater in the direction in which they are rolled; whereas in cast steel they are less. Iron, when fractured suddenly, presents invariably a crystalline appearance; when fractured slowly, its appearance is invariably fibrous. The appearance may be changed from fibrous to crystalline by merely altering the shape of specimen so as to render it more liable to snap. The appearance may be changed by varying the treatment so as to render the iron harder and more liable to snap. The appearance may be changed by applying the strain so suddenly as to render the specimen more liable to snap, from having less time to stretch. Iron is less liable to snap the more it is worked and rolled. The "skin" or outer part of the iron is somewhat harder than the inner part, as shown by appearance of fracture in rough and turned bars. In the fibrous fractures the threads are drawn out, and are viewed externally, whilst in the crystalline fractures the threads are snapped across in clusters, and are viewed internally or sectionally. In the latter cases the fracture of the specimen is always at right angles to the length; in the former it is more or less irregular.

English Mediæval Altars.

T. E. BRIDGETT.

In his description of the consecration of Ripon by St. Wilfrid, Eddi gives special prominence to the high altar—"the altar together with its supports was consecrated to the Lord, and then decked with a purple covering interwoven with gold," before the holy mass was offered. Here Eddi distinguishes between the altar-table itself and the substructure on which it was laid. The latter could be a solid mass of stone or wood, or the altar-slab might be made to rest on one or more pillars, or on brackets. The side altars, built against pillars or in oratories and recesses, were often very small. The shape was sometimes square, but more generally an oblong parallelogram, as at the present day. Superaltars, *i.e.*, the step or steps at the back of the altar (*gradini*), were not in use; and the name superaltar in Mediæval documents is to be understood of a portable altar-stone. Whether movable or fixed, the altar-slab, or altar properly so called, was regularly of stone, and, unless it were such, it was forbidden to consecrate it with holy chrism. "Altaria nisi lapidea chrismatis unguine non consecrentur." But these words show that wooden or metal altars at that period were still occasionally used. The altar was called in Anglo-Saxon *weofod*, in old English *weuede* or *weved*. "Godes table is the woyeued," says Dan Michel in the "Ayenbite of Inwyt." The altar is also sometimes called God's board. The substructure of the altar was plain, not carved or decorated, and it was covered with a frontal. Hence, when stripped on Good Friday, it did not by its splendour contrast with the mournful appearance of the church, but well symbolised our Lord's body as it hung naked on the cross. As the frontals could be changed, the altar was capable of great adornment on the festivals; and not only rich stuffs, but also embossed plates of gold and silver, were hung around it. According to St. Theodore there were no steps before the altar. This pro-

hibition was derived from the Old Testament, and, as it had in reality no reference to the circumstances of the Christian sacrifice, was in course of time disregarded. There were often many altars in a church. A poem, written about the year 725, mentions fourteen, and another of the same century by Alcuin tells us there were thirty in the cathedral church of York—

Quæ triginta tenet variis ornatibus aras.

Beneath the present church of Ripon are still to be seen chambers and passages which once formed part of the crypt of St. Wilfrid's abbey church, and which illustrate what is said by an old writer in describing the ancient cathedral of Hexham, that many priests and separate groups of worshippers could offer and assist at mass without being visible to each other. "Besides the undercroft, the triforium or gallery running all around the church over the aisles or 'porticus' had many small chapels with an altar in each of them, built in the upper part of the church." There was, however, always one principal or high altar standing towards the east end of the church, and this was distinguished not only by size, position, and splendour, but also by two other peculiarities. It stood in a part of the church reserved for the clergy and separated from the body of the building by a low rail, called cancelli; and it was surmounted by a ciborium, or dome resting on pillars. It appears that in the early Saxon monastery of Abingdon the monks, twelve in number, had each his own chapel, and only on Sundays and festivals was the mass celebrated at the high altar.

James Wyatt, R.A.

J. ELMES.

James Wyatt received and educated many pupils, some of whom obtained eminence, and not a few are enrolled in the list of gold and silver medallists, emblazoned originally by that elegant penman, Tomkins, that hangs framed and glazed among the records of the Royal Academy. The portrait of this eminent penman, who surpassed all his predecessors in this line of art, and has been equalled by none since, was the last that Reynolds ever painted. Mr. Wyatt was never knighted, whether it was ever offered is unknown; but it may have been declined on account of his being a widower. He was elected a Fellow of the Royal Society, much to the annoyance of Sir Joseph Banks, its then president, who preferred twaddlers and titled nonentities to men of genius, whom he feared would discover his shallow pretensions to fill the chair, so gloriously occupied in bygone days by Brouncker, Wren, and Newton. Wyatt was one year, during a misunderstanding among the Royal Academicians, as to which of their important selves should supersede Benjamin West, who was then growing aged, in the presidential chair, elected president without his knowledge. It was upon this or a similar occasion that Fuseli, who wanted a younger and more effective president than the aged painter of the death of Wolfe, wrote in his balloting paper the name of Mary Lloyd. One of West's supporters, asking the sarcastic Swiss why he voted for an old woman, he replied, "Why should I not vote for one old woman as well as anoder?" Wyatt proved a perfect King Log during his reign, for he never troubled either himself or them, and on the few nights that he ever took the chair at a lecture, he fell asleep during its delivery, to the great amusement of the students, who laughed at every oscillation of the presidential cocked hat from shoulder to shoulder. This propensity to doze after dinner was unconquerable in poor Wyatt, who indulged it even at Beckford's table, the most entertaining man of his day, when Nelson was present, interesting the whole party by the recital of his hair-breadth 'scapes and gallant deeds performed by himself and his valiant brothers in arms in the then recently-fought battle of the Nile. "Honor est á Nilo;" not so thought the lethargic architect, for he dozed, and dozed, and dozed again. This eminent man was unfortunately overthrown in his carriage, on a return from Windsor, from the effects of which he never recovered. The office of Surveyor-general of the Board of Works, as held under the crown from Inigo Jones and other eminent architects to his death, has never since been filled up, some of its duties having devolved upon the office of Woods and Forests, and others being filled up by special appointment of the crown, or Acts of Parliament, as in the cases of Sir Jeffery Wyatville and Messrs. Nash, Blore, and Barry.

The Baldachino in English Churches.

G. E. STREET, R.A.

Can a canopy constructed over an altar be designed without damage to the character of a Gothic church? To this I should unhesitatingly say "yes," and I should maintain also that the scale of the church has but little to do with the question. If, however, it is to be regarded from the religious side, I would ask whether the church which can tolerate and admire the rich and gorgeous reredoses now so common, is not straining at a gnat and swallowing a camel if it accepts them and refuses the baldachino, whose sole character is of necessity simple and comparatively unadorned. Loving hands are allowed to decorate our altars in happy antagonism to the old spirit of carelessness which left them dirty, neglected, and repulsive in their appearance; and it is sad that, whilst the carelessness is too often more than tolerated in high places, only too great readiness is shown to thwart its reform when, as in this case, it is possible to make capital out of the use of a word which, to most people, even to those of fair education, is so meaningless as the terrible word "baldachino." Were there less prejudice to contend with I should say that many of our square-ended churches would be more satisfactorily treated if their altars were under canopies than if they were adorned in any other way. I have myself had the satisfaction of restoring to its old use, with the Bishop's consent, an altar under a wooden tester under an arch on the north side of the nave of Burford Church, Oxfordshire. This is really a baldachino supported on oak posts, almost every part of it being old. And every one who has looked closely into the question knows that in very many square-ended chancels or choirs in England the altar was never intended to be put against the east wall. Carlisle Cathedral is a good example of this, and Ripon was until the recent unfortunately destructive alteration of its choir arrangements. Furness Abbey, Arundel Church, Stone Church, Kent, and Warfield Church, Berks, are other examples, and in all of them the buildings are square-ended, without chapels, to the east of the choir, and in my judgment it would not unfrequently cause less interference with old work behind the altar to erect such a canopy as I proposed for St. Barnabas, than it would be to erect the usual reredos. It is self-contained, does not necessarily touch or interfere with the wall, and consequently never need conceal any old feature, aumbry, arcade, or whatever it may be. As to the comparative innocence, in the eyes of a suspicious or extreme Protestant, of a baldachino founded on any old model, and a reredos such as has been erected in churches and cathedrals without end, with full legal and episcopal consent, I cannot conceive of any question being raised. The one is of necessity confined in the scope it affords for decoration, is pure and simple in its form, and has little if any space for colour or sculpture. The latter may be, and often is, gorgeous in colour, covered with sculpture which to some eyes is more or less objectionable, and altogether much more demonstrative. A man may object to the latter because he may think it is attended with some risk of image worship; but I conceive if he objects to the former he may as well object to the canopy over the font, the canopy over the bishop or over the preacher, and finally to the dome at St. Paul's itself, which (as has been well pointed out) is in itself the supreme example of a baldachino.

Rich and Poor Limes.

D. ARAGO.

Lime, whether in a state of purity or (as is more usual) mixed with other substances, is the material used from the remotest times to bind together stones and all the constituent parts of buildings. If lime be not found in any part of the globe pure, the rocks from which it may be extracted—the calcareous rocks—exist almost everywhere. No mineral is so widely distributed by nature. It is rare that calcareous stones are entirely pure, or exclusively composed of lime and carbonic acid. Their substance is usually made up of silex, aluminum, magnesia, oxide of iron, manganese, &c. Thence the terms adopted by mineralogists of argillaceous, magnesian, ferruginous, or manganesian limestones. These limestones furnish by roasting very different limes. Builders distinguish many kinds of them—rich lime, poor lime, hydraulic lime. Rich lime increases greatly in bulk when slaked; its weight is then more than doubled. This property would be very valuable in respect of economy did not rich limes remain a long time without hardening, especially in the centre of masonry, and particularly where they are kept from the action of the air. Rich limes, moreover, are dissolved to their last particles in water frequently renewed. This solubility of the lime in time converts masonry into mere heaps of stones—quay walls, for instance, which have been supposed to have been built of strong masonry and with the greatest solidity. Is it necessary to site examples to show that the rich limes will not harden without the action of the air? We may point to the fact that M. Treussart, having had to reconstruct in 1822, at Strasburg, the foundations of a bastion built in 1666, found there the mortar as fresh as if the masons had laid it some few hours before. A similar circumstance was observed at Berlin by the architects who took down one of the pillars of the tower of St. Peter, built about eighty years ago. Are we required to show that the constant action of water dissolves rich limes in masonry? We choose among a thousand examples the demolition of the remains of the ancient sluices of the Vilaine. During this operation it was found that, by the dissolving of the rich lime, there remained behind the revêtement walls nothing but masses without cohesion—simple heaps of loose stones. Poor or thin lime has all the defects of rich lime, and moreover, as its name indicates, but slightly increases in bulk. The use of it is, therefore, as much as possible avoided.

NOTES AND COMMENTS.

The foreign policy of Russia and its inevitable embroilments in the future do not monopolise the attention of the Russian Government. Like the steam hammer which can crush steel into dust and crack a nutshell, the Imperial power is occupied with the establishment of an academy of art in Rome as well as with the fortifying of Batoum. For some time past young painters, sculptors, and architects have been sent from the North to study in Rome at the expense of the Treasury, but there is no official residence for them resembling the Villa Medicis, which is open to the French students. The Russian artists are allowed a choice in selecting their lodgings. Some check is exercised over them by the superintendence of the Ambassador, and it is expected that every year examples of their work will be sent to St. Petersburg. A few years ago an offer was made for the Barberini Palace, but the purchase money demanded by the owners was so high that the Government recoiled. It is now understood that the negotiations for the Villa Patrizi have been more successful, and that the building will be transformed into an academy and placed in charge of M. Bogolubof. Whether it is wise to keep students for three or more years in Rome is a question about which there is less unanimity now than formerly. The French students are of late allowed a good deal of latitude, and part of their time can be spent in one of the other cities of Italy.

The Lords of the Committee of Council on Education have appointed a committee consisting of Sir F. Leighton (chairman), Mr. Poynter, Mr. Alma-Tadema; Mr. Carl Haag and Mr. Henry Wallis, named by the Royal Society of Painters in Water-Colours; Sir J. D. Linton and Mr. F. Dillon, by the Royal Institute of Painters in Water-Colours; together with Mr. Sidney Colvin, of the British Museum, and Mr. Armstrong, of the Science and Art Department, to consider the question of the action of light on paintings in water-colours. Captain Abney and Dr. Russell, who have for some time past been making a scientific investigation of the action of light on the various pigments used in painting, will inform the Committee of Artists of the method and nature of their inquiry. With this information before them the committee will be in a position to judge whether there are any further points which they would desire to suggest to Captain Abney and Dr. Russell for investigation, or whether there is any inquiry which they would themselves wish to carry on.

The report of the Association for the Promotion of Fine Arts in Scotland states that during the past year a sum of 3,424*l.* 1*s.* has been subscribed. Twenty-five oil paintings and ten water-colour drawings were purchased from exhibitions in Edinburgh, at a cost of 741*l.* 15*s.* In addition, Mr. George Reid, R.S.A., was paid 262*l.* 10*s.* for a series of water-colours illustrative of the Clyde. It is proposed to present to the subscribers a photogravure measuring 32 inches by 22 inches, after Sir Noel Paton's picture, *The Quarrel of Oberon and Titania*, in the Scottish National Gallery. The plate will be produced by Mr. Annan and Mr. Appleton. Since its formation the Association has obtained upwards of 240,000*l.* In the balloting for pictures which took place after the annual meeting, a great many subscribers living at a distance were successful. Pictures will find their way to Brisbane, Sydney, Adelaide, Toronto, Bombay, Calcutta, Demerara, Coromandel, Sumatra, Valparaiso, &c.

The forgeries of Bank of England notes, which are circulated abroad as well as in England, have become a serious grievance. The advertisement from Scotland Yard, which appeared on Monday, reveals that London is not exempt from them. Hitherto the authorities in Threadneedle Street supposed that protection was insured by the paper, water-mark, and style of printing. It is now found that all three can be imitated. The question should be asked whether much could not be done by introducing more art in the notes? The figure which Maclise designed, and that is engraved, is on too small a scale to be inimitable. The late Paul Baudry was commissioned by the Bank of France, and the allegorical figures which now appear on the back and front of the notes are in so good a style as to be beyond the power of ordinary engravers. Supposing the Directors of the Bank of England employed the President of the Royal Academy and the best line engraver in the preparation of a new design, would not more security follow? Beautiful contours being difficult to copy are certainly worth the attention of bank directors. At present the English notes cannot compare in beauty with foreign notes.

Some months ago the collection of Japanese enamels belonging to Mr. W. J. Muckley, the flower painter, and formerly head-master of the Manchester School of Art, was purchased by Mrs. Abel Heywood. That lady has now presented it to the Corporation of the city, for the benefit of the citizens of Manchester.

The sum of 10,000*l.* is about to be expended by the Congress of the United States upon a statue or group which will be commemorative of the services rendered to the United States by Lafayette and his companions during the War of Independence. The French sculptors, MM. Bartholdi and Falguière, have already sent in models. Apparently they have not been considered entirely satisfactory, since M. Mercié is now preparing a model by request.

An Institution of Permanent Way Inspectors has been formed, and the first general meeting was held in Birmingham on Saturday, under the presidency of Mr. G. W. Keeling, C.E. It was suggested that, when formally established, the new society should be recognised by the Institution of Civil Engineers. The railways in Great Britain, according to the President, are now nearly 19,000 miles in length, and the rails, which originally weighed 40 lbs. per yard, now weigh 90 lbs. Among the subjects recommended for investigation was the "creeping" of steel rails on single lines. The right-hand rails creep in a contrary direction to the left-hand, although the one rail has frequently to creep uphill. The cause of this has never yet been satisfactorily explained. In Germany to check the "creep" angle fish-plates are sometimes used, the projecting flanges at their base abutting against spikes on the sleepers.

The parish church of Hythe is now being restored under the direction of Mr. Pearson, R.A. A shaft having been sunk in the churchyard, the crown of an arch was revealed, and at a depth of 14 feet below the surface the footings were found of a very fine Early English doorway communicating with the crypt. The marble column on the left-hand side was in its place, and the stonework in an excellent state of preservation. The mouldings are of the same character as those of the main entrance to the crypt, though not so rich, and the capital and shaft, which have been already unearthed, are almost identical with those of the existing doorway. If, as is conjectured, the adjoining garden is the site of the old monastery, it is probable that on high festivals the monks marched in procession through the crypt, passed out through the newly-discovered doorway, and re-entered the church by a door on the east wall of the north transept, the jambs of which may still be seen. Soon after the suppression of monasteries in the time of Henry VIII. this entrance was probably disused and the soil allowed to accrete until in time it became completely covered up.

The Isle of Man is not a region in which there is much building, and the laying of the foundation-stone of a new hospital and dispensary, on Monday, was an event of some importance. The site and 5,000*l.* have been given by Mr. and Mrs. Noble. The building will be called "Noble's Isle of Man Hospital." Accommodation will be provided for fourteen male and fourteen female patients in the general wards, and for four patients in smaller wards. Private wards will be likewise provided. The building will be faced with red pressed bricks and terra-cotta dressings. The contract is being carried out by the executors of the late William Gradwell, of Barrow-in-Furness, for the sum of 4,038*l.*, from plans by Messrs. Bleakley & Cubbon, architects, Birkenhead.

THE WEDDING GIFTS.

THIS etching, which is taken from *L'Art*, shows the influence of FORTUNY upon his countrymen. It will be remembered that in his works the backgrounds are utilised to an almost unprecedented extent, and however fantastic the ornament may be, it does not seem out of place. M. GONZALES has taken great care in painting the room, but if a plainer background were substituted the composition must suffer. The etching is by one of the celebrities in the art.

THE BRITISH ARCHÆOLOGICAL ASSOCIATION.

ON Monday last the forty-third Congress of the British Archæological Association was opened in Darlington under the presidency of the Bishop of Durham.

The President, in his opening address, said that archæology was every day assuming a more scientific attitude. He knew no part of the country where there were more objects of interest for the archæologist than the county of Durham and its immediate neighbourhood—the area which they had undertaken to explore this year. Moreover, it had a special attraction for the antiquarian in the fact that the earliest ages yielded the richest harvest. These northern counties had no small hand in the making of England. The ancient kingdom of Northumbria was for some generations the focus of light and learning; the centre of civilisation and of order in this island. The present county and diocese of Durham is the nucleus of the old Northumbrian kingdom. Following the practice of several of his predecessors, he should adopt a rough chronological order in the few remarks which he had to make. It was a recognised maxim in political economy that the most valuable legends of economic science were to be learnt on the frontier of cultivation. The corresponding rule seemed to hold good with the history of races and empires. If they would appreciate the true greatness of England, and of the English race, they should go not to Manchester, or Liverpool, or Glasgow, not even the great metropolis itself, but to India, Australia, and America for its most striking manifestations. In like manner Roman greatness was best measured and appreciated on the Roman frontier. When they considered what recent scientific discovery and invention had done for themselves, how largely they were indebted to steam and electricity, and how crippled they would feel themselves if they were restricted once more to the means of travel and communication which satisfied their great grandfathers—they would be filled with admiration at the achievements of the Romans seventeen centuries earlier in the remote provinces of the empire, distant hundreds and even thousands of miles from the centre of government. Hadrian's Wall, through great tracts, traversed very sparsely inhabited country districts with only here and there a homestead at wide intervals. But the remains showed that in the time of the Roman occupation it must have gathered about it, throughout its whole length, a large and varied population, very much larger than had inhabited the district at any time since, and that this population was furnished with all the chief appliances of Roman civilisation. Again, how suggestive was the inscription found but a few years ago at South Shields! The husband, a Syrian from the far East—perhaps a legionary, perhaps a merchant—inscribed a memorial stone, partly in the acquired official language of Rome, partly in his native Palmyrene tongue and character, to his lost wife, a woman of British birth. The extreme north-west and the extreme south-east of this vast empire were thus linked together by the binding power of the Roman ascendency. A great ideal led to great results. Her most famous poet fixed the ideal for Rome in the charge "Tu regere imperio populos, Romane, memento," and splendid achievements followed on the recognition of this mission. They claimed it not the least merit of archæology that it counterbalanced the vagaries and redressed the injustices of literature. Probably there were no two sovereigns to whom Rome owed so great obligations, none who did so much to preserve her from early decay, as Hadrian and Antoninus Pius. To both those great emperors literature had been cruelly unjust. The historical record of these two long and illustrious reigns—of the former more especially—was miserably scanty. Yet their fame was written across this island from sea to sea in imperishable characters of stone; and elsewhere likewise the monuments relating to this period were eloquent, where the voice of history had been gagged. The Roman Wall is a speaking monument to the policy of Hadrian. The proximity of the Roman wall had scored Durham with roads and dotted it with stations. Thus, Watling Street—our Watling Street—entered Durham at Pierce Bridge, where it was traceable in the modern road for miles straight as an arrow, and traversed the whole county from south to north in three giant strides, each footprint being marked by a Roman camp—Binchester, Lanchester, Ebchester. Another great road, beginning at St. David's and passing through Birmingham and York, entered the county of Durham (probably at Pounteys Bridge), and, crossing the Wear, terminated in the north at the Tyne. But these two main arteries by no means exhausted the road system of the Romans in this county. Local names in abundance testified to this fact. Chester-le-Street, Stainton, Leamside, might serve as examples of many such names which indicated the Roman occupation. The Roman occupation ceased early in the fifth century. The native British were not permitted to build unmolested on the foundations of Roman civilisation. A whirlwind and a deluge of foreign invasion swept over the land, carrying everything before it. Hence there was an absolute discontinuity between the Roman and the Saxon era. It was in this second—the Saxon—epoch they boasted their possession of antiquarian treasures such as no other county in England could show. The light which afterwards spread over Europe through Alcuin, and ushered in the dawn of a new civilisation, was kindled in Northumbria by Hilda and Benedict Biscop and Bede from the spark transmitted from Iona. The remains of the twin monasteries of Benedict Biscop, St. Peter, Monkwearmouth, and St. Paul's, Jarrow, still existed "plain for all folk to see." The scepticism as to any genuine remains of Saxon architecture, by which former generations of archæologists sought to compensate for hasty and over-sanguine theories in other directions had passed away. Few, if any, would doubt that we now had at both these places remains of the original structures, and, happily, these were dated edifices. The actual dedication-stone of Jarrow, the younger of the two by about ten years, was extant. It declared that this was the church of St. Paul, on 9th of the Calends of May (April 24), in the fifteenth year of Eefrid the King, and in the fourth of Ceolfrid the Abbot, and under God's guidance, the founder of the said church, *i.e.*, in the year A.D. 684. The remarkable fact was that, though the Romans were such eminent builders, they left no disciples behind them in these parts. The twin churches of St. Peter and St. Paul were modest and humble structures indeed compared with the mighty piles reared for civil and military purposes by the Romans. Yet Benedict Biscop was obliged to import masons from the Continent to erect them, as he afterwards imported glaziers to fill the windows. The churches hitherto built in these parts were wooden structures, as was the case with the earliest Lindisfarne Church, built by St. Finan about twenty years earlier. These were the words of Bede—"entirely of hewn oak, and thatched with reeds." This earlier style Bede called the Scottish—*i.e.*, the Irish, which was thus distinguished from the Roman. The twin monasteries of St. Peter and St. Paul were named after the two great Basilicas of the city of Rome. Benedict Biscop paid several visits to Rome in connection with their building. He summoned an instructor in chanting from Rome. The style of architecture was Roman. This was the first intermingling—momentous in its consequences—of two separate streams of Christian teaching and influence in the Northumbrian Church. Hitherto the Northumbrian Church had derived everything from the Irish Christianity of Iona. From this time forward the power of Roman Christendom made itself felt with ever-increasing force. He had now arrived at the Norman period, and how could he do otherwise than take them at once to Durham? If Monkwearmouth and Jarrow and Escomb had shown the beginnings of English Romanesque, here, at a distance of a few miles, they had its climax and its latest efforts. Durham exhibited a complete series of Norman work in its most typical and splendid forms. The series commenced with the chapel in the castle, and it ended with the Galilee of Pudsey. The first reminded them in its rude sculptures of Saxon work; the last was already on the very verge of Early Pointed. Of Durham Cathedral he ventured to think that it had no rival at home or abroad—a splendid architectural jewel in a perfect natural setting. Before leaving Durham he might call attention to three broad facts which stood out in the inspection of the buildings—the cathedral, monastery, and castle. In the first place, they were brought face to face with the *cultus* of St. Cuthbert—a phenomenon unique, at least, in England, in its strange character and in its far-reaching issues, for the case of St. Thomas at Canterbury was hardly a parallel. The Danes proved the greatest benefactors to the Northumbrian monks when they expelled them from Lindisfarne. To these wanderings St. Cuthbert owed his exceptional fame; and out of this fame sprung the "patrimony of St. Cuthbert," with all its ulterior consequences. In the next place, they found themselves confronted with another great and far-reaching fact, intimately connected with and flowing out of the "patrimony of St. Cuthbert." This was the Palatine jurisdiction of the Bishops

of Durham. The princely coronet by right encircled the mitre of the Bishop of Durham alone among English prelates. The sword was the accompaniment of the pastoral staff in the arms of the Bishop of Durham. He was glad to see that this Palatine power—this *imperium in imperio*—which grew up gradually and mysteriously in the early centuries of the Northumbrian episcopate and was swept away by one stroke exactly fifty years ago, would be the subject of a special paper at this congress. There was a third and last point to which he desired to direct attention. The cathedrals of the old foundation were the homes of corporations of secular priests. The cathedrals of the new or Henry VIII.'s foundation were monastic institutions, the homes of regular clergy. It seemed to him that the most perfect type of the former for the study of the archæologist was Wells, where the ancient buildings were so largely preserved; while the most perfect type of the latter was Durham. No old monastic buildings in England, so far as he was aware, were so complete. Almost all the principal elements of the monastery remained substantially as they were of old. The ancient churches in the rural districts of Durham were not thickly scattered over the ground, as they were, for instance, in the eastern counties. The population in ancient times must have been sparse, and the parishes were consequently very extensive. Six or seven parishes would have spanned the whole county from north to south or from east to west. There were now some 240 parishes in Durham. Of these, about two-thirds had been constituted during the present century, and (with few exceptions) during the last forty years. But while the old churches were comparatively few, it was quite the exception to find one which had not features of real interest for the antiquarian. Time would fail him to trace the development of Pointed architecture as exemplified in the churches of this county. He would only say generally that they had a much richer series of examples in the earlier stages than in the later, and that the decline was gradual as time advanced. Their finest examples belonged to the Early English or first Pointed; while the Perpendicular was the worst represented of all. They had not, so far as he remembered, a single purely Perpendicular church of any considerable pretensions. The great outburst of Perpendicular architecture, which had so lavishly studded many southern parts of England with large and imposing structures, made only a feeble impression upon Durham. Of castles, they could boast several striking examples—Raby and Brancepeth, Lumley and Hylton, and Barnards, not to mention Durham. He had been obliged to confine himself to the county of Durham, and even within this limit he was painfully sensible how very slight and inadequate his sketch has been, but he threw himself confidently on their good nature and indulgence.

During the day the churches of Aycliffe and Haughton-le-Skerne and St. Cuthbert's, Darlington, were visited.

At the annual dinner held at the Trevelyan Hotel, the Bishop of Durham presided, supported by the Mayor of Darlington. After the usual loyal toasts, Mr. Wright proposed the toast of "The President of the British Archæological Society," associating the toast with the president, the Bishop of Durham, whom he congratulated on his learned and excellent address that afternoon. The Bishop replied, and remarked upon the privilege and the honour he felt in occupying that position. He alluded to the richness of the archæological remains of Durham, and cordially welcomed the members of that association. The Bishop having to leave, Sir James Picton took the chair.

ARCHÆOLOGY IN ITALY.

THE splendid revival of archæological research in Italy which has been among the consequences of the removal of the capital to Rome has been during the past year, says a correspondent of the *Times*, fruitful in discovery, and promises an advance in archæological science such as has not been known since the Renaissance. There are circumstances connected with some of them whose interest is rather romantic than critical, of which the chief are the discovery of a Mithraic shrine and apparent place of meeting of a mystic association at Ostia, with curious indications of a kind of classical Freemasonry, fecund source of speculation to come; the great tomb out of the Porta Salaria, discovered many months ago, but of which the central chamber has only lately been found; the uncovering of a Pelasgic wall at Tusculum, the first evidence of Pelasgic occupation of the Alban range; the discovery of the site of Vetulonia, with most interesting historical (or rather prehistorical) indications; and the recent finding of a statue of Antinous in the excavations for the National Bank. This last, I learn from Professor Lanciani, was found under circumstances which induce him to sum up a romantic history for it, as read in the circumstantial evidence disclosed by it and its state. It would appear that it had been, at a distant epoch, thrown into a stream highly charged with carbonate of lime—probably the Aniene—and that in the Middle Ages it had been discovered and rescued, and after attempts to remove the deposit of carbonate of lime it had been hidden in a small chamber of some structure which was buried in the destruction of that part of the city. The statue is of Greek marble, and was evidently treasured, though slightly mutilated, previous to concealment, so that the Mediæval amateur who hid it was clearly one who appreciated the antique. This is not the first case of antique statues carefully concealed and brought to light in modern times, as all students of archæology will recall the *Venus of Melos* and the colossal *Hercules* now in the Vatican, which twenty-five years ago I had the pleasure of seeing raised from its grave in a drain, where it had been carefully arched over; but both these were probably pagan concealments due to reverence; that of the Antinous is as clearly due to æsthetic as the others to religious respect. The great tomb of the Via Salaria has a still more remarkable history—always following Lanciani's reading, and one could hardly have a safer—for it had evidently in early times been levelled as to its upper portion and buried in accumulation of *débris* and soil; then, or possibly before, used as quarry, so that only the side carrying the inscription remains entire to the cornice; then burrowed into as a Christian burial-place, the passage to the great chamber being dug into on both sides by *loculi*, and these again opened within the past two or three centuries, and then completely tunnelled under by a catacomb which traverses the entire foundation. This latter is not yet altogether cleared out, and a portion of the circle of the tomb is not yet disengaged from the surrounding tombs and columbarian-like structure which were built against or around it. The work on it is now suspended, I presume until next winter. The discovery of Pelasgic walls on the Alban formation of hills is interesting, as, while abundant on the Sabine and Volscian hills in sight of Rome, the fact of nothing attributable to that epoch of civilisation being found on this group of hills was the basis of a theory, taken in conjunction with the primitive cemetery on Monte Albano under volcanic deposits, that this range, with the whole tufa formation of the Agro Romano, was possibly thrown up since the period of Pelasgic civilisation commenced. If this newly-found wall shall be decided to be genuine and not archaistic, it of course throws discredit on this theory, always a hazardous one, but not absolutely incredible.

Our ambassador, Sir J. Savile Lumley, has also added one to the list of remarkable discoveries, that of the site and ruins of the almost mythical temple of Diana at Nemi, made familiar of late by Renan's use of it as a parable on French history, and the priest of which was always obliged to be on his defence against any aspirant to his succession, every new-come priest being obliged to create the vacancy he desired to fill. The find in these excavations has been most bountiful, including one of the most remarkable and perfectly preserved Roman female portrait figures I have ever seen, though the body is represented by a draped herma to which arms, now lost, appear to have been fastened by iron bolts. Sir John's excavations in this most interesting site were cut short by the most absurdly exaggerated pretensions on the part of the proprietor, Prince Orsini, who insisted that Sir John should engage to clear the entire site, above a quarter of a mile square, carry all the *débris* to fill up a marsh on the shore of the lake, involving an expense of above 7,000*l.*, besides permitting Orsini to select from the find whatever pleased him without restriction, failing acceptance of which Sir John was compelled to fill up whatever had been excavated—so that now the locality is restored to the *status quo.* Orsini indeed!

Similar abuses of proprietary rights over sites of historical interest and the want of a common law for the regulation of excavations throughout the kingdom have induced Senator Fiorelli, the head of the Archæological Department, to address to the Minister of Public Instruction a relation on the laws concerning the excavation and possession of objects of archæological value or artistic interest. This relation reviews all the laws now in vigour or promulgated by defunct Governments in Italy, beginning with the States of the Church in 1244, when Innocent IV. revoked the cession of half the Flavian amphitheatre to the Emperor Frederick II., and covering the subsequent history of every province in Italy, where laws on the subject have been enacted. Deducing from these the inherited right to control the possession of antiquities, the relator lays down a complete system of prevision, uniform for the entire kingdom, for the regulations of excavations under State supervision and by official permission only.

The importance of this legislation is shown by the instances of valuable historical indications discovered by intelligent record of the circumstances attending finds, as well as by cases of what might have been such, becoming worthless from concealment or ignorance of the *provenance*; and in another way by the mass of counterfeits of all kinds of antique objects which flood the market, purporting to come from Greece, from Asia Minor, &c., when a well-regulated system of supervision and registration or stamping officially would have thrown them at

once in the category of detected frauds. Fiorelli says on this subject:—"It is this want of localisation which most harms research, since false indications contaminate permanently the sacred patrimony of science, and investigation is turned from the most sure and profitable paths. We have lately seen objects attributed to Lucania which came from Latium; to Campania, others from Etruria; and to Attica things found in Tarentum." It is in the interest of science that this enormous trade in falsely attributed objects should be stopped; but still more, both in that of science and honest collectors, that the greater commerce in absolute forgeries should be suppressed by regulation of research. The number of forged terra-cotta figurines sold every year purporting to come from Tangara, Corinth, Attica, Megara, Myrina, Kyme, &c., is incredible, and probably three times as great as that of the total number found. They are mostly made in Smyrna or, haply, by Italian artists, and so perfect are the imitations, even to breaking a statuette into twenty pieces to add plausibility to it, that there are said to be only three people in Athens who are competent to determine their genuineness. All the recently-found large groups from Asia Minor are denounced by Reinach as forgeries, and there are few judges so competent as he, being an experienced excavator and archæologist of the widest education. Then, a new trade is springing up in bronze mirrors. One was offered me the other day which was evidently antique, but the engraving on which was of the subject of David and Goliath. The artist knew more of Bible history than of mythology. A long chapter might be written on the ingenious forgeries I have seen and known the history of—they would include objects ranging from portraits by Rembrandt to archaic Etruscan gems, and all of which have deceived recognised experts.

It is to be hoped that Fiorelli's proposed law will obtain not only in Italy, but in Greece, and, if it were possible to enforce law, in Asia Minor; for, if not, the multitude of forged *objets de Musée* will soon confound all archæological science. All these are made possible by the necessity of keeping excavation secret or of not supervising it efficiently. If Greece and Turkey will adopt Fiorelli's law they can, within certain limits, stop clandestine commerce by leaving no inducement for it, and nobody will be the worse for it except the counterfeiters. The project of the Department of Antiquities will offer especial facilities for excavations and acquisitions to foreign societies and museums, while guarding strictly the interests of science.

THE BIRMINGHAM ASSIZE COURTS.

THE General Purposes Committee of the Birmingham Town Council in their report state that, in accordance with instructions given to them by the Council, they invited architects to send in designs for the proposed new Law Courts. The committee were enabled to make arrangements with Mr. Waterhouse, R.A., for the purchase of his sketch plans, which were subsequently lithographed and sent to each competitor, on payment of a charge of one guinea. Full instructions were prepared by the town clerk, in conference with Mr. Waterhouse, and sent to the competing architects. No less than 571 applications were received for copies of the instructions, and 144 firms or individuals also applied for the sketch plans. On February 1, 126 separate sets of designs were received, and the committee were engaged for several days afterwards, in conference with Mr. Waterhouse, in selecting from this number five designs which appeared to them best worthy to compete in the final competition. Mr. Waterhouse in his report said:—"I have carefully examined the designs sent in in the first competition, under 126 separate mottoes. Many of these are of unusual excellence, and it has been a work of impossibility to select from among them five for the final competition without excluding some which appear to me in every way worthy of such distinction. In this difficulty I have been aided by the opinion of the sub-committee, who have discussed with me the merits of the designs from a practical point of view, and especially of those from among which, in my opinion, the first five ought to be selected. The result of this conference is that, out of the seven designs from which I concluded the final selection would have to be made, the following are chosen:—(14) 'Two Judges of Assize,' (86) 'Law and Order' (design A), (88) 'Via Una,' (103) 'Terra-cotta,' (121) 'Sincerity' (elevation No. 2)." Mr. Waterhouse made several suggestions with reference to the preparation of further detail drawings for the final competition, one of the principal ones being that the attention of competitors be called to the importance of abundant light everywhere, not only in the several courts and offices, but in the corridors also. The sketch plans were defective in this particular in one or two points, and it was essential that in the finished designs such defects should be remedied. A further point to which attention was directed was the requirement that the elevations towards the passage and Steelhouse Lane should be of an inexpensive character, as the condition limiting the outlay to 78,000*l.* would be rigidly enforced, involving the rejection of any design, whatever its other merits, which in the opinion of the assessor was likely to transgress this limit. In returning the selected designs to their respective authors for the preparation of further enlarged and detail drawings for the final competition, further instructions were prepared by the town clerk, in accordance with Mr. Waterhouse's suggestions, and sent to the successful competitors on March 11 last. On June 2 the five sets of further plans were duly received from the selected competitors, and were inspected by the committee and the consulting architect. On June 19 the committee received the following report from Mr. Waterhouse:—

"20 New Cavendish Street, Portland Place, W., June 18, 1886.—I have carefully examined the five designs sent in for the final and limited competition, namely (1), 'Law and Order'; (2), 'Terra-cotta'; (3), 'Sincerity'; (4), 'Via Una'; (5), 'Two Judges of Assize.' I find that, while the authors of these designs have all adhered to their original conceptions, some of them have introduced minor changes into their plans, such as giving better light to corridors and greater convenience of arrangement. All have supplied the extra drawings asked for, and have prepared them in compliance with the requirements of your second instructions. I may observe that in 'Law and Order' your assessor's plan is rigidly adhered to; and in 'Sincerity,' 'Via Una,' and 'Two Judges of Assize' its general features are retained, whilst changes have been made in some of the details which, without doubt, are for the most part improvements. 'Terra-cotta,' on the other hand, makes great changes, principally in that portion of the building facing Corporation Street. This departure from the sketch-plans has not been done recklessly, but is the result of a bold and original treatment of the question. After very anxious consideration I have come to the conclusion that, notwithstanding the obvious merits of some of the other designs, 'Terra-cotta' is the one which I ought to recommend for your adoption. The charms of this design are in its thorough mastery of details, their delicacy, and in its general picturesqueness. This picturesqueness is secured in great measure by the plan being kept rectangular with itself throughout, and so not conforming with the line of Corporation Street. It is the work of a master in his art, and the general arrangements seem to me to be without defect, unless it be considered that the public hall is placed too near the entrance; an inconvenience which the author has met by a wide witnesses' corridor running transversely across the building. This design is described as being faced throughout of terra-cotta and brick, undoubtedly in my opinion the best materials for Birmingham, and obviously more satisfactory than a treatment which would give a stone front to Corporation Street, and use an inferior material towards the passage and Steelhouse Lane. I have no doubt that this design can be erected for the 78,000*l.*, the limit of your expenditure."

Before finally arriving at their decision the committee invited the members of the Council, the magistrates and their clerks, the coroner for the borough, the members of the local bar, and the Committee of the Birmingham Law Society to inspect the five selected sets of designs, and the committee have further had the advantage of meeting a deputation appointed by the magistrates, and receiving certain suggestions from them which appear to the committee well worthy of consideration. Ultimately, and after further consultation with Mr. Waterhouse, the committee have resolved, "That this committee, agreeing with Mr. Waterhouse as to the general merits of the design marked 'Terra-cotta,' recommend the Council to select the author of that design as the architect of the new Law Courts; and they further recommend that the architect be instructed in conference with the committee to make such modifications in the plans of the building as in their opinion may seem desirable."

The *Birmingham Post*, in describing the design marked "Terra-cotta," says:—The Corporation Street frontage will be strikingly bold and picturesque, and will yet be worked out with all the delicacy and richness of ornament to which a red brick and terra-cotta structure lends itself. Of the three portions into which it is divided, the central one is 80 feet in length, and is flanked by two turrets, rising each to a height of 105 feet, and setting off, as one looks up from the street, the crested ridge of the public hall, 75 feet in height. The upper portion of this central piece of frontage is set back some 12 feet from the lower, and the design is further broken by buttresses, which are carried up 50 feet high to the leads, and have terra-cotta terminals. Between the buttresses are five broad three-light mullioned windows, which on the ground floor have square heads, and on the first floor elliptical. They will be filled in with tinted glass. A fine central entrance stands out from the façade, is furnished with an iron gate of a richly-embellished character, and has a turreted gable surmounted by an ornate clock tower and an open belfry, which are crowned with a sculptured figure of Justice. The left wing of the façade projects about 30 feet beyond the central portion of it, and the right wing falls back a shorter distance. In each the mullioned windows are continued, and each has a handsome gable with a

flèche. Behind the public hall and the wings, the building is a clear storey lower till the Steelhouse Lane frontage is reached, but this elevation has not been elaborately wrought out like the other. The main entrance to the building is by a wide double flight of stone steps and a vestibule, left and right of which are arranged a post and telegraph office, and a retiring-room for ladies. From the vestibule the public hall is directly entered—a fine apartment, 80 feet long by 40 feet wide, and fully 60 feet in height. The design does not touch the embellishment of this hall, which at first will only be relieved by the coloured rays streaming down from the clerestory windows in the front, and by a small drinking fountain; but it will afford some day, as the architect suggests, an ample field for decorative work in fresco and sculpture. The arrangement of the interior places the magistrates' courts and the inquest rooms, which are most often used, nearest the entrance, and the assize courts in the rear. The former extend across the building, and are four in number—three for the magistrates, measuring 40 feet by 30 feet each, and one for the coroner, measuring 30 feet by 24 feet. Of the three corridors by which they are separated, the central and the widest will be known as the judges' corridor; that on the left is for the use of persons attending the coroner's court, and that on the right for the magistrates, &c. The judges' corridor runs the entire length of the building, and terminates in a hexagonal vestibule, from which the judges' retiring rooms, each 17 feet by 16 feet, are entered on either side. These, with two retiring rooms for the juries, are behind the judges' benches. Each court of assize measures 56 feet by 40 feet. The plan upon which the interiors of the courts are arranged is uniform throughout, and was suggested to the various architects after long consideration. It combines many merits. The bench extends across the court at one end, and the witness-box is just under it on the right hand side of the magistrates' clerk's desk. On the left-hand side are seats for reporters. Rows of seats for solicitors and members of the bar face the bench, and behind them stands the dock, except in the civil court, where it is dispensed with. At the other end of the court there are two rooms for witnesses in waiting, and the floor slopes upwards from the solicitors' seats to a public gallery above these waiting-rooms. Special attention has been given to the desideratum of so arranging the ingress and egress of the general public that it shall not interfere with the business of the courts. Not only, therefore, is there no means whereby the public can invade the courts from their galleries, but people who are not actually concerned in cases under hearing must come into the building by a separate entrance in Newton Street. This leads by a direct staircase to a transverse corridor on the floor above, whence alone the galleries are reached, and from which none but witnesses may descend to the ground floor. It will be understood that in order to cause the galleries to be thus easily and securely approached, the magistrates' and coroner's courts are placed, so to speak, feet to feet; but it is precisely on this point that, as we understand, the General Purposes Committee has been asked to confer with the architect with a view to some modification of the plans.

It is stated that the magistrates would look with great favour upon an arrangement which would admit the public at the opposite end of their three courts. Added to the difficulty of making this change on the plan at present proposed, there is the fact that one of the magistrates' courts is to be used for overflow cases at a busy assize; but no doubt is entertained that if the change commends itself to the architect, his ingenuity will be equal to the task of contriving it. The purpose of the change is to avoid any clashing between the suitors at the assize courts and the witnesses at the magistrates' courts, when judges and justices are sitting at one time.

In connection with the magistrates' courts there is a large suite of accessory rooms. That court which will occasionally be used for assizes has a judge's retiring-room behind the bench, measuring 22 feet by 15 feet. What will be termed the first court has in a similar position a retiring-room for the justices and a room for the summoning officer, while the other magistrates' court has attached to it a much larger retiring-room, the dimensions of which are 34 feet by 21 feet. Near to this room, and looking out into Corporation Street from the right wing of the façade, there are rooms for the magistrates' clerk and his clerks. The coroner's court has also its retiring-room, and its room for witnesses in waiting.

A very fine suite of rooms surrounds the two assize courts. Behind them, lighted and entered from Steelhouse Lane, are the barristers' rooms—a large robing-room in the basement, a reading-room, 60 feet 6 inches by 25 feet, on the ground floor, and numerous consultation-rooms on the ground floor and the first floor. Down the outer side of each court runs a solicitors' corridor, with rooms for defendants' and plaintiffs' witnesses to be heard in the civil court, and for the witnesses of prosecution and defence to be examined in the criminal court. The High Sheriff's room is close by the advocates' entrance—*i.e.*, on the same side as the civil court; the rooms of the Clerk of Indictments and Clerk of the Crown are on the opposite side. There are rooms and lockers for solicitors and a room for solicitors' clerks. The grand jury will be accommodated in a spacious room situated above the largest of the magistrates' retiring-rooms, sufficiently removed from the bustle of the corridor, yet within easy access of the criminal court. Refreshment buffets take up the right wing of the façade, and there is an elaborate provision of lavatories, &c., for all the departments. The basement does not extend over the whole site, but it comprises, nevertheless, large beer and wine cellars, a boiler-house, living rooms for the curator, provision for heating and ventilation, a number of cells for prisoners in waiting, and in connection with them an apartment for the governor of the borough gaol, as well as the barristers' robing-room. It need hardly be said that with uses so varied the basement is not a place over which one may wander from one part to another. It is, in fact, a collection of separate basements, inaccessible for the most part one from the other. There is a second floor in the right and left wings of the façade; the left wing containing kitchen, scullery, larder, &c., and sitting and bedrooms for the restaurant-keeper; the right wing two bedrooms and a living room for servants. A good deal of intelligent attention has been paid to the matters of light and heating. For heating purposes fresh air will be warmed in chambers underneath the courts, and run through a number of coils. Fresh air for ventilation will be drawn down a shaft in one of the towers, screened and "washed" in its passage to the basement, and issued into the courts through a network of air ducts. As it is vitiated by use, it will be withdrawn through extracting flues by means of a steam-driven fan in the basement, and discharged by another upright shaft. With a view to preclude draughts, the entrances to the courts will be furnished with lobbies and double doors. The scheme of lighting seems to be admirable. The three parallel corridors which separate the various courts have glass roofs at the height of the first floor, while the roofs of the courts themselves are carried higher, so that light may be admitted through clerestory windows at the level of the public galleries. A dynamo machine will, moreover, find a bed in the boiler-house, and will generate electricity when it is necessary to provide artificial light.

The police force will have quite as much reason as the public to congratulate themselves on the abandonment of the Moor Street premises, and we are not sure that their jubilation will not be shared by that class of the population which is best acquainted with the old cells. The police-station soon to be quitted was unworthy of the town; of that which is to take its place the town might almost be proud. It will be a building 125 feet long, about 42 feet in mean width, and containing four storeys. Between it and the assize courts will run a new street 20 feet wide, indispensable to these latter for lighting purposes. The new building will have a frontage in Steelhouse Lane, and its interior will be divided into a section for offices and a prison. All who enter it must first pass into a spacious charge-office, measuring 27 feet by 20 feet, on the ground floor. In the basement, beneath this office, there will be a reserve room; in the upper storeys four rooms for the detective police, two of them 27 feet by 20 feet, and the other two 19 feet by 19 feet, together with two consulting-rooms. The cells will be eighty in number. Twenty of them will open on to a gallery on each floor, over the banisters of which one may look into a shaft giving light and ventilation to the whole prison. A circular staircase will connect the various floors, and an underground passage will cross the new street, whereby prisoners may be conveyed to the courts without being taken into the open air.

ARCHÆOLOGY IN LINCOLNSHIRE.

(*Concluded from page* 56.)

Somerton Castle.

IN looking upon the remains of the ancient castle before you three questions will naturally be asked?—1. Who was the builder? This was Anthony Bec, second son of Walter Bec, Baron of Eresby, born about the middle of the thirteenth century, and brother of Thomas Bec, consecrated as Bishop of St. David's, at Lincoln, in the presence of Edward I., his queen, Court, and eight bishops, on the occasion of the translation of St. Hugh's body, October 6, 1280, the whole cost of which ceremonial he defrayed. Three years later Anthony Bec was consecrated Bishop of Durham by his brother of St. David's. He was perhaps the greatest of the old magnificent bishops of Durham, and enjoyed the high-sounding titles of Count or Prince Palatine, Patriarch of Jerusalem, and King of Man. He took a prominent part in the Scotch wars of Edward I., and, at the head of 500 horse and 1,500 foot-soldiers, led the van of the royal army of invasion in person, when he was wounded in the king's service. Yet on three occasions he was severely taxed, perhaps we may say fleeced, by him, and once, when viewed with some jealousy, wisely propitiated the king with the gift of

this castle of Somerton, or one of his strongholds, as a proof of his loyalty. 2. Why was this castle erected, and what was its character? No doubt to serve as a stronghold for national and personal defence, when every man, as far as he could, sought to make his house his castle, and thus to provide means of defence for himself, his family, his tenants, and property. Very possibly a Saxon stronghold, or defended house, existed here in Saxon times, as suggested by the name "Toothill," given to a close near the castle, and the existence of a mound, or watching elevation, on the western side of the castle site, which may have been actually the Toothill. But of this we are quite certain, that the castle, of which we now see the site and its remains, was built by Anthony Bec in the year 1281, or two years before his elevation to the See of Durham, when he obtained a royal license to "crenellate," or fortify, his house at Somerton, which seems to indicate that he had an "aula," or mansion, here, before he erected this castle. It consisted of an area of 330 feet long from north to south, and 180 feet from east to west, defended at each angle by a circular tower three storeys high, rising from an outspreading foundation, and surmounted by a plain parapet and conical roof. The curtain walls were of the same height as the angle towers, and enclosed a central court. Portions of two more of these towers remain, and the site of the fourth is well defined still. The basement storey of the north-eastern tower is polygonal in plan, lighted by five small slits, and beautifully vaulted by means of a central pillar and wall-corbels carrying twelve vaulting ribs, and happily the south-eastern tower remains quite perfect. This is 45 feet high, and contains a vaulted polygonal room on the ground floor, and two others above it, each having a small lobby attached to it. It has two chimneys, each containing two flues, which are early examples of such luxuries, as they were then considered. 3. For what was this castle famous? In answer to which I will say, we have all heard of the romantic imprisonment of Richard Cœur de Lion in the Istrian stronghold of Ténébreuse, but very few, comparatively speaking, have heard of the remarkable imprisonment of John, King of France, in Somerton Castle, and indeed so little was known of this until of late that Somerton, in Somersetshire, claimed to be the place of his captivity, instead of our Lincolnshire Somerton, which claim was actually allowed by some, but can now never be repeated. After the famous battle of Poictiers, fought September 20, 1356, and the capture of the great Suzerain of France by the Black Prince, he was brought to England in the spring of the following year, and lodged in the palace of the Savoy; but in 1359, when there was some danger of a French invasion, King Edward thought it prudent to remove the French king to a remote and central spot, and chose Somerton Castle for his residence, and Lord D'Eyncourt to be his custodian. Accordingly that nobleman conducted him from Hertford, and arrived at Somerton on August 4. He was accompanied by his son Philip, and forty-two attendants, amongst whom were two chaplains, a clerk of the chapel, secretary, a physician, a minstrel, three furriers, three wardrobe men, two cooks, a fruiterer, spicemen, barber, and washer, and, above most of these, "Master John, the fool." Here he remained until February 14 of the following year, when, after his captivity at Somerton Castle for six months and two days, and fresh fear of a French invasion arose, he was conveyed to the Tower of London, where he arrived on March 28. Eventually, on the payment of a large ransom, it will be remembered, he was allowed to return to France, whence he nobly returned on the flight of his hostages from his high sense of honour, which led him to say, "If justice and good faith should be banished from all the rest of the world, these virtues ought still to be found in the word and in the heart of kings," and he died in London in the spring of 1364. I am reminded by the Rev. H. T. Cordeaux, the present rector of Boothby Graffoe, that one of the bells of his church is an ancient one, dedicated in honour of St. Cuthbert, and hence may not improbably have been presented by Anthony Bec after he was Bishop of Durham, because St. Cuthbert is the patron saint of Durham, and as the manor of Somerton forms part of the parish of Boothby; and there are several references of gifts made in King John's account book to Boothby—spelt Boby by his secretary—such as 3 montons, or 12*s.*, given to the Curé of Boby for Masses offered for him at Christmas, 8*s.* at the Epiphany, and 4*s.* 4*d.* at Candlemas. The builder of the castle may in like manner have made the offering of one or more bells to the parish church of his castle of Somerton.

All Saints, Harmston.

The only old feature of this church is the tower, which from extreme antiquity is interesting, and especially as forming one of a group of coeval towers in and about Lincoln and Grimsby, all of which appear to have been built soon after the Conquest, probably by Saxon masons working under Norman architects. The late church here was built, apparently upon the foundations of its predecessor, in 1717, and this has now for the most part disappeared in its turn through its thorough restoration in 1868. Its features follow the fashion prevalent in the latter part of the thirteenth century, when plate tracery was commonly used in windows before a further development of such ornamentation occurred. Those who remember what the late fabric was have reason to rejoice at the change, and especially with regard to its present internal appearance, which is in every respect well fitted for Divine worship, although, as chiefly a modern church, it is not so interesting to ecclesiologists as churches of past centuries, but few of the older portions having been incorporated in the present structure.

St. Michael's, Waddington.

Without, this church is not attractive, and has been sadly marred by the re-erection of its tower in the last century, not on the site of the former one, but within the westernmost bay of the nave, which sadly shortens it. Within, however, it retains some beautiful features of the twelfth century, namely, its aisle arcades, each of three bays, and its chancel arch. The pillars of these arcades have boldly foliated caps of an attractive character, and one of them is encircled in the middle by a band, called a "baguette" by French ecclesiologists. The caps of the chancel arch piers are of the same date, but the carving of their foliation is of a stiffer character. The entrance to the lost rood-loft still remains at the east end of the south aisle. The font also is an interesting specimen of the same period. The pulpit is a good old oak one of the time of James I. On the north wall of the chancel is a mural monument, commemorating the Rev. John Barnard, rector of Waddington. He was born at Caistor, in Lincolnshire, and became rector of Waddington and Fellow of Lincoln College. He was originally a writer, but married the daughter of Dr. Peter Heylin, a strong Royalist and High Churchman, and was appointed chaplain to Charles II. He chose to write the life of his famous father-in-law, although the Heylin family had commissioned Mr. Vernon to do so; and a fierce quarrel ensued between them, described by the elder D'Israeli in his "Quarrels of Authors." He died at Newark in 1683. Until 1867 this church was afflicted by a gallery at the west end, lofty pews, and wretched aisle windows, having wooden mullions; but then all these were replaced by more appropriate features, greatly to the improvement of the fabric. The date of the communion plate is 1669, and the oldest date in the parish register is 1564.

PUBLIC WORKS IN TURKEY.

THE English Consul, Mr. Henderson, in his report to the Foreign Office on the condition of the province of Aleppo, writes:—As regards public works much money has been spent and many telegrams have been despatched announcing the building of schools, colleges, hospitals, mosques, &c., but all these projected edifices of usefulness and benevolence have been abandoned after the laying of a few courses of stone, to be completed at a distant future. Some progress has been made, and an enormous sum of money collected from the population for the Aleppo-Alexandretta Road. The completion of the road for carriages has been duly announced, accompanied as usual by a shower of decorations, but the road is totally impassable for wheeled vehicles, and as it is six hours longer than the old route, the mule and camel caravans do not travel by it. An English engineer officer of high position inspected the road in December, and he found that it would require many years of labour and a large expenditure of money before the road will be of much public utility. There are also grave engineering defects which must be remedied to enable carriage traffic to circulate with safety.

Mr. Dickson, the Consul at Damascus, reports:—No works of public utility were undertaken during 1885, but on the arrival of the new Governor-General of Syria at the end of last autumn, more attention was devoted to municipal improvements. Orders were given to repair the roads and to widen the streets in the city; and in several places the bazaars have been demolished in order to admit the easy circulation of wheeled vehicles. The process, however, of reconstruction has been slow, and much inconvenience has been caused by the accumulation of rubbish in the public thoroughfares. A plan for running a tramway through certain quarters of Damascus has for some time past been in contemplation by the authorities, but nothing was done last year towards carrying it out, nor is there any immediate prospect of the project being realised.

THE MANCHESTER EXHIBITION OF 1887.

THE following scheme has been adopted for the jubilee exhibition which it is proposed to hold next year in Manchester:—Section 1—Industrial design, as shown in textile fabrics, pottery, metal work, &c., original drawings for manufactures of various kinds, examples of ancient fabrics and designs, architectural designs. Section 2—Industrial processes, textile machinery, engineering and general plant, and machinery in

motion. Section 3—Chemical and collateral industries. Section 4—Handicrafts: Workers in brass, iron, wood, ivory, needlework, &c.; illustrating ornamental work in great variety. Section 5—Representation of Old Manchester and Salford, in which the handicraft work of section 4 is performed; model of Ship Canal, showing docks, locks, waterways, &c. The committee of this section to be the Works Committee. Section 6—Fine Arts: Paintings, engravings, sculpture, &c., produced during the Victorian era. Section 7—Botanical, flowers and fruit, fairy fountains, electric light, music, refreshments.

The best position available for the exhibition would appear to be land in the neighbourhood of Old Trafford, where several lines of railways converge, which would afford ample means of transport and communication.

The Liverpool Exhibition is on 58,000 square yards, and cost about 17*s.* per square yard. The Edinburgh Exhibition is on 39,950 square yards, and cost 16*s.* a square yard. It was begun and completed in six months. If we adopt 40,000 square yards as the area to be covered, and this it is thought will be sufficient, the cost of building at 17*s.* per square yard will be 34,000*l.*; sundry charges and contingencies, 6,000*l.*; maintenance, 40,000*l.*; advertising and electric lighting, 20,000*l.*; total cost, 100,000*l.* Admission money, 15,000 persons per day, open 150 days, 2,250,000 at 9*d.* each, 84,375*l.*; charge for floor and wall space, 15,000*l.*; income from refreshment contracts, 9,375*l.*; income from advertisements, 5,000*l.*; sale of old buildings, 7,250*l.*; total estimated receipts, 121,000*l.* The charge for admittance has been taken at 1*s.* each person, but as this includes excursionists, who would pay less than that charge, the average is estimated to be 9*d.* each person. It has been ascertained, after due inquiry, that an exhibition of the character above described can be satisfactorily organised so as to be ready for opening by May 1, 1887.

CHURCH BUILDING AND RESTORATION.

Bamber Bridge, Preston.—Recently three foundation-stones were laid at the chancel end of St. Saviour's Church, Bamber Bridge, near Preston. It is proposed to considerably enlarge this church by erecting new chancel, transepts, organ chamber, and vestry, and further improve and adorn the existing building from designs by Mr. T. Harrison Myres, A.R.I.B.A. (Messrs. Myres, Veevers & Myres), of Preston and Westminster. The works are being vigorously carried out by Mr. Charles Walker, of Preston, the total cost being about 3,000*l.*

Dalby.—The church of St. Mary, Dalby, has been reopened after restoration. The architects were Messrs. Demaine & Brierley, York; and the contractors Mr. Wood, mason, Skewsby; Messrs. Lacy & Son, carpenters, Skewsby; Messrs. Reid & Sons, joiners, Leeds; and Mr. George Hodgson, plumber and glazier, Hovingham. Mr. George Milburn, of York, carved the reredos, &c.; and Mr. Knowles, of York, supplied the lamps and fittings.

Edinburgh.—Plans of Mr. G. Washington Browne have been passed in the Edinburgh Dean of Guild Court for a new Presbyterian church at Morningside. The cost of the building is estimated at under 5,000*l.*, which will be seated for 750 persons. Messrs. W. Beattie & Sons are the contractors.

Good Easter.—The parish church, which was destroyed by fire last year, has been rebuilt and reopened. The work has been carried out by Mr. Walter Letch, builder, of Braintree, from the plans of Mr. F. Chancellor, of Chelmsford.

Herrington.—A new church, dedicated to St. Aidan, has been opened. The building has been erected from the designs of Mr. J. H. Morton, of South Shields. The builders were Messrs. W. Scott & Sons, of Sunderland. Mr. Charles Cobham acted as clerk of works.

Port Bannatyne.—A church built to supplement the parish church of North Bute has been opened. The architect is Mr. W. F. M'Gibbon, I.A., Glasgow, and the church is built at Kames Bank on the shore on the east side of the bay.

Repton.—The ancient church of St. Wystan, at Repton, has been reopened after partial restoration. The work has been carried out by Mr. J. Thompson, of Peterborough, from the plans of Mr. Arthur Blomfield, and Mr. Pemberton Leach, who have superintended the work.

Rhydycroesau.—The church of Rhydycroesau, near Oswestry, has been reopened after restoration and the addition of a chancel and vestry. Messrs. Davies Bros., of the parish, executed the joiner work, and Mr. Pardo, of Oswestry, the stone work. Mr. W. H. Spaull, of Oswestry, is the architect.

M. Charles Ferry is about to erect a house at the angle formed by the Cours-la-Reine and the Rue Bayard, Paris, which is estimated to cost 800,000 frs. The site is valued at 900,000 frs.

NEW BUILDINGS.

Cardiff.—On Wednesday last, the 28th inst, three memorial-stones of the Calvinistic Mission Hall were laid. The building is of a Gothic character, and consists of a hall 42 feet by 19 feet, accommodating about 400; and opening into same an infants' classroom, accommodating about 80; and minister's vestry. The contract is 924*l.*, and it is being carried out from the designs and under the superintendence of Mr. J. H. Phillips, architect, Cardiff. Adjoining the hall a large plot of ground is being retained for the erection of a chapel.

Durham.—The North of England Café Company's new premises in Sadler Street were formally opened on the 23rd inst., by the Lord Bishop of Durham. The premises have been entirely remodelled by Messrs. George Gradon & Son, builders, of Durham, and furnished, upholstered, and decorated by Messrs. Harland & Sons, of Bradford. Mr. H. T. Gradon, of Durham, is the architect who has had charge of the works.

North Malvern.—The memorial-stone of the new national school buildings has been laid by Lady Foley. At present only part of the scheme will be carried out, viz., that of erecting the boys' school, classrooms, and playground; and when further subscriptions have been received the remainder, a teacher's residence, will be built. The whole cost of the new buildings will be 2,600*l.*, and about 1,700*l.* has been subscribed. The contractor is Mr. T. Broad, and the architect Mr. H. Haddon.

GENERAL.

The Exhibition of Water-Colours by Deceased Masters at the Royal Institute in Piccadilly will remain open until Monday next.

Mr. Lewis F. Day has been invited by the Council of the Society of Arts to deliver a course of Cantor lectures in the autumn upon "Ornament."

Signor Morelli is at present engaged on a picture of which the subject is taken from the libretto of Verdi's yet unfinished opera, "Iago." Painter and composer are said to have entered into a solemn compact that no one is to know anything about the picture or its subject until the opera has been actually performed.

A Member of the Royal Academy is to be invited to assist in the selection and hanging of works submitted for the autumn exhibition of pictures at the Walker Art Gallery, Liverpool.

The Autumn Exhibition of works of modern artists will be opened in the Manchester Art Gallery on September 7.

A Sum of 700*l.* has been received in subscriptions for erecting in Dudley a statue of the late earl.

Mr. Stirling Lee's Design for the second panel of the bas-reliefs for St. George's Hall, Liverpool, has been approved of by Mr. Philip Rathbone, who was deputed by the Corporation to be the judge.

The Society for Graphic Arts, at Vienna, announce that on December 1 they will open, under the patronage of the Lord Chamberlain to the Emperor, an international exhibition of the works produced in engraving, etching, lithography, and the "chemico-technical" processes of reproduction, since the last exhibition held in 1883. Contributions, which should be sent before September 30, must be directed to the society's offices, VI. Magdalenen-Strasse, No. 26, Vienna.

The Rules for the competition for the new Municipal Buildings, in Edinburgh, having been revised, are adopted by the Lord Provost's Committee, and will shortly be issued.

Mr. A. E. White, assistant borough engineer of Hull, has been appointed to fill the office of borough engineer to the town.

The Middlesex County Magistrates have sanctioned the purchase of a part of the Claybury Hall Estate, Woodford, Essex, consisting of 250 acres, for 36,000*l.*, as a site for the building of an additional asylum for pauper lunatics.

Mr. K. F. Campbell, assistant borough surveyor of Salford, has been appointed borough surveyor of Stockton, at a salary of 350*l.* per annum.

The Ancient Parish Church of Rhosymedre, Ruabon, is to be restored and extended by the addition of a chancel.

The Dean and Chapter of Bangor Cathedral, having declined the offer of Mrs. Symes to place a screen in Bangor Cathedral as a memorial of the late Dean Edwards, that lady has decided upon the erection of a church at Glanadda, a populous suburb of Bangor. Mrs. Symes lately presented the reredos to the cathedral, in memory of her brother, Lieutenant-Colonel Holt.

The Foundation Stone of a hospital for Jews has been laid in Calcutta. The building is being erected and endowed by Mrs. Ezra in memory of her late husband.

Sir Matthew Wyatt, formerly lieutenant of the Corps of Gentlemen-at-Arms, died on the 19th inst., at his residence in Hyde Park Square. The deceased was a grandson of Mr. James Wyatt, the architect, who became Surveyor-general to the Board of Works, and was for a short time President of the Royal Academy.

The Architect.

THE WEEK.

The ten competitors for the Prix de Rome in the section of architecture were this year MM. Defrasse, Louvet, Delemer, Sortais, Leroy, Debrie, Lacoste, Laffilee, Despradelle, and Cousin. The subject allotted to them was "Un Palais de la Cour des Comptes." The prize has been won by M. Defrasse, who is a pupil of M. André, an architect who is very fortunate in sending out winners from his atelier. His son gained it in 1885. The premier second Grand Prix is obtained by M. Louvet, a pupil of MM. Louvet and Ginain. He was the third prizeman last year. The prize entitles the holder to the travelling scholarship of 40*l.* which was founded by the Duc de Cambacérès. The deuxième second Grand Prix goes to M. Sortais, a pupil of MM. Daumet and Giraud.

The student who gained the Grand Prix for sculpture is M. Paul Gabriel Capellaro, who is the son of a sculptor, and, like his father, a native of Paris. M. Larche obtained second, and M. Chavaillaud third prize. In engraving the three prizemen are pupils of M. Henriquel-Dupont (the engraver of the *Hemicycle*) and M. Cabanel. M. Patricot takes the Grand Prix with the 750 frs. left by M. Leprince and the 1,000 frs. left by the Duchess de Cambacérès; M. Granet came second, and honourable mention was made of M. Chiquet.

Mr. Henry Doyle, the director of the Irish National Gallery, generally contrives to secure at a very low price some interesting work from every picture sale where a bidder with a limited purse is out of place. From the auction of the Blenheim Collection on Saturday last he acquired for twenty-one guineas a family group which came from the hand of William Dobson, the English portraitist, who, on the death of Vandyke, was appointed sergeant-painter to Charles I. It consists of seven figures life-size to the knees, a lady dressed in blue, nursing a naked infant, the father leaning on a globe holding compasses, the grandfather behind, and other figures. Horace Walpole considered it to be one of Dobson's best pictures, and he conjectured that the father was Francis Carter, the architect. If so, the picture is of great interest. Carter was assistant to Inigo Jones, and is one of the artists mentioned by John Evelyn. He lived in Covent Garden, and under the Commonwealth was a justice of the peace and surveyor of works.

Mr. Henry Currey has examined the designs sent in for the proposed Fleming Memorial Hospital for sick children, Newcastle-on-Tyne. The first prize of 50*l.* is awarded to the design marked "Simplex," by Messrs. Quilter & Wheelhouse, of London; the second prize of 30*l.* to the design marked "Sweetness and Light," by Mr. Romthwaite, of Benfieldside; and the third of 20*l.* to a design by Messrs. Clark & Moscrop, of Darlington, marked "Civis." The building is estimated to cost 15,000*l.*

Mr. Kinross, of Edinburgh, has reported on the designs for the completion of the High School, Edinburgh. The plan recommended for adoption is by Mr. J. M. MacLaren, of Duke Street, Adelphi. The second prize is awarded to Mr. R. Walker, and the third to Mr. W. Simpson, both of Stirling.

We mentioned last week that Mr. Rathbone had approved of the second panel which Mr. Lee had prepared for the St. George's Hall, Liverpool. The City Council were not so easily satisfied. On Wednesday the confirmation of the proceedings of the committee was moved and seconded, but the meeting would not approve of their action. The two panels emblematic of *Education* and *Justice* were ridiculed. It will be remembered that the Liverpool architects long ago said that style of relief was not suited to the building, and their reward was a snubbing from Sir John Picton, F.R.I B.A. On Wednesday Mr. Rathbone could find no better way to defend the work of which he had approved, when sent to London, than by saying, "The young lady (*Justice*) he would admit was very simply and inexpensively dressed, but if the councillor waited for future panels he would find the young lady properly dressed. But she had not been to the dressmaker's yet." Advocacy of this kind, coming from a judge, was sufficient to settle the affair. There was a desire to decline the confirmation of the payment of the 150*l.* for the second panel, at the suggestion of the town clerk, payment was agreed to, but the terms of the contract are to be abrogated and no more panels will be taken.

The Victoria Hotel was again the subject of a long discussion by the Manchester Corporation on Wednesday last. Some time since the Council undertook to complete the large hotel on their property, which had been commenced by a company that expended about 120,000*l.* on the work before collapsing. The building occupied a prominent site, and it could not be left in an unfinished state. After a great deal of deliberation it was resolved to carry out the necessary works, and then to seek a tenant for the hotel. In a work of the kind it was difficult to foresee all the expense, and there was some grumbling whenever the contractors' bills appeared. At last the building was finished, and a tenant was found to take the hotel. The outstanding accounts or balances were furnished, and it was found that they amounted to 14,906*l.* 15*s.*, making a total of 103,250*l.* expended by the Corporation. The question arose how far that outlay was authorised. According to some of the Council the architect's estimate was 25,000*l.*, and no larger sum was voted. The chairman of the improvement committee says that statement is unfounded, for the figures were not adopted, and when the Local Government Board inquiry was held, the sum required for the hotel was said to be 57,000*l.*, and that was the authorised expenditure. It was soon found that the outlay must be increased to 69,500*l.*, and the improvement committee declare that there they stopped. For the remaining 33,750*l.* the chairman stated there was no act, vote or resolution, and in fact until the entire of the bills came in the committee had no knowledge of the excess. However, he proposed that the whole of the balance should be paid, without prejudice to any question between the Corporation and the architect, and that a "closed book" should be made of the affair.

It is self-evident that a Corporation could not become hotel proprietors without exciting much enmity. People who are concerned in a business of the kind, including publicans, naturally object to a rival for whose losses they will have to pay, and advocates of temperance dislike the enterprise almost as sincerely. That a bitter feeling was to be created was inevitable, and it has gone so far that, according to the chairman, "the damnification of the property was the object of some of those who had undertaken to speak and write on the subject." The difference between estimated and actual expenditure on the works has therefore been ascribed to a less excusable cause than a defect in foresight. "It had been insinuated," said the chairman, "that the excessive outlay beyond the contemplated amount was to be accounted for by peculation or corruption on the part of the members of the Council, the contractors, or the architect. He had not been able to find the slightest evidence of any irregularity of this kind. He had found nothing to interfere with the confidence he had in the entire honesty and integrity of the members of the committee, the contractors, or the architect." This statement rebuts a host of allegations. But when the chairman has a conviction of that kind, it seems extraordinary that Mr. Dawes should be made a scapegoat by the committee, as is done when in their report the excess of expenditure is described "as a matter between the Corporation and the architect," on which such action may be taken as is found necessary. The Corporation could not expect to be more fortunate than an ordinary client. A most difficult kind of work was undertaken, alterations were made from time to time, and in such circumstances it would be strange if there were no contingencies. The contractors are to be paid, and it would be wise if the "closed book" theory were carried out in full.

AN INTERDEPARTMENTAL COLLISION.

THE British taxpayer occasionally is offered a little enjoyment when two or more of the great spending departments fall out, and for the time his satisfaction is not affected by the thought that the ill-will between them may be costly to himself. An opportunity of the kind is now offered. It is true the transaction is a year old, but it is only this week the affair has been brought to light. The parties in it are the Science Department and the Office of Works, or South Kensington *versus* Whitehall Place. In other words, the two branches of the public service that are supposed to produce most admirable buildings, because they keep their doors closed against the civil architect. The row was over a scheme of building.

Every one knows by this time that from its creation South Kensington has made it plain that it was endowed with an infinite capacity for absorbing things. Like the sponge described by Hamlet, it is even ready to soak up the king's countenance, his rewards, his authorities. From time to time odds and ends were accumulated about the place, and as the authorities have a happy knack of devising titles, they came to be known as the scientific and technical collections. The things were not of much use, but it was satisfactory to feel assured that while they were stowed in the "Boilers" they could not be utilised by a rival educational establishment belonging to the service. Foreign visitors, who heard so much of the superiority of the English in applications of science, were dumbfounded when they saw the contents of the Patent Museum, the gallery of Building Appliances or structural collection, and the mechanical collections. Nor could their respect for us be restored by the naval models and the casts of fish.

The best proof of the absurdity of so miscellaneous a gathering is seen when we find that in spite of the dignified titles the Government at length became ashamed of what had so long existed under its authority. In the beginning of 1884 an Interdepartmental Committee was constituted "to consider and report upon the scope of the Scientific and Technical Collections," and "to suggest plans for housing these collections in the existing galleries to the south of the Horticultural Gardens, or in new galleries to be built upon their site, and the adjacent ground now the property of the Government." It was also suggested that the present collections might with advantage be "considerably weeded," an attempt at figurative language, by the Lords of the Treasury, which everybody would accept as expressive. The Interdepartmentals consisted of Sir Frederick Bramwell, Lord Lingen, Colonel Donnelly, R.E., and Mr. A. B. Mitford. Sir Francis Sandford was also appointed, but he attended none of the meetings.

It would be strange if so fertile a source of inquiry had remained unutilised until 1884. The fact was, that three years before the leading scientists attached to the Science and Art Department were invoked to undertake similar work. Having faith in the institution to which they belonged, these good men worked their brains to discover what was best to be done with the things that were to be found in holes and corners at South Kensington. They sent in a batch of reports, all duly signed, with their names and titles in full, and bearing the exact dates, according to the requirements. The reports were transported to the official pigeon-holes, there to keep company with many other documents of the sort, and the collections remained considerably unweeded as before.

The Interdepartmental Committee could hardly fail to recognise that the most laborious part of its work had been executed by the committees who were the authors of the entombed reports. "Considering that the members of these committees were selected," says the interdepartmental report, "on the responsibility of the Government, for their competence as authorities in their respective branches of science, and considering the detailed nature of their inquiries, we assume their conclusions as the basis of our recommendations." That is to say, an area of 120,000 square feet should be provided for the display of the collections, which have in general to be created, with provision for a further space of 40,000 square feet, which it was calculated must be required in the course of ten years.

The Treasury had indicated the site on the ground at the rear of the New Natural History Museum. Some of the galleries of the Exhibition of 1862 still remain there. The Interdepartmental Committee explored the land. The aid of Mr. Taylor, of the Office of Works, was obtained, and it was discovered that by an expenditure of 43,520*l.* the country could possess 80,200 square feet of flooring for the display of anything obsolete or otherwise which might be sent there. By paying a further sum of 54,183*l.* a building "with façades at the eastern end" would be obtained, with 33,750 square feet of additional space. But all this is inadequate, and it was explained how there was an opportunity for spending 125,100*l.* more without stirring from the strip on the south of the Horticultural Gardens. Altogether the outlay contemplated did not exceed 222,803*l.*, and the sum suggests the value of the existing scientific and technical collections in interdepartmental eyes.

All these discoveries were set forth in a report dated July 27, 1885, and, if it were not for three lines of a postscript, it might be supposed that the deliberations of the Committee were marked by the dulness that belongs to assemblies of the kind. It so happens that in this case the postscript is the most interesting part of the document, and for all we know to the contrary, it may be, as in the postscripts to ladies' letters, the most important. For who is able to foresee the extent of the reforms that might be accomplished if we could have South Kensington and Whitehall Place engaged in the gracious exercise of mutual improvement? In both regions there is room for much.

Whether a duel (on paper) between Mr. Mitford and Colonel Donnelly was contemplated when the Committee was organised, is a secret confined to the Treasury. It is evident that when the time arrived for action, Sir Frederick Bramwell and Lord Lingen prudently withdrew, and left the pair of representatives of the interdepartmental principle "to have it out" without interference. Such an arrangement may have been provided for.

South Kensington has enjoyed the special privilege of expending money on building, as if there was no Office of Works. It is only in accordance with the official spirit if, in Whitehall Place, there is an apprehension occasionally that the money is not laid out to the best advantage. Mr. Mitford, therefore, begins by suggesting that it is rather premature for the Science and Art Department people to think of erecting galleries of a length of 1 mile and 162 yards lineal measure on the west side of the Exhibition Road, before they have entirely removed all the ugliness of the Brompton Boilers from the east side, of which the public are getting tired. Gigantic galleries are a bad substitute for efficient control, or, as Mr. Mitford expresses it, "*proper management* will render the buildings on the east side sufficient for the legitimate growth of the Science and Art Department."

Having suggested the character of what is to be found on the east side of the road, Mr. Mitford crosses over to attack in another form, by explaining the nature of the illegitimate work which the Department hopes to enjoy one day. He says that the outlay will be double what is stated in the report. The scientific committees who first proposed the costly extensions were "for the most part professors in the Normal School of Science," and "prophets who have been invited to bless are seldom so uncivil as to curse." It is shown that the official scientists were engaged in carrying out the South Kensington policy of centralisation. What is the result of that policy hitherto? "I believe," says Mr. Mitford, "that the gradual encroachments of the Science and Art Department have been a misfortune. The accident of the close proximity of a number of half-occupied or unoccupied galleries has led to a system of squatting, to which all the power of the Treasury has been unable to put a stop." We fancy that Mr. Mitford must have written "flirting" instead of squatting (for the initiated say much use is made of museum and galleries for that form of study), but the latter is probably the more official expression.

The unkindest cut of all comes when Mr. Mitford expresses himself about the educational value of museums and galleries as administered by the Science and Art Department. He says that "practical gardening cannot be learnt by means of artificial flowers, nor farming by means of wax models." He says that "no man would engage a bailiff on the strength of a museum certificate," and no doubt means that the document is equally valueless for any

other kind of help. He says that a man cannot become a builder "by wandering through endless galleries of drain-pipes, specimens of terra-cotta, ironwork, and all the out-of-date and heterogeneous rubbish now in the southern galleries." He says that the uninitiated cannot learn all about naval construction from small models. He points out that there is no collection of burglars' tools for the instruction of policemen.

There are imaginative manufacturers who believe that their business is served by helping to fill up the dreary vacancies with some of their productions. Now Mr. Mitford may be said to be the largest patron of the building trade in all England, and he declares that no one would go there to be guided in the choice of goods, and that a projected museum, like the one existing, is, for business purposes, "utterly valueless and illusory." He concludes therefore that "it is no part of the functions of the State to provide gratuitous advertisements for traders, or stabling for the white elephants of inventors and companies."

Colonel Donnelly does not show himself to be as nimble-wristed in parrying as we should anticipate from an officer of his standing. He knows of old the worth of "My Lords" as a defence—for it has frightened many an unfortunate teacher. There is much to this effect:—"Mr. Mitford is surely aware that all the action of the Department and the communications on the subject have been under official sanction, and that, in fact, all the most important letters on this subject have been signed by the Lord President, &c." The Department has means of information which are of an occult kind, and the action of the authorities is shaped accordingly. The worth of the correspondents may be inferred when we find it stated that the country generally does not agree with Mr. Mitford when he slights the value of wax vegetables as a means of imparting instruction to agriculturists and the teachers who are let loose among them.

But more was to come. Mr. Pole, who has served on scientific committees without number, was taken aback by the two documents. He wrote a very modest letter to Mr. Mitford requesting him to attend a meeting where the two were to be considered. "I imagined," replied Mr. Mitford, "that the height of irregularity had been reached when it was proposed to attach to my report an *ex parte* criticism by another member of the Committee. Your present letter shows that I was mistaken." When circumlocution meets circumlocution then is the real tug of war. Regardless of allegations of irregularity from the other side, Mr. Mitford returns to the attack. One paragraph will suggest the position of South Kensington in a country abounding with Government departments:—

"Is it or is it not a fact that for some years past successive Governments have endeavoured to keep in check the encroachments of the Science and Art Department on the west side of Exhibition Road? That it has over and over again been peremptorily ordered by the Treasury to give up possession of the western galleries, and that as often it has refrained from doing so? The Department has most assuredly in this acted not only 'without authority,' but against authority, and when called upon to obey orders it has opposed to authority a dumb but active rebellion. During the last ten years I believe that every successive Secretary of the Treasury has visited South Kensington with a view to laying down boundaries for the Department; but the Department continues to overflow notwithstanding."

In his first statement Mr. Mitford alleges that the Department understates the estimates of cost, in his second he implies that the number of visitors is overstated. The galleries on the western side of the road are generally as desolate as the Ossianic halls. "According to Colonel Donnelly's showing," says Mr. Mitford, "there must be an average of some 500 visitors a day, all of whom have the gift of invisibility. This is miraculous."

South Kensington gets the worst in the controversy. But it is accustomed to that mode of treatment, and we might say has prospered by means of defeats. Indeed, Mr. Mitford has a misgiving that, in spite of his remonstrance, the money for the big galleries will be granted. Whatever may be the issue, we are, in this case at least, indebted to the Department for affording us so remarkable an example of the amenities of official life.

PHIDIAS.*

THE modern critical spirit, which has shown little reverence for so many sacred and profane things, is compelled to be respectful before the works ascribed to Phidias. Nor is it difficult to discover the reason. There is always a pathetic interest about ruins, but there are no ruins to compare with that sculpture. We see them in Bloomsbury exiled from their original position. Many of the figures are wrecks, and so much of the external surface has suffered that probably not a square inch corresponds with the state in which the work left the sculptor's hands. Yet in spite of all the injuries which time and man have inflicted on them, and in spite of our ignorance of their meaning, the Parthenon figures can make an impression deeper than any other work in marble. What must have been thought of them when they were first revealed in all their glory to the Athenians?

The name of their supposed author is inseparably united with the history of humanity, for Phidias, or whoever produced the work, is one of the tokens of the capability of the species. When we stand before his work we seem to have a revelation of his qualities, and to be brought into contact with him. It is only when we try to put our knowledge into shape that we discover how little is recorded about Phidias, and in consequence writers have been compelled to imagine what kind of man he was from the evidence of character which is afforded by the figures.

The earliest and the principal sources of information about him are the allusions by Plutarch and Pliny, and when they wrote Phidias must have been dead for about five centuries. If we try to write a history of one of the great men of the fourteenth century, we may realise the difficulty of their task and the worth of their record. In some others of the Classic authors his name is occasionally mentioned, and scholars have from time to time sought after more references; but when all the materials are brought together it is found that nothing is recorded about the greater part of the sculptor's life.

As time goes on the works of Phidias will be more appreciated, and past failures will not deter authors from trying their hands on a biography of him. They know the world wants such a work, and the difficulty of the enterprise has a fascination for an inquirer. We are, therefore, not surprised when we find M. Maxime Collignon undertaking the task, and with the hope that the recent investigations by French, German, and English investigators, when co-ordinated, may afford something which, if not authoritative, will, at least, be probable and consistent. The book which he has written is a masterly summing up of all that is known on the subject, and a study of it will help people to a truer comprehension of the sculpture, if it does not tell them more than they knew about Phidias himself.

The best plan to adopt when attempting to write the life of a man or the history of a period, when there is insufficient evidence, is that adopted by Augustin Thierry in his "Récits des Temps Mérovingiens." It might be called the cross-sectional method. Incidents are related which seem to have happened, and which may be taken as corresponding with others of which there is no record. This method resembles in a great measure that which is employed on the stage, for the dramatist only gives us a series of detached scenes, and leaves us the task of connecting them. Now, following tradition, which it must be admitted is not always trustworthy, let us see if one can obtain a few glances of Phidias.

If we assume that Pausanias made a correct copy of the inscription on the base of the statue of *Zeus* at Olympia, it will follow that Phidias was an Athenian, for it said, "I was made by Phidias, the son of Charmias, an Athenian." It is necessary to guess about the year he was born. The great works of the Parthenon were probably undertaken about the year B.C. 447, and placed in charge of the sculptor. He would hardly be placed in a position of that kind if an objection could be raised against him on account of his age. Supposing that he was forty at the time, the year of his birth would then be B.C. 487. As Phidias is

* *Phidias. Par Maxime Collignon. Ouvrage accompagne de 45 gravures.* Paris: J. Rouam. London: Gilbert Wood & Co.

supposed to have began as a painter, it is inferred that his father Charmias was likewise one. There are vases of high quality bearing the name of Charmias, and M. Longperier has suggested, but timorously, that they may have been designed by Phidias, and placed by him, as it were, to his father's credit. There was another son named Panainos, who was also a painter.

Under what circumstances he gave up painting for sculpture, and who were his masters, must remain subjects for speculation. It is supposed, on the authority of an anonymous scholiast, that Agéladas the Argive was one of his teachers, and M. Beulé imagines that the earliest commission to Phidias—a statue of *Athené* in ivory and gold for the town of Pellene—may have been given on the recommendation of that master. It is evident from what was said by Cicero, that in his time it was believed that if Phidias could be said to have had a speciality, it was for representations of gods and goddesses. This is supported by the statement that when a bronze statue of *Athené* was ordered as a sort of thank-offering for the success of Athens against the Persians, Phidias was employed to undertake the work. The representations of the statue that are seen on coins do not suggest more than an archaic figure, and if the soldiers of Alaric were scared by its appearance, they must have been very simple children of nature. On one of the coins the statue appears about once and a half the height of the Parthenon, and in modern restorations of the Acropolis it is seen overtopping all the structures. M. Michaelis considers that the height, including the base, could not have been more than 30 feet.

The titles of a great many statues ascribed to Phidias are to be found in Roman writers, but there is nothing to denote the time of their production. His appointment to the direction of the Parthenon is, however, evidence of his position as an artist, although the stories of his wonderful realistic fish and flies are only fictions.

It is remarkable that nothing remains in literature, not even a fiction, which enables us to realise the Phidias of the period prior to the construction of the Parthenon. When the great works were agreed upon we find him enjoying the friendship of Pericles, the first man in Greece, and possessed of the knowledge that was required in a general director of works. The Athenians possessed able architects and clever workmen at the time, but Phidias, says Plutarch, was appointed to take charge of all the public edifices, and it was to him the artists came for instructions.

Whether the words mean other works besides those of the Parthenon cannot be ascertained. If his superintendence were confined to the temple, the office would be no sinecure. But in addition Phidias was a sculptor, and as such must have wrought the marble with his own right arm. Was it possible for any one man to possess the superhuman power that was required to carry out so much work in the efficient manner that is apparent to all? It would be invaluable if something could be discovered which might reveal how Phidias disposed of one of his days, or to what extent his superintendence was accepted, but we must be content to remain in the dark. It is evident that there were able sculptors employed under him, and we can hardly imagine them sacrificing all their individuality at his command.

The difficulty is increased if we consider also the production of the statue of ivory and gold for which the Parthenon served as a shrine. According to the legend related by Valerius Maximus, and one is grateful for some touch of nature in respect of Phidias, the sculptor recommended that it should be formed of marble, as the material would allow of a permanent polish. The Athenians listened to that reason in patience. But when Phidias said that marble was preferable on account of its cheapness, he was ordered to be silent. This story may have no more sound foundation than many others relating to Phidias, but it suggests that he was recognised as a sculptor, and there is nothing of the kind forthcoming to suggest his appearance as an architect.

Now the question arises, how long must that chryselephantine statue of *Athené* have taken to construct? The best answer that is forthcoming will be afforded by the reproduction which was made by the spiritualist sculptor, Charles Simart, at the instance of the Duc de Luynes. It was the work by which the artist was represented in the International Exhibition of 1855. That copy took six years to execute. We cannot suppose that Phidias's statue was completed in a less time, and if so, only three years would remain to carve the great frieze and the pediments of the Parthenon!

It is surprising that while the statue of *Athené* is closely connected with the fate of Phidias, there is no evidence by which his name is associated with the sculpture of the Parthenon. Plutarch relates the story of the statue, but says nothing about the frieze or pediments. Pausanias does not mention the name of the sculptor when describing the sculpture, whereupon Visconti, with the logic that characterises connoisseurs, concludes that the omission was caused by the supposition of the artist being universally known. Aristotle says Phidias was a wise sculptor of marble, but does not mention any work as an illustration. It would be dangerous to deny that Phidias may have designed the whole of the sculpture, although the only ground for the belief is the short statement of Plutarch about the superintendence. And the value of it is lessened by the absence of any record of a group by Phidias. All his panegyrists among the ancients esteemed him as a sculptor of single figures.

M. Collignon is not disposed to be sceptical about the position of Phidias, but there is one passage in his chapter on the pediments which suggests that for once at least he was unable to resist the doubt which must arise in the mind of everybody who is not controlled by a sort of superstitious faith in the omnipotence of the sculptor. He says :—

> The study of the pediments must excite a still more urgent question, viz., what part was taken by Phidias in the conception and in the execution of these vast collections of figures? Assuredly it would be puerile to recognise in every part a master's hand. However prodigious may have been the activity of Phidias, can we imagine him carving more than forty figures, on a scale that is larger than life, at a time when the execution of the Parthenon and the practical superintendence of the works of the Acropolis demanded his power and attention? What man could sustain so gigantic a task? Recognising the force of these objections which he himself formulated, Beaulé has supposed that Phidias executed only the eastern pediment, and left the decoration of the western to Alcamenes. But this is only a conjecture and nothing has been found to justify it. The solution of the difficulty is only to be found in an examination of the marbles of the Parthenon. We are at first struck with the perfect unity of the two compositions and the differences often notable in the execution of the figures. In the two pediments we recognise the same spirit in the grouping, in the movement of the drapery. It is entirely new, and marks a reaction against the timidity of the ancient schools. The style of the figures is, however, far from being uniform. In one place the handling is bolder and quicker, as in the *Hercules*; elsewhere there is tenderness of execution, as in the *Cephissus* (Ilissus); sometimes, as in the *Iris*, a model less supple and thinner. That several hands were engaged on the figures we cannot well doubt; but what is more natural than to attribute the scheme for the two pediments to Phidias alone? That is the solution which appears probable. We can easily imagine Phidias determining the plan of the pediments, modelling the figures in clay, and distributing the task of their execution in marble among the sculptors in his atelier. We can even go further, and recognise the master's own hand and chisel in such parts as the group of *Déméter and Coré* (that of *The Graces*) and the *Cephissus*. In matters of art feeling is a better judge than the reason, and before these figures can we help pronouncing, as if by instinct, the name of Phidias?

The subject of the great frieze is likely to afford opportunity for controversy during a good many years to come. In none of the ancient writers is there any clue to its meaning. For centuries it was difficult to reach Athens. A traveller who visited the city in the fifteenth century described the frieze as a representation of the victories of Pericles. In the seventeenth century Spon and Wheler said it consisted of sacrifices, processions, and other ceremonies of heathen worship. Chandler said it was a sacrifice by the cavalry of Athens. Stuart seems to have been the first who declared it to be a Panathenaic procession, and his notion has been most generally accepted. M. Collignon agrees with it. He follows Brunn and Flasch in supposing that the bearded figure at the end of the eastern section, who holds folded stuff in his hand, is, however, a priest who is about to offer sacrifice, and has divested himself of his himation, which he carefully folds

and gives in charge to an attendant. According to Visconti and others, the figure represented the chief archon, who was receiving the peplos that had been borne in the procession. This being one of the figures that is engaged in a peculiar action, it has therefore so much significance that it might be said to form a key to the meaning of the frieze. But if the priest is not receiving a peplos, how can the frieze represent a Panathenaic procession, which was supposed to accompany the bearers of the sacred veil? There is no other peplos in the frieze. M. Collignon tries to get over the difficulty by saying that Phidias took an artist's liberty in selecting what suited his purpose. That is not, however, a convincing explanation.

The story which is recorded by Plutarch was to the effect that Phidias suffered from the uncertainty of public favour. He was accused by one of his own men of dishonesty in keeping some of the gold intended for the figure of *Athené*, was cast into prison, and there poisoned. Another legend is no less tragic. According to this version the sculptor was lent to the people of Elis for the purpose of making a statue of *Zeus*, on condition that Athens was paid a large price. He finished the statue, but, as the money was not forthcoming, the people thought it easier to accuse him of robbing them of gold, and cut off his hands in punishment for the sacrilege. Is either story to be believed? M. Muller-Strubbing considers that the later legend should be read in this way. "Phidias, having been tried for false accounts and acquitted, left Athens for Elis, where he undertook a statue of *Zeus*. After its completion he died in the city, and was mourned by the Elians." It matters little now which version approaches the truth, but there would be more of justice and fitness in Phidias finding a retreat in a sacerdotal city, and spending the evening of his days in fashioning a figure that might realise the Homeric ideal of the chief among the gods.

We have of that statue some evidence, but the description of Pausanias hardly corresponds with the figure that is found on Elian coins, and among the latter there is variety. Jove sat in his chair holding in one outstretched hand a figure of *Victory*, and in the other the long sceptre used by kings and heralds; but it is impossible to say how the gold and ivory were disposed. The height of the figure is supposed to be about 45 feet. The statue was separated from the rest of the temple by a veil. It is now known that Antiochus IV. presented a costly one to the temple, and it is conjectured by M. Clermont-Ganneau that it was the veil which hung before the tabernacle in the Temple of Jerusalem.

The fate of the statue is unknown. After being one of the wonders of the world, it is not surprising that Caligula should attempt to carry it away to Rome. It was, however, protected by the Thunderer, and the attempt was followed by the death of the Emperor. A Byzantine writer stated that it was afterwards brought to Byzantium, where it remained until A.D. 475; but little reliance is placed on the story.

The book of M. Collignon is one of the most valuable in the series of the "Artistes Célèbres," and there is no book of its size and price which conveys a better idea of the position which Phidias holds in the world of art. The author is not an upholder of any startling theory, and he does his best to elicit from those which exist whatever appears to be probable.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

On Saturday afternoon some members of this society visited the neighbourhood of Keighley. The Mechanics' Institute, Art and Technical School (now undergoing enlargement by Messrs. W. & R. Mawson, architects, of Bradford) was first visited, and the clerk of works (Mr. T. A. Sugden) conducted the party over the works. West Ryddlesden Hall, an Elizabethan structure, owned and occupied by Mrs. Sidgwick, was, through the courtesy of that lady, next inspected. Afterwards East Ryddlesden Hall, known locally as "Old Ryddlesden Hall," was, by the kindness of Mr. Bailey, the tenant, thrown open to the visitors. The latter house is a good specimen of the transitional period of the Renaissance, and in its essentials remains in its original form.

HEBBURN HALL.

At the last meeting of the Newcastle Society of Antiquaries a paper was read by Mr. F. R. Wilson, architect, on a stone heraldic panel and other relics discovered at Hebburn Hall, near Newcastle-on-Tyne. He said:—The society need not be informed of the history of Hebburn Hall, but to elucidate the discovered fragments that I now exhibit to you, I desire to quote what Surtees says concerning it:—"The old mansion house was built with some view to defence, trenching on the castle like the Border towers. Whether it was the military and predatory aspect which naturally reminded the citizens of the horrors of the Border wars, or the imposing situation of Hebburn-on-Tyne, or rather, the Popish tenets of its owners, the place seems to have been from the Dissolution till the civil wars (during the possession of the Hodshons) the frequent object of jealousy and suspicion to the peaceful burghers of Newcastle. The Hodshons first obtained it in 1562. The estate of Hebburn passed by purchase about the year 1650 to the ancient and respectable family of Ellison. The mansion was nearly rebuilt about 1790. Part of the old mansion remains on the west." In the rebuilding and in forming the large mansion in 1790 that now exists all traces of the castle or pele tower and of the mansion of the Hodshons were then effaced, except one thick wall which I detect to the west of it, shown upon my plan. The mansion is a spacious erection of three storeys, in the Italian-Vitruvian style that was then in vogue. In the rear of it, and at right angles with it, is a wing of buildings, about 150 feet long by 32 feet wide, which contained the kitchens, larders, laundry, brewery, and a floor of servants' bedrooms over. The style of this wing was of the very plainest, with no feature whatever about it, except a curious clock that had a face to the courtyard, and another one in the internal servants' passage. Tyne progress, Tyne chemical factories, and Hebburn industries have caused the occupation of Hebburn Hall to be gone. And for the rising, increasing, working population the new parish of St. John has been recently formed, in which this hall stands. To provide a church for the parish it has been decided, with the sanction and material assistance of Mr. Carr-Ellison, the present owner, to convert this wing into one. This conversion is now going on. In the process, several ancient stones have been found. Several pieces of mullions and sills of the early tower have come to light, and also the very perfect stone-carved coat-of-arms, which I now exhibit to this society. Miss Carr, of Dunston Hill, has ascertained for me as follows:—"The arms on the Jarrow tombstone (1617), and, therefore, presumably the 'find' at Hebburn, are, as the Rev. T. W. Carr shows me, those of Sir Robert Hodshon himself, his wives, &c. The arms are those of the Hodshon who married an Ingilby, daughter of Neville." Some carved scroll pieces which we have also found, and which I produce, form, I conceive, portions of a large heraldic panel which formerly adorned the front of the mansion in the Elizabethan period. These discoveries show what strange changes buildings undergo in the march of time. When the pele tower was standing it commanded a wide expanse of country, and it looked defiantly northwards towards Scotland, and to the southwards over the county of Durham. The ancient and respectable family of Ellison effaced and hid all traces of it in the mansion they erected.

A cordial vote of thanks was accorded Mr. Wilson.

Mr. S. Holmes read a paper on the "Roman Baths at Cilurnum," and was cordially thanked for the same.

The Secretary, in the absence of Dr. Bruce, read a paper by that gentleman on "Two Roman Inscriptions recently discovered in Cumberland—one at Birdoswold, and the other at Harrington, near Moresby."

A hearty vote of thanks to Dr. Bruce was passed, and the proceedings shortly afterwards terminated.

PROPOSED ART GALLERY FOR LEEDS.

The members of the Special Committee of the Leeds Town Council, appointed to report on the practicability of providing a permanent art gallery and museum for Leeds, have issued their report to the members of the Council. They state that they have held eight meetings, and devoted much time and attention to the inquiry. There has been no division of opinion amongst them as to the desirability of establishing a permanent art gallery and museum for the borough. The committee believed that such an institution would prove a great source of refined enjoyment for the people, and be an important addition to the educational advantages of the town, while they entertained no doubt that if the Corporation provided a suitable home for art treasures, it would soon attract gifts from the citizens of Leeds, and become the nucleus of an increasingly valuable collection. Indeed, since the matter had been brought forward, a very interesting collection of engravings had been presented to the borough by Mr. Howgate, and a con-

siderable sum had been promised through the chairman (Councillor Harding), to be expended in the purchase of works of art for the new Municipal Gallery. When the subject was brought forward at the Council meeting on April 8, Mr. Ambler suggested that the necessary funds for the provision of a gallery could be obtained without throwing any additional burden on the ratepayers, by drawing upon the penny rate levied under the Libraries and Museums Acts, the whole of which had hitherto been exclusively devoted to the purposes of the library. Some members of the committee, however, were anxious to go outside the penny rate, and in consequence of this feeling the town clerk was desired officially to ascertain how the outlay on art galleries and museums had been met in other towns. The report was to the effect that the expenditure had generally been limited to the penny rate, and that where this limit had been exceeded it had been done in virtue of special Acts of Parliament. Taking all the circumstances into consideration the committee could not advise the Council to go to Parliament for a special Bill, and they believed that in the present condition of trade the ratepayers might not approve the erection of a costly building on a conspicuous site. Anxious not to postpone indefinitely a most necessary work, the committee had turned their attention to the original suggestion that the proposed gallery should be provided within the limits of the existing penny rate. After careful consideration they had come to the conclusion that from the proceeds of the penny rate at present levied under the Libraries and Museums Acts, the sum of 800*l.* per annum might with great advantage be applied to the purposes of an art gallery and museum. The committee point out that after deduction of the 800*l.* per annum proposed to be diverted, there would still remain about 4,200*l.* from the rate, which, with the present scale of income from sales and fines, would leave available 4,500*l.* to 4,600*l.* per annum, a sum which should be sufficient to maintain in efficiency a library already established and largely stocked with books. Turning their attention in the next place to ascertain whether anything worthy could be accomplished within the limits of the 800*l.* per annum proposed to be expended, the committee consider that of this amount at least half, say 400*l.* per annum, would be required for working expenses; so that, therefore, 400*l.* would be available to pay interest and sinking-fund charges on the outlay upon buildings. This 400*l.* per annum would permit of an expenditure of over 8,000*l.* upon buildings; and for this sum the committee believed that considerable results could be obtained upon the site contiguous to the Municipal Buildings, and already in the possession of the Corporation. The committee considered this site excellently adapted to the purpose, because of its central and quiet position, because its situation at the back of the Municipal Buildings rendered ornament and expense in the exterior of the new structure unnecessary, and because by approaching the new buildings through the existing news-room (a fine hall unsuited to its present purpose, but admirably adapted for a sculpture gallery and museum), the art galleries would really form part of the Municipal Buildings, and be worthily approached through them. No alterations to these buildings were proposed, beyond making a broad doorway at the end of the news-room to connect with the hall of the picture galleries. The new reading-room to be provided would be larger than the present one, and amply lighted on both sides. In the opinion of Mr. Ambler and Mr. Tweedale, the whole of the buildings could be completed for a little over 8,000*l.*

TESSERÆ.

How Berlin was Built.

THOMAS CARLYLE.

THIS year (A.D. 1731), says Fassmann, the building operations in Berlin and Stettin were exceedingly pushed forward. Alas! yes, this too is a questionable memorable feature of His Majesty's reign. Late Majesty, old King Friedrich I., wishful, as others had been, for the growth of Berlin, laid out a new quarter, and called it Friedrichs Stadt—scraggy, boggy ground, planned out into streets, Friedrichs Strasse the chief street, with here and there a house standing lonesomely prophetic on it. But it is this present Majesty, Friedrich Wilhelm, that gets the plan executed, and the Friedrichs Strasse actually built not always in a soft or spontaneous manner. Friedrich Wilhelm was the Ædile of his country as well as the drill sergeant. Berlin city did not rise of its own accord, or on the principle of leave alone, any more than the Prussian army itself. The number of scraggy waste places he swept clear, first and last, and built tight human dwellings upon is almost uncountable. A common gift from him (as from his son after him) to a man in favour was that of a new good house—an excellent gift. Or, if the man himself is able to build, Majesty will help him, incite him. "Timber enough is in the royal forests; stone, lime are in the royal quarries; scraggy waste is abundant: why should any man of the least industry or private capital live in a bad house?" By degrees, the pressure of His Majesty upon private men to build with encouragement became considerable, became excessive, irresistible, and was much complained of in these years to come. Old Colonel Derschan is the king's agent at Berlin in this matter; a hard, stiff man; squeezes men, all manner of men with the least capital till they build. Derschan, with his slow screw machinery, is very formidable, and Büsching knows it for a fact "that respectable Berlin persons used to run out of the way of Bürgermeister Koch and him, when either of them turned up on the streets!" These things were heavy to bear. Truly, yes; where is the liberty of private capital or liberty of almost any kind on those terms? Liberty to *annihilate* rubbish and chaos, under known conditions, you may have, but not the least liberty to keep them about you, though never so fond of doing it. Berlin itself, and some other things, did not spring from free trade. Berlin city would, to this day, have been a place of scrubs ("The Berlin" a mere appellative noun to that effect) had free trade always been the rule there. I am sorry His Majesty transgresses the limits; and we, my friends, if we can make our chaos into cosmos by firing Parliamentary eloquence into it, and bombarding it with Blue-books, we will much triumph over His Majesty one day!

Architectural Drawings.

W. BURGES.

At the end of the last century, and at the beginning of the present, the fashion was to make drawings in fine lines tinted with Indian ink. At the revival of Mediæval art a favourite way of sketching was to outline in pencil and tint up with Indian ink or sepia. Most of Mr. Blore's drawings are done in this manner, and are so surprisingly and minutely finished, that they give the idea of very clear photographs. But before this the custom of offices was to make the drawings simply in thin lines, and then to back-line them, a practice destructive of all breadth of effect, and absolutely perplexing to the eye. The elder Pugin's works are specimens of this style, which, I am happy to say, is nearly obsolete. The younger Pugin brought the first change to the system in his plates, where he, on the contrary, made things look too well by his marvellous etchings. Indeed, there is a fizziness and an action in all his plates which you look in vain for in the real thing. The present system of etching up a drawing is an offshoot from this style, and is, I am afraid, open to very nearly the same objection. We have to thank competition committees for its use, who, forbidding the employment of colour, have obtained a much more seductive style of perspective, for I think I would any day back a good etched drawing against a coloured one. But after all, the success of a design in stone and mortar must depend upon the working drawings (for nobody sets out work or chisels stone from perspectives), and it is in those that I hope to see strong, thick, bold lines employed, so that we may get into the habit of leaving out those prettinesses which only cost money and spoil our designs. But after all, no amount of architectural drawing would make a man an artist or an architect—for they are one and the same thing—unless he makes a complete mastery of the human figure. When the profession generally begin to draw the figure, and make bold architectural drawings, and generally to think for themselves, instead of going to past ages and precedents, we may then hope to have an architecture.

Renaissance Treatment of Exteriors and Interiors.

S. SMIRKE, R.A.

In the works of Bramante and Peruzzi, but perhaps more especially of the latter, a degree of interior ornamentation was indulged in that might to our cold northern tastes appear almost excessive, and which we should probably be disposed to condemn were the excesses not redeemed, and I may say in most cases fully justified, by the extreme beauty of these ornamental details, and by the judicious treatment of them. Nothing, for example, can well exceed the elaborate elegance of the decorations of the halls and corridors of the two Massimi palaces at Rome, which I own struck me as among the most finished studies of interior architectural composition that I had ever seen. The rapid advance made towards the perfecting of the new style is rendered remarkably apparent by a comparison of the ornamental details of Bramante's Cancellaria with those of the highly-finished works of Peruzzi. Now if we look to the exterior of these same buildings we shall find the most marked difference of treatment. A general abstemiousness prevails in respect to mere ornamentation. The evidences of care and study in the composition of the leading forms as well as of the details are quite as apparent outside as within. There is not a moulding that does not bear the impress of thought and care; but you will find breadth and simplicity the chief objects aimed at throughout, whether in the principal features or in the minor details. It is clear that these great masters, with one accord, were wont to say to themselves, "We will indulge our love of the beautiful on the walls and ceilings of our saloons and

corridors, where the eye has leisure to dwell upon them, and where, sheltered from the vicissitudes of the seasons, our cunning intricacies and our mimic foliage may endure, and be a permanent source of pleasant contemplation for future generations; but we must, in our exterior work, have regard to the altered circumstances of position. A building cannot be very critically examined, or even seen with convenience, from a very proximate point of view: the eye must be moved to some distance in order to appreciate or comprehend the design of the exterior when the building is large. It is not, then, in these elaborate details that we can hope to win the applause of cultivated critics; for in truth such details will be too far off to be seen. We must rather have regard to the *ensemble*, to pleasing outlines, to variety of light and shadow, to symmetrical arrangement of the several parts. Such are the considerations that must be foremost in our minds whilst we are designing external architecture. If we introduce on the outside the minute and intricate ornaments in which our fancy disports within, we shall find the breadth of our lights broken up, and their effect destroyed. We shall be inviting attention to details the merits of which will be unappreciated, and run the risk of losing the labour we have bestowed on the general composition, which may perchance pass unheeded by the eye, distracted in its attempts to examine unimportant minutiæ. Besides, architecture is a material of art; it deals with substantial realities, and is wholly dependent on static laws. Moreover, if we break up and obliterate our bounding lines, we shall deprive our work of the special character of architecture, and destroy its idiosyncrasy. It behoves us too to reflect that by raising up a structure composed of trivial littlenesses, and overlaid with festoons of little leaves and flowers and ribbons, or crowded with crockets, finials, and intricate corbelling, and by fretting the surface over with niches and imagery, and so forth, we shall be setting the elements against us. We shall find that the rain and the frost and the invisible chemical atmospheric agencies for ever acting with determined hostility against the substances we work in, will ultimately—possibly slowly, but perhaps rapidly, at all events most surely—render our sculptural labours nugatory, and perchance indeed annihilate our building; and if those who follow us are not perpetually employed in renovating our work—patching and mending, restoring or renewing—our structure will inevitably become a picturesque ruin, the established residence of bats and owls." Such may have been the reasoning of those experienced, thoughtful, and sagacious masters who ruled the destinies of our art at the end of the fifteenth century.

Gilding in Decoration.

J. Ballantine.

The effect of gilding on an apartment, when judiciously introduced, is highly poetical. It gives a new and more elevated character to everything in the room, while, without it, the finest designs look tame, flat, and insipid. Gold ought to be employed liberally in adorning cornices; and in almost all cases the primary colours can be used in connection with it in their fullest intensity with excellent effect. On the other hand, the richest furniture loses half its effect when placed in a room in the decoration of which no gold has been employed. Under the influence of artificial light, gilding becomes still more imposing, and at all times, and in all places, the effect is exceedingly agreeable.

Primaries, Secondaries, and Tertiaries.

Owen Jones.

If we examine the remains of the architecture of the ancients, we shall find everywhere that in the early periods the prevailing colours used in decoration were the primaries blue, red, and yellow, the secondaries appearing very sparingly. We find this equally in the remains of Nineveh, Central America, of Egypt, and Greece; and throughout the Eastern civilisations generally we find also everywhere that, as time wore on, the secondary colours invading the dominion of the primaries, blue and red were supplanted by green and purple. In Egypt, in the temples built by the Pharaohs, blue, red, and yellow mainly prevail, while in those built by the Ptolemies the greens and purples take their places. In those of the Roman period colours are still further degraded to a dull and incongruous muddiness. In the great temples, as far as we can gather from the few remains of colour we have, the same law prevails, while in Pompeii we find the secondaries as the ruling harmonies. In the Alhambra the blue and red of the Moors were painted over with green and purple by Charles V. and his successors, and with the worst effect. In modern Cairo, and the East generally, we have green constantly appearing side by side with red, where blue would have been used in earlier times. It is equally true of the works of the Middle Ages. In the early manuscripts, in the stained glass, though other colours were not excluded, the primaries were chiefly used; while in later times we have every variety of shade and tint, and rarely with equal success. It would seem either that the human mind, ever seeking for change, became weary of the simple harmonies which the primaries afforded, and sought more complicated effects from the secondaries and tertiaries, or that it arose from the decline of art and the incapacity of the artist to deal with the primary colours in their pure state, who took refuge in the secondaries and tertiaries, where error in the balance of colour was less fatal, although to produce a perfect harmony with the secondaries and tertiaries is much more difficult. Among modern examples of the use of colour we may cite the royal chapel at Munich, where blue, red, and gold form the principal harmonies, as far superior to the other churches of the same city where the secondary and tertiary colours prevail. At Paris, in the church of St. Vincent de Paul, decidedly the most perfect specimen of modern decorations in any country, the colours are blue, red, and gold, separated by white. This church contrasts admirably with the decorations of St. Denis, St. Germain des Prés, and other churches of Paris, where the secondaries and tertiaries prevail. When the secondary colours were used, in the best periods, in conjunction with the primaries, they were generally confined to the lower parts of the building; following in this nature, who uses for her flowers the primaries, and reserves the secondaries for her leaves and stalks.

Timber for Farm Buildings.

J. Ewart.

The best timber for building purposes is fir from Norway, and, whenever it can be obtained at a moderate expense of carriage from a seaport, it should have a preference to any British grown timber in the construction of farm buildings. The expense of carriage from a great distance, however, may preclude its use; in which case, a selection must be made of the best that can be obtained in the neighbourhood. The heartwood of mature oak is, from its strength and durability, unquestionably the best of British-grown timber for all building purposes; but its great value precludes its use in the construction of farm buildings. The wood of young oak trees, and of branches, from the great proportion of sap they contain, rapidly decays, and is therefore quite unfit for use in any building of a permanent nature. Spanish chestnut, when the trees have not attained a great age, is considered almost equal to oak for building purposes; but the timber of old trees is brittle, and becomes much impaired in strength. Ash, from its want of stiffness, and its liability to rot, is unfit for building purposes. Elm is much inferior in most of its properties for building purposes to either oak or chestnut; almost its only merit is its durability when not exposed to alternate wet and dry. The timber of all the species of poplar is useful for many building purposes; for, although it does not possess much strength, yet it makes good flooring boards; it is not liable to split on being nailed, nor does it readily take fire. Beech is very liable to decay, and from its propensity to warp is unfit for boards. Birch has no property to recommend its use in building. Alder is both subject to rot and to the attacks of insects. Plane tree and all the maple tribe are of very little value for building purposes. Larch, from its great durability and strength, is a most valuable wood for many purposes in building, for although, from its want of stiffness, it is unsuited to any purpose subject to a cross strain, yet for flooring boards, for door or window frames, and for doors and shutters it is unequalled by any other kind of wood. Of fir, any of the pine tribe of timber, grown in any part of Britain, is much inferior to that imported from Norway, Sweden, or Russia; and that grown in the Highlands of Scotland is superior to such as is grown in the southern parts of the kingdom. It may be remarked that whenever its use in buildings may be expedient, timber of British growth (except the best qualities of oak, Spanish chestnut, or larch) should always be of much greater scantling than is necessary for the best redwood from Norway.

REDISCOVERED FRESCOES AT AMSTERDAM.

THE lovers of art have been long puzzled to account for the disappearance of several frescoes and other decorative paintings described by Jacob Vos in his account of the Museum at Amsterdam. They were not to be found any longer, and there was no record of their fate. Some years ago M. Greeve, the curator of the Academy of Sciences, discovered a fresco on a ceiling in the museum which had been painted over. This fresco was by Niklaas Held Stokade, according to Vos. He has again lately, in the hall in which Rembrandt's *Night Watch* is placed, discovered a series of frescoes, which seem to be nearly as old as the building. They were all covered over with a thick paper, which had been painted and grained to imitate walnut wood. It is conjectured that this was done about the time of the French invasion, ninety years ago, to protect the pictures from appropriation by the French generals. On the whole they are in a fair state of preservation.

NOTES AND COMMENTS.

THE demolition of M. FALGUIÈRE's group on the top of the triumphal arch in the Champs Elysées is in progress. As the plaster figures had a height of nearly sixty feet and a length of more than eighty feet, the work is not easy, and it is calculated to occupy about three weeks. Great precautions have been taken to preserve the masonry of the upper part of the structure by covering the parts exposed to danger with timber, and to insure that in the descent of the various fragments the sculpture on the faces of the arch will not even be touched. Constant supervision is exercised both on the summit and on the ground.

THE opportunity for placing sculpture on Blackfriars Bridge is lost for the present. The *fiasco* is in a great measure owing to the action of the committee who had charge of the project. In the first place, by selecting four Mediæval kings for subjects the support of many councillors must have been lost, for City men know well under what circumstances charters were granted in those days. Then, again, Mr. BROCK, who has modelled admirable equestrian figures, was left out of the competition, although his sketch-model of EDWARD III. was at one time recommended for adoption. The reason given was, that it was supposed he would not do the work as satisfactorily as the artists selected. Although the bridge is only about fifteen years old, nobody seems to know whether the four masses of masonry were intended to serve as pedestals. It would be an advantage to crown them with sculpture, but what is needed is something which may give pleasure to the crowds that pass every day over the bridge. Happily the days are gone when people can admire monarchs whose lives were spent in seeking to obtain possession of various parts of the world without any honest claim to them.

THE Master of the Rolls has given a decision in the case of CRAWFORD and Others *v.* NEWTON which may suggest the difference between tenantable and decorative repair. Landlords are not easily convinced that, under the ordinary conditions of a tenancy, a tenant is not bound to leave a house in a condition that will require no outlay for papering or painting. In a five years' lease, which expired in 1872, a tenant undertook to keep the inside of the buildings in tenantable repair, and so to deliver them up at the end of the term. He continued as a yearly tenant in 1884, and on giving up the house he was sued for damages, partly because he had not painted or papered the house. Mr. Justice CAVE decided, like other judges before him, that a tenant was not bound to paper or paint, or to put a house in decorative repair, but allowed 20*l.* damages for decayed woodwork, which in one place had been caused by a neglect to paint. The law is clear in regard to damage of that kind. The owners were dissatisfied and appealed. The Master of the Rolls declined to define "tenantable repair," but Lord ESHER and the other Lords Justices were certain that, at least, it did not comprise painting, which was not wanted for the preservation of the building but for ornamentation, and papering, which was mere ornamentation. There is nothing new in the judgment, but in spite of it and many more to the same effect, we may be sure that litigation on the subject will continue as long as there are landlords and tenants.

SOME sanitarians believe that there is an advantage in the emission of disagreeable odours from sewers in streets. The occupants of neighbouring houses rarely agree in that opinion, and probably Sir ROBERT RAWLINSON himself would be tempted to be less confident about the virtues of openings from sewers if one existed in front of his hall door. If the sanitarians are right, Vulcan Cottages, Victoria Park, must have been in a blissful condition for many months, since along front and back there are drains which give unquestionable proof of their action by the escape of sewer-gas. It is not everybody who is an admirer of odours of that kind, and in consequence tenants cannot be found for many of the houses. The owner brought an action to restrain the Poplar Board of Works from permitting offensive and pestilential smells to issue from the two drains. One is a 9-inch glazed pipe drain, and was laid by the owner of the cottages for the time being; the second is a 12-inch, that was laid by the Board. When the case came before Mr. Justice NORTH the Board argued that they were not responsible for the 9-inch drain, as it was not a sewer in the sense required by the Metropolis Local Management Act, but the learned judge did not adopt that interpretation, and decided against the Board, granting an interlocutory injunction. The Poplar Board appealed, for a judgment to that effect entails a costly liability on local authorities, and as two out of three Lords Justices agree that the injunction was wrong and must be discharged, so far the victory lies with the Board. Everything turned on the difference in meaning between a drain and a sewer. According to the Act "drain" is to be taken as meaning "any drain of and used for the drainage of *one building only*, or premises within the same curtilage." Now a prior clause gives a district Board in certain cases power to substitute a combined operation for several separate drains. The question, therefore, to be determined was whether there was any clashing between the clauses. Nearly a month was taken to consider the question, and two of the Lords Justices believe that a combination of drains is still a drain, and, therefore, out of the responsibility of a district Board. As regards the larger drain or sewer belonging to the Board a decision could not be given, for evidence was necessary which was not before the Board.

IT is announced that the Receiver for the Metropolitan Police District has purchased the site on the Embankment known as the Opera House site, for the erection of new Central Police Offices. The building which Mr. MAPLESON projected, and on which a good deal of money was expended, would be more appropriate on the Embankment, but the days are over for operas which are conducted on the "star" system. It is to be hoped, however, that the style of the new building will make some amends for its purpose.

THE half-yearly meeting of the National Association of Master Builders of Great Britain was held on the 27th ult. at the Red Lion Hotel, Cambridge, and was attended by representatives from London, Liverpool, Birmingham, Bristol, Hull, Bradford, Bolton, Lancaster, Northampton, Wigan, St. Helens, Cambridge, and Lincoln. The meeting was presided over by Mr. W. H. COWLIN, of Bristol, the president of the association, who reported to the meeting the evidence given before the Select Committee of the House of Commons upon the working of the Employers' Liability Bill, 1880, and the proposed amendments, and also upon other matters of legislation affecting the building trade. It was decided to hold the next half-yearly meeting at Nottingham.

THE Consul-General for Belgium reports that he has reason to believe that England's participation in the Fine Arts Exhibition at Antwerp last year gave great satisfaction, English works of art being, as a rule, so seldom exhibited abroad. The British section contained 116 specimens, consisting of oil paintings, water-colour drawings, sculpture, engravings, and etchings.

PEOPLE who may be disposed to admire the carpets in the Indian section of the exhibition at South Kensington should bear in mind that much of it represents prison labour, and it is not complimentary to the colonists to find their products placed in juxtaposition with those of convicts. Mr. VINCENT ROBINSON, in a paper which he read at a conference a few days ago, pointed out that the carpets in the exhibition had no claim to be considered as reproductions of the fine old originals. The gaol authorities have nearly ruined the carpet-weavers' craft, and it appears it is now allowable for them to destroy other art industries with a like impunity. Mr. PURDON CLARKE, who has charge of the Indian department of the museum, acknowledged that the deterioration of Indian art was entirely due to the prisons. It is known that analine dyes are largely used in carpets, which, in consequence, cannot long endure. Would-be connoisseurs, who turn away from the products of English looms, will do well to consider what they purchase and whom they patronise when they buy Indian goods.

NO. 15. CENTRAL BLOCK OF DESIGN FOR A PUBLIC BUILDING.

NOTE.—"Youlgrave," which was published last week, is by Mr. R. Norman Shaw, R.A.

THE BRITISH ARCHÆOLOGICAL ASSOCIATION.

THE members of the British Association have had the advantage this year of exploring a large district in the north of England.

On Wednesday in last week the visits began with one to Piercebridge. The site of a Roman camp is now the village green, but as yet the place has not been adequately explored. At Gainford the church was seen. There were remains showing that a church had existed in Saxon times, and Mr. Brock stated that almost every church in the county had evidences of being preceded by one in Saxon times. Staindrop Church was also found interesting. It contains some early Norman work, a church being erected in that era without aisles, which was extended in its present form in the early part of the thirteenth century. Adjoining the chancel is the vestry, which was originally a priest's house, built by Joanna Swainford, daughter of John o'Gaunt. In the church are the Neville monuments, being effigies in alabaster of the first Earl of Westmoreland and his wife, Joanna Swainford. He died in 1326.

Raby Castle, belonging to the Duke of Cleveland, is near, and the members were entertained at luncheon in the great hall. The cellars date from about A.D. 1450. The kitchen resembles one in Durham Castle, but is larger. The Rev. Mr. Hodgson said the first mention of Raby was in connection with Canute. The original house had disappeared, the present one being built on the same site. Raby was unique and interesting as a castle. It was built by one man, the son of Neville, the victor of Neville's Cross. In almost all other cases it was found that there was a Norman core round which the buildings had grown, but Raby was the conception of a single mind. It was pitiful to think that this castle, which had been built by John, Lord Neville, remained practically intact till the end of the last century. It was then that the alterations had been made, the roof of the barons' hall having been altered and the room made 30 feet longer. He pointed out the remains of the old minstrel gallery at the end of the barons' hall. The relics and paintings of the barons' hall and the castle were inspected, many of which were of great historical interest.

The ruins of Barnard Castle were afterwards visited. Eggleston Abbey was described by Mr. J. P. Pritchett, and Sir J. Picton pointed out the mullioned eastern window as being unique in form. The day's work was finished with a visit to Rokeby.

Thursday's work was restricted to the neighbourhood of Bishop Auckland. The parish church of St. Andrew was described in turn by Sir J. Picton, Mr. Loftus Brock, and Dr. Hooppell. According to Mr. Brock, nearly all the churches in the diocese bore evidence of erection at different periods. The arching was amongst the finest in the county; but it was difficult to reconcile the tower, which was Early English of a simple character, with the architecture of the nave. The diversity of the designs in the pillars was a peculiarity, but served to impart a pleasing effect without adding to the expense. The vaulting of the south porch was considered charming. A peculiarity of the churches in this diocese was the absence of tracery. There was literally no Saxon work in the county, because the Saxons were little seen in Northumbria. Some Saxon stonework, however, had been discovered during the recent restoration of the church, and some of it was the most delicate that had been seen on that side of the Humber. These stones were for the most part sepulchral, and seemed to indicate that numerous interments of people of a noble class took place. That county was singularly destitute of monastic establishments, particularly of the enclosed, or lock-and-key order. A feature in Durham was that they found a great number of collegiate buildings, of which the present edifice was one, and it looked as if the bishops of that diocese were farseeing men, and had seen that the more secluded houses were not good, collegiate buildings allowing those belonging to them to live more amongst their neighbours.

St. Helen's, Auckland, was described by Dr. Hooppell. It was entirely composed of Roman stones, worked by Roman hands and brought to that place from Vinovia, which at that time contained a large population. They saw before them, without question, the whole of the original outlines of the church. Altogether the church bore a very striking similarity to the very ancient ecclesiastical remains in Ireland, which competent authorities were agreed upon, contained the remains of the most ancient ecclesiastical buildings, but which, however, were very rapidly disappearing. The real character of the church was fortunately discovered about seven or eight years ago, when great interest was excited, and a paper upon the subject was read at the time at the association's meeting held at Great Yarmouth in 1879. The church, which had been gradually going into ruin, had 600*l.* or 700*l.* spent upon it, and the old parish church thus became restored. Mr. Roach Smith, in his remarks, said in the church they had not only Roman materials, but Roman influence. Even the windows were Roman, and the structure must have been as near the Roman period as was possible, and must have been erected under the direction of Roman architects. At Auckland Castle the party was entertained by the Bishop of Durham, president of the meeting.

An evening meeting was held at Darlington, when papers were read on "St. Wilfrid of Ripon," and "The Conyers of Sockburn Hall."

The weather interfered with the success of the excursions, although on each day a large party was in attendance. On Friday the fine church of Richmond was visited. Mr. Loftus Brock said that the history of the church was closely connected with that of the adjacent castle, but whether or not there was a church there before the erection of the castle was a moot question. The probability was that there was a church in the Saxon times. The tower on the outside was worth careful inspection. It was entirely different to anything he had yet seen in Durham. It was a good sample of an early Perpendicular tower, and since it had the Neville arms on one of the parapets, and on one of the buttresses the arms of FitzHugh, with the date 1399, the theory had been advanced that it had been built by him.

After seeing Trinity Church in the Market Place of the town the party proceeded to the castle, which was founded in A.D. 1071. According to Mr. Brock, the external wall of the castle was about 600 yards in length, the barrier being strengthened by lofty square towers, the habitations of the principal officers, and enclosing a triangular space of five acres. The northern and eastern sides of the castle were defended by a moat, the weaker part towards the town being protected by a keep or great tower—a noble specimen of Norman architecture with walls of extraordinary thickness, and built about seventy-five years after the foundation of the castle by Earl Conan. This is 99 feet high, and the lower storey, now used as a militia guard-room, is supported by a massive octagonal column in the centre, from which circular groined arches spring.

On returning to the town the old Grey Friars Tower was seen, being all that survives of the monastery erected by Fitz-Randolph in A.D. 1257. A drive brought the members to Eastry Abbey, founded in 1152 by Ronald, Constable of Richmond Castle, and dedicated to St. Agatha. It was a Præmonstratensian Priory, chiefly Early English and Early Decorated, and was occupied by "white canons," whose order was founded in France in 1120. The first group of buildings contains the remains of several fine apartments. A part near the Swale is at present in danger of collapsing.

At the evening meeting Dr. Eastwood read a paper on "The Roman Roads," in the course of which he said the Roman communications between the southern and northern parts of Britain were kept up by means of two great roads, one of which proceeded from Deva (Chester) to Manchester, Lanchester, through the lake district—the High Street—to Carlisle and into Scotland. The second, and greatest road in the country, was from Dover to London, York, the Tyne, into Scotland. This was called the Watling Street. There was also a third road, about which much less is known than about the two roads mentioned. This is considered to be the Rykenild or Ikenild Street. It came from St. David's to Gloucester, went through Staffordshire, Derbyshire, by Derby and Chesterfield, probably to York, where it would join the Watling Street. From York its course was to Thirsk and Thornton-le-Street, three miles north of Thirsk, and from thence its course may be fairly traced through Great Smeaton, Girsby, and Over Diesdale, in Yorkshire, to Pountey's Ford. From the ford the road goes on to Sadberge, Stainton-on-the-Street, thence to Sedgefield. For six miles further north the course is clear, when the road is lost. For thirty-six miles from Thirsk to this point the Roman road is used as a modern road, with the exception of a few places where its course is obliterated, or it has degenerated into a field road or a foot-path. North of this point, in the parish of Kelloe, the course of the road is very uncertain, and the probable termination was on the Tyne, at or near South Shields, opposite Tynemouth.

Mr. Hutchinson also read a paper on "The Palatinate of Durham."

On Saturday several buildings were seen. First came Croft Church, with a thirteenth-century chancel and fourteenth-century nave. Croft Bridge was constructed in the fourteenth century. Hurworth Church was next visited, and was described by Mr. Pritchett. After the interesting church at Sockburn, the hall was visited. It was formerly the seat of the Conyers. The falchion, with which the "worm" or serpent was said to be slain, was exhibited. It was in perfect condition, possessing a copper handle, and having a coat of arms of three lions by the side of the pommel and an eagle displayed on the other side. The first representation was the early arms of the kings of England, and the latter those assigned to Earl Morcar. The date of the workmanship is about the middle of the thirteenth century. A stone effigy of the date 1290 called forth the remark that when legs were crossed in effigies, it was intended as an expression of repose, and not as a sign of a visit to the Holy Land.

At Dimsdale House some interesting objects were shown, which were found in the neighbouring excavations.

Mr. Loftus Brock read a paper at the evening meeting on "The Peculiarities of the Churches of the County of Durham." The churches of Durham were not, he said, so elaborate as those of some other districts, yet it would be found that they were of great interest. They were for the most part plain buildings, rather square and heavy in their proportions, and when they were large in size the same features were observable. Speaking generally, the churches of Durham would be found to consist of more regular planned structures than in some other parts of England. A local peculiarity was the existence of woodwork of great beauty in many of the buildings which had come under review. It would be found that close to the church in numerous cases there still remained the old residence of the earl of the manor, or such a building had existed. Were this found in only a few instances no safe deduction could be drawn from it. Being, however, so usual, it was of value as a disproof of the assertions so common in the present day, but which are so untrue, that each local church was erected by the State, and that it was therefore State property. Their position in respect to the manor-houses was alone sufficient to show that at some period in remote times the owner of the land erected a church for the benefit of his tenantry and his family. This was usual throughout the whole length and breadth of the land. In Durham, in addition, they found very ample evidence in the page of history that at early periods the owners of the soil were in possession of their own churches which they or their predecessors had built. They found them effecting repairs and also exercising all the rights of ownership.

Monday was the last day of the meeting, and the Wensleydale district was selected for the excursion. Middleham Castle was the first place of stoppage. Mr. Pritchett said it was one of the most famous historic buildings in this country. There has been practically a castle within a castle. The inner building is of Norman architecture, and is said to have been founded by Robert FitzRalph about 1119. The outer building is the creation of Robert Neville, the first Earl of Westmoreland, and dates back to the fourteenth century. It was at Middleham Castle that the Earl of Warwick, "the king maker," resided. The Duke of Gloucester, afterwards Richard III., also resided here, and it is the birthplace of his only son, an event which took place in 1473. During this period the castle was practically the centre of government for the country, and was the scene of some of the most thrilling episodes in the history of that period. The castle is now in ruins, it having been rendered untenable during the Cromwellian period. Notwithstanding this, however, the grandeur of the building may still be seen in the remains which yet stand commemorative of a bygone and glorious past. The parish church dates from the fourteenth century. Visits to Wensley Church and Bolton Castle, filled up the remainder of the day, and completed an agreeable meeting.

DURHAM CATHEDRAL.

THE members of the British Archæological Association, and other persons to the number of about two hundred, visited Durham Cathedral on Tuesday in last week. Before the building was examined the party attended the morning service.

The Dean of Durham (Dr. Lake) afterwards addressed the visitors from the lectern. He said that the building in which they were present was by many people considered to be not only a noble example of Norman architecture but one of the noblest of churches. When it was proposed about ten years ago to carry out some alterations, one of the best informed of English architects wrote to him, saying, "Be careful what you do, for you have to deal with the noblest church in the world." As he had asked Mr. Fowler to guide them through the building he proposed to relate the history of the cathedral in the briefest manner. After many wanderings the body of St. Cuthbert was brought there about the year 995, and the cathedral was commenced by the bishop of that time. That building was made of wood, and in about 100 years time it gave place to the predecessor of the present magnificent building. The work had really been done by the Bishop William of Carilepho. About 1090 the choir and central tower was built by him, the work being completed within ten or fifteen years by his successor, Ralph Flambard, a favourite minister of William Rufus. Rufus, with the assistance of the chapter, built a great part of the nave. Then the building went on, in periods of about fifty years. About 1150 the next bishop but one built the chapter-house, the two great doors, and other points. The Galilee was afterwards built by Bishop Hugh de Pudsey. That was about 1200. Fifty years further the Nine Altars Chapel was built. This was considered one of the most beautiful pieces of work it was possible to find. Mr. Fowler would, when they visited that portion of the building, draw their attention to the extremely able way in which the Norman and later styles were harmonised. This work was continued by Prior Melsanby, and within the space of 150 years that magnificent cathedral had been erected. It had suffered from the terrible work done at the Reformation. At the end of the last century the cathedral chapter had cut in half the magnificent chapter-house, which was the finest chapter-house of the kind existing in England. The present chapter had done their humble part to restore some parts in which it was thought the cathedral was wanting in beauty, but he hoped without doing injury to it in any way. When he first came he remembered being struck by the majesty of the whole place, but also that there was something wanting in what they might strictly call the beauty of the cathedral. Under the auspices of Sir Gilbert Scott they had had it restored. The choir screen before them was one of the works; some people liked it, some did not, but the chapter had done all they could to preserve and increase the beauty of the cathedral.

Mr. Charles Hodgson Fowler, F.R.I.B.A., prior to conducting the visitors round the building, gave a sketch of the history of the cathedral. He related the legend which led to the body of St. Cuthbert being brought to Durham. The monks were conveying the body of the saint through the country, and when they reached Warden Law, a hill in the vicinity of Durham, it became immovable. They prayed that they might be shown where to take the body, and after two or three days it was revealed to them that they were to take it to "Dunholme." They did not know where Dunholme was till they heard a woman inquiring of another woman whether she had seen her cow. The second woman replied that she had seen it in Dunholme, and the monks bearing the body (which could now be moved) followed her till they reached Dunholme, or Durham, where they deposited it and built over it a wooden church. That erection was replaced by a stone building known as the White Church, built by Bishop Aldhun. The position of that church, which was a magnificent church for those days, was probably on the south side of the present building. Bishop Carilepho came there bringing the Benedictine monks from Wearmouth, and turned the church from a secular into a monastic or regular building. This bishop, after being exiled for three years, during which it was supposed he thought the matter well out and drew plans for a church, laid the foundation of the building on August 11, 1093. There was very little doubt but that the idea of the great building came from him. There were certain points about the building which were essentially English. The choir was commenced first. When Carilepho died in 1096 he had completed the choir, and possibly the vaulting, part of the tower, the lower part of the transepts and the first bay of the nave, the triforium of which was of a simpler nature than the triforium of the remainder. It had been discovered lately that during his life the walls of the church had been built up as far as the arcade which ran round the building. This was not known at the last visit of the association, for the walls were then covered with whitewash. The cathedral was of especial interest, because it was apparently the work of one mind. During the three years the see was vacant after Carilepho's death the monks continued the building. The work went on during the episcopate of Bishop Flambard, and the vaulting of the nave was completed by the monks during the time the see was vacant from 1128 to 1133. Bishop Pudsey built the Galilee Chapel. At first he commenced to build it at the east end, but it fell down, and he then erected it at the west end of the church. It was really for the use of the people and was meant for a parish church. They next came to the Nine Altars, which was the idea of Bishop Poore, and which was carried out by Prior Melsanby. The bishop's throne was a beautiful and elaborate specimen of work built by Bishop Hatfield. In the choir there was formerly the great Pascal candlestick, the candles in which reached up almost to the vault of the aisles. It was the most magnificent thing of the kind in England, if not in the world. The only thing to be compared with it was the candlestick in

Milan. On the right of this was a pelican lectern, from which the lessons were read, and on the left an eagle lectern, from which the gospels were read. The stalls were the work of Bishop Cosins, and were remarkably beautiful specimens of the work of the time. They had had one of the finest screens in the world, reaching up to the capitals of the piers of the nave. There was a similar screen on a smaller scale in the Abbey of St. Albans.

The company then, under the leadership of Mr. Fowler, proceeded to examine the cathedral. He explained that the reredos was made of Dorset stone, and brought from London to Durham, where it took two years to erect. Passing out of the choir the company entered the Chapel of the Nine Altars, in which is the tomb of St. Cuthbert. The slab covering the tomb was laid by the commissioners of Henry VIII. when the body was taken from the shrine and buried there. There have been statements made that the body had been removed by means of a tunnel made to the tomb. No one who had read carefully on the subject, said Mr. Fowler, could come to any other conclusion than that the body still remained at Durham. In 1827 Dr. Raine opened the tomb and found a body, from which was taken the remains of several vestments of exceeding beauty. The pavement round the tomb had been much worn, it was supposed by people who on great days were allowed to go on the raised place where the shrine was and look at the coffin, which was exposed in those days. In the Nine Altars Chapel there were formerly nine altars, three in the centre and three on each side. They were formerly divided by screens of wainscot work. Here was also hung the banner of the Scottish king taken at the battle of Neville's Cross. Leaving the Nine Altars, the party proceeded to the nave again, where Mr. Fowler drew attention to the lantern tower and its extreme beauty. Proceeding to the end of the cathedral, the blue pavement, beyond which females were formerly not allowed to pass, was examined, and then the font, which is of comparatively modern date, the original being in the church of Pittington. The tombs of the famous Neville family, the doors, and the former place of sanctuary, were also pointed out, after which the company entered the Galilee Chapel, the principal object of interest in which is the tomb of the Venerable Bede. Mr. Fowler pointed out that the chapel was built on the verge of the precipice which overhung the Wear, and was supported by strong buttresses.

In the library Canon Greenwell exhibited many of the treasures to the visitors. In speaking of the restorations about the place, he said that some were not restorations at all, and referred with praise to the example set by Mr. Hardwick, who declined to remove the old oaken roof and substitute a high pitched roof of deal. After luncheon the castle was visited, Mr. Hodgson Fowler again acting as guide.

NORTHERN ARCHITECTURAL ASSOCIATION

THE annual excursion of this association was held on Monday to Raby Castle. The members reached Winston Station about 11 A.M., where they were met by their president, Mr. G. G. Hoskins, F.R.I.B.A., and driven to Staindrop. Here an inspection was made of the ancient church, after which the members walked across the park to the castle, of which an inspection was made, Mr. W. Livesey, the Duke's architect, and a member of the association, acting as cicerone. At 3 30 the members dined at the Queen's Hotel, Staindrop, the chair being occupied by Mr. Hoskins, and the vice-chair by Mr. Shewbrooks, vice-president. The party then drove to Darlington and paid a visit to St. Cuthbert's Church, expressing their general approval of the two new painted windows.

HYTHE CHURCH.

THE newly-found doorway, which was mentioned in last week's *Architect*, lies to the north of the crypt facing the main entrance, and the mouldings and Purbeck marble shaft are almost as perfect as when they came from the mason's hands 650 years ago, showing that for many centuries they must have lain buried. The monastery, of which the church was in all probability the abbey church, lay but a few yards below, and one of its principal entrances and the dole window are still seen *in situ*. Mr. Pearson, R.A., who is just about to restore the chancel, speaks of it as "one of the most interesting with which he has ever been associated," and adds that "the improvement consequent on the restoration in the internal effect will be almost inconceivable." It has many striking features. The exquisitely proportioned Early English windows, rich with dog-tooth ornamentation, the clusters of Purbeck marble shafts, which stand out with singular boldness from the main architecture, the triforium, like that of Canterbury Cathedral, verging on the Transitional, distinguish the choir as one of unusual beauty.

MR. STREET'S PRINCIPLES OF RESTORATION.

A CORRESPONDENT has sent us the subjoined lecture delivered in 1861, and in his letter says:—"The best refutation of the attack which Mr. Thomas Drew, R.H.A., has made on the reputation of George Edmund Street as a restorer is, I think, to be found in the lecture delivered a quarter of a century ago, of which I enclose a report. It will be seen that Mr. Street was an advocate of the most reverential mode of restoration. There is another point on which I should like to say a word. Mr. Drew says that Mr. Street's design for the Edinburgh Cathedral was 'pronounced to be crude, unsatisfying, incomplete.' It would be interesting to discover who were the hypercritics in this case. Certainly Mr. Christian, the referee, was not among them, for he testified that the design was excellent in every particular, very simple in its general character, bold and vigorous in detail. Mr. Street recognised the stipulated conditions of cost in the fairest way; Sir Gilbert Scott did not in respect of the tower, and probably no one in Edinburgh would say the best design was selected. The late Edmund Sharpe might be taken as a pretty fair judge of a design for a Gothic church. I remember his saying to me that among all the designs he preferred Mr. Street's. His reason was that in it a purer English type was recognised than in any of the others. It was not set aside on account of 'mere novelties and quaintnesses,' as Mr. Drew alleges. May I recommend to Mr. Drew the perusal of a letter relative to Christ Church Cathedral, which appeared once in *The Architect*? It says, 'So admirable is the restoration of Christ Church Cathedral as a whole, and so evident at every hand the personal devotion of Mr. Street's mind to it, that no one here, I think, would be ungenerous enough to cavil at trivial deficiencies in details, or unreasonably expect provision against every unforeseen circumstance which may be developed in the years after a work has left an architect's hand.' It is dated from the chapter-house of the said cathedral, and is signed 'Thomas Drew, R.H.A., architect.' What a contrast it affords to the paper reprinted in *The Architect*!"

This subject is one on which it may be difficult to say anything absolutely new or original, and on which nevertheless it is of no little consequence that from time to time something should be said by those who feel the whole importance of the charge with which we are entrusted in the restoration of our ancient buildings. How is it possible to overstate their value? They illustrate almost every page of the history of our country, in letters which are legible and unmistakable to all who take the pains to read them; and yet the slightest mistake in the restoration of any one of them may go far to destroy all their interest and all their value. They connect the present with the past in the liveliest way we can imagine, yet a mistaken mode of restoration may end in leaving us nought of the old work or the old associations, but in their place a completely modern-looking building, with associations going no further than a tribe of modern workmen, a careless architect, and a committee of enthusiastic but ignorant restorers. So that, in truth, the restoration of ancient buildings may very easily—as it does only too often—mean their destruction.

Our first duty is to be as justly conservative as possible wherever we have to deal with anything old. Not conservative in the sense of putting up a new copy of an old work—such as is in progress at St. Mary Magdalene's, Taunton—but conservative in the much truer sense of keeping the old work in its old place, with its old tints, its old weather-stains and lichens, and even its old defects.

It is almost impossible to overrate the importance of this first and great condition of all tolerable restoration, and I confess that as I grow older and think more on the subject, I find myself even more and more impressed with its invariable truth. Some years ago, at one of the first architectural meetings I ever attended, I remember having heard a discussion on the restoration of churches, which was opened by one who, partly for the sake of argument, partly because there was a half-truth at least in his argument, maintained that the only true mode of restoration was the "destructive," as he called it; by which term he explained that he meant that we ought to decide for ourselves which is the best style for our purposes, to make some one style our own, and then ruthlessly to pull down everything that disagrees with it: so that the choir of Lincoln and the nave of Peterborough or Ely, not being in that perfect Middle-Pointed style in which alone he saw any perfection of design or completeness of purpose, were, I suppose, to be pulled down, until nothing should remain but old works of one date, and new works in imitation of them; or—to carry the argument to its legitimate end—so that everywhere old buildings should give way to the perfect style (whatever that may be) of the nineteenth century.

Absurd and extravagant as such a view is, there is nevertheless a vein of truth in it, for the argument was founded, no

doubt, upon a careful consideration of the mode of work adopted by our forefathers, and in exact imitation of their mode of thought and action. No one who has examined their work can forget how little they reverenced the work of their forefathers. We praise William of Wykeham for his grand nave at Winchester, but what should we say to the man in our own age who should propose to continue the style of the central octagon of Ely on into the nave, by paring, destroying, or casing the old columns, inserting pointed and moulded arches, and throwing the aisle and triforium into one by the destruction of the Norman vault between them? Yet this is precisely what Wykeham did at Winchester; whilst his predecessor, Edington, no doubt pulled down a grand Norman west front in order to substitute his own conception in its place. And the instance I have given is one of all but universal application. Every man in the Middle Ages seems to have thought his own work better than that of his predecessor; and the instances are rare in the extreme where, as in the naves of Westminster Abbey and Worcester Cathedral, the architect has distinctly copied the work of the earlier architect of the choir. And unquestionably, great part of the admiration we feel for this old work is intimately dependent upon that hardihood and self-confidence which ever characterised its designers; for it needs not to be said that, if our old architects had reverenced their fathers' works as much as we respect theirs, we should have had, perhaps, more buildings of uniform character, but they would have shown far less originality and life and vigour than they now do. The reason, however, for this contempt for their predecessors' work is very plain, when we consider how comparatively short the interval was which separated the latest of our Mediæval architects from the earliest, and how completely it had been bridged over by the very gradual nature of the development in their style.

The destructive system of restoration which was the rule in the Middle Ages, however defensible and right it may be in theory, is entirely indefensible and wrong in practice. For let us once allow it to be right in practice, and we shall soon find men on all sides with little reverence for what has gone before, and much conceit in their own cleverness, ruining in a short space of time that which no space of time whatever can give back to us.

There are three modes of destructive restoration, and each equally effectual. The first, that which would pull down and reconstruct in a new style; the second, that which would pull down and re-erect in the same style; and the third, that which would tool and scrape every stone in a wall until the whole should appear to be new. Of these systems the largest and boldest examples are, fortunately for us, to be seen on the Continent, and we have suffered comparatively little as yet.

How much is lost in the course of destructive restorations it is almost impossible to calculate. In some cases in England we have suffered terribly, and nowhere more than at Salisbury. The destruction of the old campanile, the confounding together of portions of monuments of various dates in the most indiscriminate fashion, the removal of screens, and the carting away of old stained glass to the city ditch, are among the architectural sins for which James Wyatt, "the destructive," as Pugin rightly called him, has to answer.

The restoration of the west front of Lichfield Cathedral between A.D. 1788 and 1795—one of the most abominable even of the works of that "ingenious architect Mr. James Wyatt," as Storer called him—and the restoration of St. Denis, in France, are cases of even more grievous spoliation than that of Salisbury; and we cannot, I think, be too thankful that an age in which all restoration would necessarily have been destructive in the extreme, was at the same time an age of such apathy and lethargy that it was the rarest thing for any restoration or repair of an old building to be undertaken at all.

That third kind of destructive restoration to which I referred is, unfortunately, so popular with some people that, if we do not take care, great damage will be done, not always to the architectural design, but (which is just as important) to the colour, tone, and interest of our old buildings. And in reference to this I am unable to avoid mention of two restorations now or lately in progress, both of which seem to me to be of an unfortunate description. They are those of the western fronts of Lincoln and of Winchester.

The former is, I am told, being retooled and repaired wherever defective, so as to make it look like a new work of our own day. And the history of the whole thing is worth telling. It seems that a former clerk of the works is supposed to have had some interest in the use of a Yorkshire stone in place of the native stone in repairing the west front. The Yorkshire stone he used has decayed rapidly, and all his work now requires renewing with the same stone that was used in the old work; but, not content with repairing defects, they are carrying the cleaning, tooling, scraping process over the whole of the work, so as to make it look uniform.

I wish men would consider a little what this cleaning process involves. Directly you set a mason to clean a piece of old work he proceeds to chisel away something like an eighth of an inch of the surface everywhere. All mouldings assume, of course, new proportions: the hollows become larger, the bowtells smaller, and each cleaning is therefore one step in the destruction of the work; whilst it happens continually that an ignorant workman will in an hour or two destroy the special features of an old moulding, without having the slightest idea that he has altered the section at all. It ought to be understood, therefore, that in all cases of cleaning and refacing old carved or moulded work no amount of skill on the part of the architect (who cannot always be on the spot) can secure the work from irreparable injury; and I hardly know what guarantee we can have that at Lincoln the damage to old colour and the alteration of the relative proportions of mouldings are the only things we shall have to lament in this mistaken work of so-called "restoration."

At Winchester a most inexplicable work of the same kind is in progress. Here the main beauty of the old work was its colour. It never was a very grand façade, and had many of the usual faults without the best features of Perpendicular design; but time had done its work, and the west front was in colour and general effect fairly in harmony with the rest of the building, and a work for Englishmen to be proud of. Now, as you go along the railway to Southampton, you see the new tower and spire of a church, and beyond it what seem to be the equally new gable and pinnacles to the cathedral; and I hear that they propose to polish up the whole west front in the same way, to match the gable. Then, if funds last, I don't see why they should not undertake the side walls, and finish up with a refresher over the whole surface of the fine Romanesque central steeple! When all this is happily consummated, the good people of Winchester will, I suppose, be happy, and their grandchildren may hope to see the cathedral again in its old colour and with its old effect. I cannot imagine that the stonework required scraping; for not only is the stone at Winchester generally in very fair condition, but at the same time I have but little doubt that the putting a new face on it will render its future decay more probable and rapid than any other course that could have been adopted. The castle and much of the exterior of the cathedral at Norwich are also examples of destructive restoration; and here the walls have been so plastered with cement, coloured to imitate the stone in the most elaborate way, that I fear most of the original work is absolutely destroyed.

Destructive restoration is accomplished also by the removal of furniture or fittings of old buildings as often as by the alteration of old detail. For instance, there used some years since to be a number of very fine carved oak stall or desk ends, of the fourteenth century, in the choir of Wells Cathedral; their places are now occupied by new work and designs, and on a recent visit I could find no trace whatever of any of the old ends, whilst the verger absolutely refused to allow that there ever had been any such work as I described in the cathedral. Similarly, I remember seeing the fine wooden gates of the screen at Dorchester in a builder's yard at Oxford, copies of them having been erected in their place, to save the trouble of restoring the old gates, and probably without the knowledge of the architect. So, too, some one once sent as a present to the Oxford Architectural Society a fine seat-end, which I recognised as having been taken from a church in Staffordshire, probably during some repairs; and in these cases we architects are by no means always in fault, for there are some clerical and other restorers who take strong fancies and strong dislikes. One man cannot tolerate his old chancel screen—another does not like poppy-heads; and each of them banishes his enemy when he has him in his power during the work of restoration! And then there are, or at any rate there have been, some antiquaries who seem to think it no theft to pocket a curiosity, and have no compunction about giving the last wrench at an old brass. So of late years the grand St. Maur brass at Higham Ferrers has suffered, and at the present moment, the church having been shut up unused for a couple of years, one of the older brasses is all but pulled off the stone, and will probably, unless more care than hitherto be taken, have disappeared altogether before the restoration is complete.

I was told the other day of a curious example of the effect of careless or ignorant restoration on the south doorway of the north wall of the choir of Lincoln Minster. The central shaft was of later date than the jambs, and the latter, having become decayed, have now been restored in imitation of the central shaft. The result of course is unfortunate in every way, and the story which the old doorway told has now a third chapter added, which makes the whole unintelligible.

So far all the examples of destructive restoration have been such as all will agree in condemning. There are other examples as to which we may well be more cautious in the expression of an opinion; because, though they are among the really destructive works, they are also among the best, the most careful, and the most sumptuous of restorations. Take the most remarkable example—the chapter-house at Salisbury. Here we see the whole interior restored with new polished marble shafts; new stonework wherever the old was damaged in any way; walls

and roof covered with new painting; and finally, the whole of the sculptures from Old Testament story which fill the spandrels of the arcades restored, repaired, and renewed in the most elaborate manner, and then covered with painting. Now, independently of the question whether the chapter-house be or be not now exactly in the state in which it was left in the fifteenth century (and, as far as the colouring is concerned, I doubt it vehemently), such an elaborate restoration is very dangerous.

I believe it to be quite impossible, and very wrong, ever to attempt the restoration of sculpture. If you have a piece of old sculpture so damaged as to interfere seriously with the purpose of the portion of the building in which it occurs, the right thing to do is to move it bodily to some other place, and there carefully preserve it; whilst in its place you insert an entirely new and original work. You have no more moral right to touch up or patch the work on which an ancient sculptor bestowed his art than you have to touch up, finish, and repaint the work of a Giotto or a Fra Angelico. They are all works of individual artists, and because their names happen to be unknown we are not relieved from the duty of preserving them exactly as they have been handed down to us.

In the chapter-house at Salisbury no absolute necessity for the restoration of the sculpture existed. The old sculpture, damaged as it was, gave us nevertheless the exact measure of the artist's power, had all the interest which the certainty of antiquity imparts, and presented to us in every part the sculpture of the fifteenth century. Now it is difficult to know what to trust. The work has been done with singular care; yet I am confident that it must be impossible to repair and patch any old work without at the same time running great risk of having the old work chiselled, filed, and fitted to the new; whilst the final operation of painting has effectually concealed much of the delicacy of the sculptor's work. Suppose, for an instant, the same system adopted elsewhere, and our royal tombs at Westminster, our unsurpassed sculpture at Wells, our sculptures round the chapel at Ely, and elsewhere, all carefully and painfully repaired, restored, scraped, and repainted, and I think you will be affrighted at the idea. The truth is that most of us at the present day had better, when we want to show our knowledge of sculpture, do so in our new work, and when we wish for colour, paint also our new works, and not our old.

The question of the application of colour upon architectural work is not to be settled in a sentence; but, fond as I am of colour in its right place, I should generally dread very much to hear of its being applied to any old building for which I had much affection. Would any of us tolerate the idea of Westminster Abbey being given up to the colourist? I think not; for though the proportions, the mouldings, the traceries would remain all as they were before, the marks of age, all that makes the church venerable or connects it to the eye with the associations of the past, would have disappeared at once; and we ought never to forget that in all restorations this evidence of antiquity is the one thing which, above all others, must never be destroyed on any account, and just as in all destructive restorations no account whatever is taken of it, so in all restorations well carried out this is the one thing which, above all others, is most taken into account.

The first mode of restoration is fairly called Destructive; the second and safer mode is rightly called the Conservative: and I will now endeavour to show how this mode may without difficulty be generally carried out.

The mason must be attentively watched in his mode of doing his work; he should (if the old work be good) attempt, as far as possible, to assimilate his own to it in every way—in the bond of the masonry, in the mode of dressing or working the stones, and in the general character of the work. He should be allowed to indulge in no such ingenious devices for spoiling masonry as black mortar or ruled joints; and whether the work be new or restored he should be compelled to do it at least as solidly and substantially in all respects as the old work.

Where old buildings are so decayed as to be capable of repair only by propping or by rebuilding, the former is generally the better of the two plans, as still leaving most of the old work intact. When rebuilding is decided upon, if the stone is not decayed, and the work very good in its character, every stone of the old work should be marked as it comes down, and should be re-erected in its old place, and with as little disturbance as possible to the old work. This is the true conservative course; but I am not sure that any good example can be given for the course (so often taken now) of rebuilding entirely new work in imitation of old work which has been completely destroyed. At Doncaster, for instance, after the fire it was made a great point that the steeple (I am not sure about the church) should be accurately restored in the new building. The architect's hands were tied by the condition, and he has given us a steeple and a church which are evidently compromises. They are not really a copy of the old work, and yet would probably have been still better than they are if they had not pretended at all to be a copy. At St. Mary Magdalene's, Taunton, the tower is being rebuilt in exact conformity with the old work, and an enormous amount of architectural superintendence given to that which is after all only the proper work of an ordinarily intelligent clerk of the works. Finally, at Chichester, the central steeple is a ruin, and the people of Sussex have come forward nobly with a large part of the funds required for rebuilding it. But the first condition one hears is that the steeple is to be rebuilt as of old; and one asks with some astonishment whether it can really be purposed to erect a copy of the late spire upon the copy of the early tower! Surely it would be tenfold better, if copying there must be, to confine it to the tower, and to make the whole steeple uniform in its style. There ought to be no difficulty about making a spire at least as good in its outline as the old spire; and the rebuilding of an exact copy of it, with nothing but new materials, would not to my mind be a restoration at all. Nevertheless, the spirit which prompts this desire for exact facsimiles of old work is one full of good, and marks that intense love for our old buildings and old customs which still I hope marks the people of England above all others at the present day.

In matters of detail, conservative restoration is often possible when it is not practised. In stained glass, for instance, Mr. Ward some time ago gave an example of the best mode of restoration, in an old window of a church in Berkshire which I was restoring. A good deal of the glass had been destroyed; the leading still in the main remained, and he re-leaded the whole of the glass, filling in the vacant places with plain glass, opaquely painted; and the result was that, at a small expense, we had the old work, and nothing more, permanently preserved, with nothing conjectural, and with an effect which, I confess, I could scarcely have anticipated. This work was done under Mr. Winston's supervision.

There are many other points on which a restorer should take special pains to conform to the old example. Wherever old levels of floors can be discovered, they should be most carefully copied. Old levels are generally well arranged, and not unfrequently with great peculiarities. As, for instance, the laying a floor on a gradual slope up from west to east. Then, again, the local fashion as to seats, &c., in churches is generally preferable to any other, especially where any example exists in the building under restoration which is at all worth repetition.

Painting on walls should, generally speaking, be carefully cleaned, and, where it consists of figures and subjects, should not be restored. If the work be rude, it can hardly be restored in a rude fashion without being absurd; if its character be good, then it is, as I have said elsewhere in reference to sculpture, a pity to touch it, lest we destroy any of the characteristic touches and fire of the old artist. I have the authority of Mr. Layard—than whom no one has more zealously exerted himself in the cause of early Italian art—for saying that the greater portion of the damage which is done to the old Italian frescoes is inflicted by their restorers, who recklessly paint and repair every damaged work for which they can induce anyone to pay. And the fact is the more startling when we consider that the existing government of Italy is engaged in putting down the religious orders, turning them out of their houses, and converting the convents and churches—which contain the most glorious works of art in the world—into stables, barracks, and schools; so that the restorers must be actively vicious indeed who outdo such a government in destructiveness!

There is one common reproach in the mouths of those who have no feeling for our national antiquities, to which a few words of answer are necessary. They assert that all this work of restoration is unreal and untrue, inasmuch as both our religious life and our civil life are quite unlike what they were: they say that the old buildings of each class are consequently quite unfitted for our use on religious and on utilitarian grounds. In short, Lord Palmerston's "Civis Romanus sum" is interpreted literally by them, as it is by his lordship, to mean that Roman architecture is the only art fit for English citizens, and that we ought no longer to put up with any revival of English art. The charge is ingenious, but untrue. Take our churches—and in what respect is it necessary to alter them materially for modern use? As far as the Church is herself concerned, I may safely answer, hardly in any single respect need they be altered; for whilst Ely and Sherborne and a host of smaller restored churches show the perfect liberty which she enjoys and allows in their restoration on the most gorgeous scale, we hear now, week after week, of gatherings in our cathedral naves—either in Westminster or Exeter to hear sermons, or at Ely and Peterborough to join in choral practice—so large that even their spacious areas are not ample enough to hold the crowds that throng through their doors. And is it possible that this English nation, which prides itself so much upon its practical character, should be so unpractical as to go on, year after year, ever more and more actively at work, restoring and refitting old churches, if those old churches are not the most convenient and the most suitable buildings that could be devised for their sacred purposes?

No work perhaps affords better training for an architect than the study which is involved in the attempt to become a thoroughly good restorer of ancient buildings. He cannot do

his work even passably well without a hearty love and reverence for them; this love and reverence cannot be mere abstracting, but must be followed up by active work, active study, sketching, measuring, making notes, and thinking well upon and among them. This can never be done so well at any time as at first; and yet I grieve to say that a large majority of young architects go on year after year without apparently even so much as thinking of the necessity of studying old buildings for themselves, or taking the slightest active interest in any work beyond that which is put before them in their office. Now what must be the fate of buildings restored by a class such as this? Is it possible that they can be well, scientifically, or in any respect properly done? Obviously not. Yet—I am within the facts in what I say—I have over and over again had applications from assistants in want of employment, and it is a painful fact that a very large majority of them have never studied or sketched any old building; or if they have done so, have done it once or twice only in their lives, in a way so disgracefully careless as to make the hair stand on one's head at the idea of its being called study at all. Yet every one of them would undertake to restore a church with as much *sang froid* as it has been said one of our statesmen would display in taking the command of the Channel fleet. We want also educated clerks of works and educated builders; and let me say, without any lack of respect for the class, that generally speaking it is much safer to entrust works of restoration to local builders in only a moderate way of business than to large contractors, who seldom themselves see the work which is being executed, and who do not find it worth their while to enter carefully into those minutiæ which every restorer of an old building is bound to attend to. Our educated architects must educate themselves, not in Continental examples or from Continental books, but from English examples and English books. Whatever may be the value of foreign study to the architect (and from some points of view it cannot be overrated), nothing is more certain than it will be of no help whatever in finding out the meaning or intention of ninety-nine out of every hundred of our old English churches and houses. They are thoroughly national, and all their peculiarities are national peculiarities. They have also provincial peculiarities, so that none can expect to understand them thoroughly without mastering all their provincial as well as their broader national peculiarities.

The Pugin Travelling Fund will, I hope, soon be in existence to encourage men in this branch of their studies; though, if the entire truth must be told, our art will not prosper while our students require a premium to induce them to study it. For myself, I should be ashamed of any young student of architecture who is content to waste his time and his holidays in indolent and selfish amusements, when he might, knapsack on back, be at work from day to day, for a month or two in every year at the least, walking from one spot to another of this glorious country, gathering as he goes the information which will enable him in time to distinguish himself in his art, while the act of obtaining it is as full of real pleasure as deer-stalking, climbing Alps, or any other athletic work.

This, then, is the sum of what I have to urge: that only after diligent study of our old buildings should we ever venture upon undertaking the charge of their restoration, and that the great end and object of all our restorations should be to preserve the old fabrics in all their old beauty of colour and design for our children's enjoyment. In our new works we have plenty of scope for the most ample originality, if we are capable of it. But we do not want to see Venetian Gothic windows introduced into our cathedrals or our castles, where they would be out of all harmony with everything that surrounds them, and standing evidences, not of our knowledge and our skill, but of our childish conceit and affectation of superiority to the men whose work we so obviously despise, though we pretend to restore it.

ROCHESTER CASTLE.

A PAPER on Rochester Castle was read by Mr. Stephen Aveling on the occasion of the visit to Rochester of the Kent Archæological Society. In the course of it he said:—The earliest history of the castle is bound up with that of the church of St. Andrew, which adjoins. Twelve hundred years ago the castle and the bishopric were under one rule, and doubtless the residence of the bishop was within the castle walls. Midway between London and Dover, on the great Roman road, and on an important river, it must always have been a stronghold of great value. There has been some little difference of opinion as to the age of Rochester Castle as it now stands, but I believe it is now generally admitted that the main portion—this wonderful keep—was built in the second quarter of the twelfth century, or say between 1126 and 1139, by William de Carbeuil, Archbishop of Canterbury. It has been called Gundulph's tower, and it may have been erected on the site of a tower erected by Gundulph, but it was not built until a quarter of a century after that great architect's death, when the custody of the castle, which formerly belonged to the See of Rochester, was transferred to that of Canterbury. It afterwards fell into the hands of the Crown, and in the early part of the thirteenth century reverted to Canterbury and again to the Crown. In 1215 it underwent a siege of three months, and its defenders played an important part in the history of our country. Having withstood the battering rams, catapults, and engines of war (the 80-ton guns of that day), it fell by the efforts of the miners. The breach probably occurred at the south-east angle, and accounts for the circular bastion tower in the curtain wall and the south-east circular angle tower of the keep. A large portion of the keep was destroyed. The very inferior work of the rebuilt portion is in strong contrast to the original. In the construction of the keep Kentish rag, ashlar and Caen stone was used. The mortar is very good, though imperfectly mixed, and contains a large quantity of uncrushed sea shells. The keep is 125 feet to the top of the turrets. It is a square, 70 feet at the base and tapering to 66 feet, and it is one of the loftiest in England. Lately, a sailor, for a bet of a pint of beer, climbed one of the turrets, and stood with outstretched arms on the uppermost stone. The walls are 12 feet at the base and 10 feet at the summit. There are several chambers in the walls of the keep. The basement was probably used only as a store-room. In the north wall is a bold arched doorway with chevron moulding, and within the outer face is a portcullis groove. The main or State floor has some very handsome work. The arcade of the divisional wall has been filled by a stone screen built between the piers of the wall, and not bonded into them, although original. The fireplaces are interesting, the tunnel-vent passing diagonally through the wall. The chapel, which is the uppermost floor of this building, is divided by an arch into nave and chancel, the former occupying two-thirds of the building. There is a door from the main floor of the keep into the nave of the chapel. In the opening is the groove for working the iron grating, which closes the door underneath. The chancel has a groined or semi-domed roof and stone floor, and there is an entrance to it on the south side from the staircase, in the usual position of the priest's door. There is also remaining the drain of the piscinæ, which probably suggested the mistaken idea that this had been a kitchen. I was for a long time undecided whether to attribute this chapel building to a later date than the keep or to the same period as the keep itself, and after thinking about it from the year 1860, I am inclined to conclude that it was not an addition, but part and parcel of the original building. The castle and outworks occupy about 4¼ acres. The gate-house stood at the north-east angle. In piercing the tower at the north-west angle for the new entrance, a portion of a perpendicular chamber or crypt was discovered. The earliest work appears to be in the western wall. Valuable papers have been written upon the castle by the Rev. Chas. Hartshorne and Mr. C. T. Clark.

THE INSTITUTION OF CIVIL ENGINEERS.

THE members of the association of the Birmingham students of this institution on Tuesday last visited the works of the Horseley Company, Tipton, when, amongst other ironwork, a bridge for the Buenos Ayres Railway, and 6 feet diameter wrought-iron pipes for the Sydney Waterworks, were inspected with much interest. After the visit a meeting was held, when Mr. E. Pritchard, M.Inst.C.E., was elected president, and Messrs. J. W. Gray, M.Inst.C.E., C. Hunt, M.Inst.C.E., and W. S. Till, M.Inst.C.E., were elected vice-presidents.

Bygones.

"*Antiquity after a time has the grace of novelty.*"—HAZLITT.

THE LONDON ARCHITECTURAL SOCIETY.

IN the paper on the history of the Institute which Mr. C. L. Eastlake read at the conference held in 1876, there is mention of the London Architectural Society that was founded in 1806. It was an early example of what is now called a Mutual Improvement Society. The founders proposed to improve one another, and to improve the science, for in those days architecture was considered to be a science rather than art. It will be seen from the rules which are given below that the end was proposed to be attained by means of—(1) essays; (2) designs; (3) discussions; and in the three kinds of work every member was expected to bear his part, or, if not, to pay a fine. The composition of essays was intended to "excite a spirit of inquiry and accurate observation, and to induce each author to make himself more fully master of the subject than he perhaps

otherwise ever would have been." The designs were meant to "develop invention, thinking, and the rejection of incongruous ornaments and useless members." The discussions were to "give to each member the advantages of the taste and experience of all the others."

The necessity of the society was suggested by the unsatisfactory condition of architecture at the time, which is thus described:—"In England, architecture has been considered rather as a trade than as a science. The public buildings in which it has had opportunity to display itself have been comparatively few; and it has perhaps been imagined that, in the usual practice of house-building, the accomplished architect has little advantage over the mechanical builder. Yet surely, in construction and in arrangement, superior science must afford some advantages, and it ought to be remembered that it is only by the union of taste and knowledge that economy can produce simplicity, or expense be well directed to attain magnificence."

Among all the institutions in London at the time there was not one that was calculated for the encouragement of architecture. The Royal Academy was no exception, for, according to the statement of the founders of the society, "the lectures have long ceased; and medals privately distributed, and the use of a library for a few hours one day in the week, at a time when it is hardly possible for a student in architecture to attend, and that interrupted by long vacations, cannot be deemed of much value."

According to the list which appeared in the volume representing the work of the society there were only twenty members. Joseph Woods, the author of "Letters of an Architect from France, Italy, and Greece," and other works, was the first president. James Elmes, also known as a writer, and James Savage, who afterwards designed St. Luke's, Chelsea, were the vice-presidents. Among the members were Samuel Beazley, who built many theatres in London and wrote a few plays; W. H. Ashpitel, the father of the late Arthur Ashpitel; J. Taylor, the publisher; George Smith, the architect of St. Paul's Schools, lately removed; Edmond Aikin, who was employed on Milbank Prison; and C. A. Busby, afterwards largely engaged in Brighton. The provinces were represented by Mr. Billing, of Reading.

The following were the rules adopted for the society, and in another number an account will be given of the essays:—

1. The society shall consist of a president, four vice-presidents, a treasurer, secretary, members in ordinary, and honorary members.

2. The president and treasurer may be elected from the members in general, but the vice-presidents and secretary shall be chosen from the ordinary members. The above officers to be annually elected by ballot, and to serve without fee or reward.

3. The ordinary members consist of those gentlemen who engage to produce designs and essays, according to rules 10 and 11, and to these shall the whole property of the society, as vested in the trustees, belong. The honorary members are not required to produce any such designs or essays, nor shall they be subjected to any fines for non-attendance at the meetings of the society.

4. All the members shall have an equal vote in every transaction of the society, and equal right to the present use of its property.

5. The subscription demanded from every member shall be two guineas annually, to be paid in advance at the last meeting of the preceding session.

6. No member shall have the right of voting, or the use of the society's property, who has neglected his subscription according to the preceding rule; and if any member shall neglect to pay his annual subscription for two years after it has become due, he shall be liable to ejection from the society.

7. The meetings of the society shall be held once a fortnight, on Friday evening, at half-past seven o'clock precisely, from the last Friday in October to the first Friday of meeting in May inclusive, at all which meetings the president, or one of the vice-presidents, or, in case of their absence, any member appointed by the gentlemen present, shall take the chair, regulate the business of the evening, and read the communications. The secretary also, or, he not being present, a member appointed in his place, shall read the minutes of the preceding meeting, and then note the members present. He shall afterwards present communications, and take minutes of the present meeting, with the fines incurred and received. Other business transacted at the society's meetings will be to discuss the designs, observations, and essays before it, in which all persons present may take a part.

8. Every ordinary member who shall be absent on two successive nights of meeting at the time of noting the members present, shall incur a fine of five shillings, and also five shillings for every additional night of absence, unless prevented by illness, or a distance of more than ten miles from the place of meeting.

9. Any day of meeting, or any other day during the session, may be appointed and declared as a special day for the consideration of extraordinary or important matter, upon a requisition signed by four members, and made to the president or one of the vice-presidents; and notice of such special meetings shall be sent by the secretary to each member; the requisition, during the interval, being placed in a conspicuous part of the society's room.

10. Every ordinary member shall produce annually, according to a rotation and time agreed on, an architectural design never before in any way made public, consisting of at least one plan, elevation, and section, and accompanied with observations critical and explanatory (without which no design can be accepted), under the forfeiture of two guineas.

11. Every ordinary member shall also produce annually, in the agreed order, an essay on some subject connected with civil architecture, or forfeit half a guinea.

12. The designs and essays delivered shall remain the property of the society, who shall publish annually a selection of such essays as a committee, appointed for that purpose, shall think deserving of public notice. The author of each essay inserted shall be presented with two copies of the volume, and every other member shall be entitled to purchase a set of the publication at prime cost. The same rule shall be observed if the society publish any selection of the designs.

13. All fines incurred shall be demanded by the secretary at the first opportunity, and any member neglecting or refusing to pay his fines on demand shall be subject to the first, and if he neglects or refuses to pay them during two years, to the second of the penalties mentioned in rule 6.

14. All the subscriptions, fines, and other receipts shall be paid to the treasurer, who shall keep accounts of the same, and make all the disbursements required for the use of the society. The treasurer shall attend at the last meeting of each session, and produce receipts for all sums above 2*l.*, together with his accounts, which shall on that day be finally adjusted and closed, the balance in hand (if any) carried forward to the account of the next session; and the current accounts being audited and passed, shall be signed by the president, secretary, and at least three members. The treasurer shall not pay any sum above 10*l.* without an order of the society signed by the president, or a vice-president, and three members.

15. The funds of the society shall be appropriated to defraying the necessary expenses of meeting, to the purchase of books, prints, articles of furniture, the publication of the essays, and to such other purposes as the society may judge proper.

16. A committee of the ordinary members shall be annually elected to direct the expenditure of the society.

17. On the last night of every session no design shall be exhibited or essay read, but the accounts of the year being closed, the society shall proceed to elect all the officers for the succeeding session. The elections to be performed by ballot, each member delivering his list, folded up, to the president, vice-president, or such other person as may be in the chair, who shall appoint three scrutineers to examine the list and declare the officers elected.

18. Every candidate for admission into the society shall be proposed and recommended by two members, who shall deliver to the secretary a paper specifying the name, place of abode, and addition of the person recommended. This paper being read, shall be suspended in the society's room, and at the second meeting after that at which the proposal is made the candidate shall be balloted for; and if three-fourths of the members voting ballot in his favour, he shall be deemed a member of the society upon payment of the subscription, together with whatever entrance-money it may be thought proper at some future period of the society to demand, and subscribing the book of rules and orders.

19. Any member may be expelled from the society, sufficient cause having been assigned, and a motion for that purpose made and seconded, which shall be entered on the minutes, a notice of it suspended in the society's room, and a copy sent to the objectionable member. The motion shall be again proposed at the second meeting afterwards, and then put to the vote; and if three-fourths of the members present and voting determine in favour of the motion, it shall be carried in the affirmative, and the person who is the object of it shall cease to be a member of the society.

20. Any member shall be at liberty to withdraw from the society, upon signifying his intention in writing to the secretary.

21. No proposition shall be made for altering or repealing any rule or order of the society until the same shall have been in force at least three months.

22. No new rule shall be made, nor shall any old one be altered or repealed, without the concurrence of two-thirds of the members present and voting at a meeting subsequent to that at which such new rule, alteration, or repeal was proposed; and such new rule, alteration, or repeal must be confirmed at a future meeting by a majority likewise consisting of at least two-thirds. After such confirmation it shall be considered as a rule and order of the society.

23. Any proposition for the above purposes, after having been rejected, shall not be renewed until the expiration of three months from the time of such rejection.

24. In all dubious cases the person in the chair shall have a casting vote.

25. Every member shall be allowed to introduce one stranger to any meeting of the society, except the last in each session and all special meetings, on giving his name to the secretary.

26. Any member losing or injuring any of the society's property shall be bound to make good the damage.

27. The whole of the society's property and effects, of what kind soever, shall be vested in four trustees; and whenever their number shall be reduced, an extraordinary general meeting shall be held for the purpose of filling it up.

CHURCH BUILDING AND RESTORATION.

Beverley.—The foundation-stone of a Congregational chapel has been laid. The building is to accommodate about 500 people. The design is Decorated Gothic, and the material will be red brick with Ancaster stone dressings. Mr. B. Thompson, of Hull, is the architect, and Mr. R. Potts, of Beverley, the builder.

Burton-on-Trent.—The memorial-stone of a Baptist chapel has been laid. The plans for the new edifice were prepared by Mr. A. T. Greening, architect, of Birmingham, and the contract to execute the work was taken by Mr. H. C. Mellors, of the Borough Road, Burton-on-Trent, the price being about 1,800*l.* The building will be of brick with Bath stone dressings.

Clumber.—The foundation-stone has been laid of a new church near to Clumber House, on the estate of the Duke of Newcastle. Messrs. G. F. Bodley and T. Garner are the architects. The style of the new church will be fourteenth-century Gothic, strictly English in character.

Greystones.—The foundation-stone for the extension of St. Kilian's Church has been laid by Dr. Walsh, the Catholic Archbishop of Dublin. The new building is an extension of a small Gothic edifice built many years ago on the same site, and which at present affords accommodation for not more than 300 persons. Mr. P. F. Comber, of Dublin, is the architect.

New Brinsley.—The memorial-stones of a new Primitive Methodist chapel at Brinsley, near Alfreton, have been laid. The architect is Mr. G. Eyre, Codnor, and the builder Mr. G. Radford, Alfreton. It will cost 355*l.*, and seat 230 persons.

Sharlston.—The foundation-stone of a new church has been laid at Old Sharlston, a populous colliery village, about midway between Wakefield and Pontefract. It will be built of local stone. The contractor for the works is Mr. J. Freeman, of Hemsworth. The architects are Messrs. Micklethwaite & Clarke, of Westminster.

NEW BUILDINGS.

Burslem.—The foundation-stone of a cottage hospital in connection with the Haywood Charity, at Burslem, has been laid. The hospital forms part of a scheme for the alleviation of suffering among the sick poor, the origin of the charity being the munificent bequest of 30,000*l.* some years ago by Messrs. Howard & Richard Haywood, brothers, who were natives of the town. Mr. G. B. Ford, of Burslem, is the architect, and the builder, Mr. Wm. Cooke, whose contract is for 2,300*l.*

Nottingham.—The foundation-stone of new union offices in Shakespeare Street has been laid. Plans for an imposing block of buildings have been prepared by Mr. A. H. Goodall, architect, Market Street, Nottingham. Pressed red bricks relieved by blue Handsworth stone dressings will be used in the erection of the exterior of the fabric, which is estimated to cost 12,000*l.* The contract for the foundations was secured by Mr. Henry Vickers, of Wilford Road, and this portion of the work has been carried out substantially and satisfactorily under the superintendence of Mr. G. Jones, clerk of works.

SCHOOL BUILDINGS.

Pilsley.—The foundation-stone of a Church Sunday school and institute has been laid. The building will be of red bricks, with stone facings. The contractors are Messrs. W. Hall & C. Rouse, builders, of Pilsley. Mr. W. Haslam, of Hardstoft, is the architect.

Wigston.—A Board school to accommodate 500 children has been opened at South Wigston. The architect is Mr. Arthur Wakerley, of Leicester, whose plans were chosen in competition with seven others, and the builder is Mr. C. Sharpe.

Stanwix.—New schools erected for the School Board have been opened. The contractors—all local men—were as follows:—Messrs. C. & J. Armstrong, mason and brick work; Mr. George Black, carpenter and joiner's work; Messrs. Thompson & Son, plumber's work; Messrs. Smith & Son, slater's work; Mr. Ferguson, plasterer's work; and Mr. Graham, ironwork. The work was carried out from designs by Mr. C. J. Ferguson, F.S.A., architect, Carlisle. The school and classrooms are fitted with the Manchester school grates.

GENERAL.

The Aberdeen Artists' Society opened their second annual summer exhibition on Monday. The pictures hung number about 500, as against 700 last year, 120 works being rejected.

Sir T. Spencer Wells will preside over the Sanitary Congress that opens at York on September 21.

Mr. E. Fisher Smith has notified his intention of offering to the Dudley School of Art a piece of sculpture from Florence.

A Memorial Portrait of Sir A. C. Campbell, M.P., is to be painted.

The Sketching and Art Club of the Leeds and Yorkshire Architectural Society held a meeting last Friday evening, when the drawings produced during the past month were exhibited. Amongst them are Mr. A. Whitehead's drawings of *Fountains Hall*, *near Ripon*, and *View of Kirkstall Abbey*; Mr. Frank Haigh's *Tower of Fountains Abbey*; and Mr. A. E. Dixon's *West Doorway*, *Headingley Church*.

The Royal Cambrian Academy of Arts was opened at Conway on Monday. A jubilee album of original drawings of picturesque scenes in North Wales is to be presented by the members to the Queen.

Mr. P. Magnus, the Director of the City Guilds Technical Institute at South Kensington, is to receive the honour of knighthood.

Mr. R. Pratt, of Eastbourne, has been appointed borough surveyor of Henley.

The Drinking Fountain designed by Mr. Basil Champneys, and erected on the Thames Embankment as a memorial of the late Professor Fawcett, was opened on Tuesday. It was executed by Mr. T. Elsley, the modelling being done by Mr. G. Frampton.

The Authorities of Brussels have entered into a contract with an English company for the electric lighting of the streets in the centre of the city.

Roman Remains have been discovered during excavations in Hermon Street, Chester-le-Street. A well has been discovered about 3 feet in diameter, walled with stones, chisel-dressed, the well gradually tapering to the bottom. In it was a stone, about 2 feet high and 9 inches square, cleanly chiselled and moulded. There was also found a funeral urn.

Mr. John Clutton, who acted as arbitrator in the case between the Governors of Christ's Hospital and the Postmaster-General, ha war ded the sum of 129,937*l.* as the value of the property in St. Martin's-le-Grand, required for the enlargement of the Post Office.

The Rev. Canon Jacob has obtained from an anonymous donor 15,000*l.*, in New South Wales bonds, in aid of the fund which is being raised to erect a new parish church at Portsea. There will be 280*l.* interest accrue on January 1, and by the time the money is required it is expected that the donation will amount to 16,000*l.* Mr. A. W. Blomfield is the architect.

The New General Post Office in Paris, of which M. Guadet is the architect, will be opened on September 4, the anniversary of the proclamation of the Republic.

Plans for Providing further market accommodation on the vacant triangular piece of land abutting on Snow Hill, Holborn, to the south of the present fish market, have been adopted by the Common Council, and referred to the Markets' Committee for execution.

The Plans Committee of the Aberdeen Town Council have sanctioned the plans of a new circus proposed to be built in Bridge Place by Mr. John Henry Cooke. The building will cost 2,000*l.*

The Aston Local Board on Tuesday appointed a committee to consider the question of obtaining a suitable site for the erection of baths, the plans and cost of erection, and the estimated cost of maintenance.

A Poll of the inhabitants of Newcastle-under-Lyme, taken on the question of providing public buildings at a cost of 22,000*l.*, has resulted in an adverse verdict.

The Architect.

THE WEEK.

The majority of the schools of the country have been for years under the Science and Art Department for the teaching of drawing. The public have a right to expect some result for the expense. According to the reports of the Department inspectors the progress is most satisfactory. When, however, independent tests are applied a very different judgment is passed. The examiners for the City and Guilds of London Institute are impartial, and they have the best opportunities for ascertaining the quality of the work of candidates who have been in the Department schools. In their reports it is very common to find remarks which suggest that drawing is the weakest point with most of the students. The examiner in coach-building says the knowledge of drawing possessed by the majority of candidates was "lamentably deficient." The examiner for wood-working says "the pen-and-ink sketches show very small capability." The examiner for pattern designing says the papers generally "are of a very low standard." The examiner in milling says that with few exceptions the candidates "are unable to make intelligible sketches of simple matter." The examiner in electric lighting says "very often a wretched scrawl served to illustrate a reply." These results are extremely unsatisfactory, for they are evidence that the students taught by the Department are incompetent when they have to utilise their drawing for a practical purpose. The authorities will, of course, refer all sceptics about the worth of their system to the successes of Academicians and Associates who have studied in the Department schools. Genius can overcome all that South Kensington may do to impede its progress, and the artists referred to do not acknowledge that they owe much to the schools. What is most needed is a general competency in simple drawing, and it is evident that is not to be found. An alteration in the mode of teaching is therefore necessary.

The Royal Archæological Institute could hardly find a more fitting place for a meeting than the city selected this year. Thirty years have elapsed since the last meeting in Chester, and in that time many changes have taken place. The St. John's Tower is among the remains that are no longer to be seen, but some compensation for losses of that kind is to be found in the restored cathedral and priory, and in many new buildings. Indeed, the corporation address referred to the general improvement in architectural style exemplified in the city since the last visit; and other corporations would do well to imitate the example of Chester in testifying to what has been done by architects.

It is a rather novel experiment for provincial archæologists to select London as a hunting-ground. Although so little known, few regions are more productive. An adventurous party belonging to the Archæological Section of the Midland Institute, Birmingham, undertook the task this week, and intend to occupy from Thursday to Saturday on the work. The programme includes the Roman antiquities in the crypt of the Guildhall, and other relics of Roman London; Lambeth Palace, the Charterhouse, the Tower, Sir John Soane's Museum, Westminster Abbey, Romano-British antiquities in the British Museum, and the Temple Church. Mr. A. W. Franks will give the visitors the benefit of his great knowledge when they arrive at his department in the British Museum, and at the Guildhall Mr. Overall, the librarian, and Mr. C. Roach Smith will undertake the office of guides. It may be interesting to people in the provinces who wish to try a similar experiment to know that the sum charged for all expenses is 2*l.* 15*s.* 6*d.* per member.

At the last meeting of the Metropolitan Board of Works it was resolved "That Mr. George Vulliamy be appointed superintending architect for a further period of three months, namely, from September 29 until December 25 next." The meaning of the resolution is that some difficulty has been found in filling up the office, and a further delay is requisite. It is expected that a larger number of candidates may be attracted. The applicants for the office are much disappointed, and with reason, for it was anticipated that the election would be over before the Board adjourned for the vacation.

The news of the death of Mr. F. W. Moody, who was for many years Professor of Decoration at South Kensington, will be heard with regret. He was a man who never lost his individuality, although he served in a Government office, and of very few ca so much be said. Mr. Moody was an enthusiast for Renaissance art, and he seemed at times to have many of the characteristics of the old Italian artists. In self-confidence at least he resembled them. His manner had an attraction for students, who like always to meet with a teacher that has something definite about him. Mr. Moody carried on the work that had been done by Stevens and Sykes, and, like them, helped to impress an Italian character on those students who came under his influence. Whether that was an advantage we need not now discuss, but at least that style seemed to be in keeping with the soul of the teacher.

The report of the Commissioners of Inland Revenue supplies statistics about houses on which house duty has to be paid. For the year 1885 the number of inhabited dwelling-houses on which the tax of 9*d.* in the pound was levied amounted to 816,564, being an increase of 7,293 over the year preceding. The annual value of the houses was 42,464,971*l.*, the increase being 366,529*l.* It is remarkable that in the three divisions of property which are subjected to a sixpenny rate there was a decrease in number. Thus there were 243,209 shops or warehouses in 1885, while in 1884 the number was 244,306. The beer-houses were 84,046 against 84,688, and the farmhouses 32,568 instead of 32,786. The figures are expressive of the depression which the country has been undergoing. The increase of the number of buildings charged will in consequence be reduced from 7,293 to 5,276, and the increased valuation from 366,529*l.* to 182,209*l.* The decreases were largest in York, Somerset, Lancaster, and Durham. Dwelling-houses valued at less than 20*l.* do not pay inhabited house duty. There was a slight increase in that class of property, but it was hardly proportionate to the needs of the times. The property described as "houses belonging to Her Majesty" and "houses occupied by foreign ambassadors" increased during the year from 322 to 385, but the 63 additions were only valued at 16,267*l.* Hospitals, schools, and houses for the relief of poor persons increased from 20,509 to 21,918. It may surprise taxpayers when they learn that the houses which are not assessed for house duty are more than double the number of those which are. All that tax is borne by 2,051,491 houses, while 4,986,673 are exempted, the larger number of the latter being houses valued at less than 10*l.*

The ordinary assessments for income-tax do not correspond with the valuation for house duty. Under schedule A the value of "lands" in England and Wales is 47,594,178*l.*; in Scotland, 7,461,957*l.*; and in Ireland, 9,983,031*l.*; making a total of over sixty-five millions. The decrease in value last year was 0·75 per cent. in England, and 0·57 per cent. in Scotland; the principal decreases being in York, Essex, Northampton, Norfolk, and Lincoln. The total decline in the value of lands, which has been continuous since 1879–80, now amounts to 4,509,630*l.*, which must be further augmented by the repayments of duty in the past year and discharges from assessment since the last new valuation of property in 1882–83, owing to agricultural depression. The total, so far as shown in the income-tax records, amounts to about 5,265,000*l.*, or about 8 per cent. The houses in England and Wales are valued at 112,790,729*l.*, in Scotland at 12,279,808*l.*, and in Ireland at 3,481,724*l.* It will thus be seen that the houses more than make up the difference between Scotland and Ireland in respect of lands.

ACADEMY REFORM.

THE letter on the Royal Academy, signed by Mr. Holman Hunt, Mr. Walter Crane, and Mr. George Clausen, which appeared a few days ago, is only the latest expression of discontent among painters, for something similar has been heard from the foundation of the Academy. In this case the discontent was inspired by the failure of the reform party in the Academy—although aided by the President—to induce their brethren to agree to a reduction of the number of works which every member can insist on exhibiting. At present the regulation number is eight, and four was proposed instead. Considering the quality of the works which some Academicians have been producing of late, we must say that four is an ample allowance, for the blank wall space would be preferable to certain of those masterpieces.

The writers of the letter wish the public to recognise that the Royal Academy is a private society, which has always asserted and maintained its privacy, and, after so long a contest for the interests of its members, it should be left to enjoy its rights in peace. The exhibitions held in Burlington House have therefore no claim to be called "national," and there will not be a really national exhibition until one is established which shall be conducted by artists on the broadest and fairest lines, in which no artist shall have rights of place, and all works shall be chosen from a jury elected by, and from, all artists in the kingdom. That is to say, our annual exhibitions must be on an inequitable basis until the system of the Palais d'Industrie is substituted for that adopted in Burlington House.

It may as well be admitted in the first place that the Academicians are acting within their rights. According to the original diploma of King George, every Academician was granted "all the emoluments" pertaining to his position. What they were remained undefined, and it is allowable in the Academicians to put their own interpretation on the phrase. They have declined to accept the words in one sense; for, with all their faults, the Academicians have never employed the funds for their personal enrichment. It would be better if they showed themselves inspired by a spirit of self-sacrifice in disposing of the wall space in their galleries, but in these times we must not expect too large an amount of heroic virtue in mortals. The plan of their society was not wisely laid down, if the interests of art rather than of a few fortunate individuals were to be promoted, but it should not be forgotten that originally the Academy was only a sort of royal fad. King George spoke of it as "my exhibition," and Reynolds in his opening address gave the credit for the design to His Majesty. Under such circumstances it was hardly to be expected that the Academy should be equal to the requirements of artists who lived a hundred and twenty years afterwards. It deserves also to be remembered that in the preparation of the laws of the Academy there were three foreigners engaged against one Englishman. In this way we may account for any absence of a spirit of fair-play which may be inherent in the constitution of the society.

The history of the Academy testifies that the Academicians acted as if, like the Gentiles, they were a law to themselves. If we credit Northcote's statement, the first gold medal that was offered for an historical painting was awarded to an incompetent student. He had been useful, however, in giving evidence on behalf of Baretti, when the Italian was tried for murder, and the foreign Academicians were in consequence partial to a young fellow who helped a foreigner out of a difficulty. Barry was expelled because he was so simple as to imagine that the Academy was under an obligation to the public, and was bound to expend some of its funds on the library and school. Professor Cockerell was on the point of expulsion, because he also expressed his thought. According to Reinagle, the Academic conscience has often been shown to be of the most accommodating kind whenever members of the exclusive or anti-reform party were concerned. In fact, the majority in the Academy has shown itself to be as selfish and as merciless as any Venetian oligarchy. Sir Martin Shee, who, as a mover among the majority, was raised to the presidential chair, to the surprise of those who judged him by his paintings, described what was done and what ought to be done by the Academicians when he said:—"To have the interests of our rivals in our hands, and hold the means to injure or to serve, affords an opportunity which generosity will accept for its honour, selfishness will seek for its advantage, and malevolence will seize for its gratification." The examples of generosity in that way have been effectually concealed by the Academicians.

As we have said, the Academy never professed to be more than a private society (it was so designated by the secretary before a Parliamentary Committee), and as such displayed the narrowness of a trades union or of one of the old trade guilds. The accepted members took the whole of the credit for everything done that had any worth. It was officially stated at one time that the existence of the Academy was solely due to "the talents of the members only." Academical imagination flattered itself, and we dare say still does, that the public paid their shillings to see the pictures of the Academicians. The rest of the works were admitted to serve as foils to them. "It is not true," said Mr. Howard, when secretary, "that the money produced by the exhibition is in a great measure raised by the works of the artists who are not members; it is the excellence of the works which is the attraction," and the excellence was, of course, confined to Academicians and Associates.

According to the ideas of the Academicians, there is no small condescension in opening the Academy to the works of outsiders. Being a private society, like the "Mirlitons" or other art club in Paris, the walls are supposed to belong to the members, and the proposal to abandon their right to as much space as is needed for eight pictures, no matter what their area might be, was therefore considered to be revolutionary and communistic. For it must not be overlooked that the Academicians claim to hold their privileges and their property direct from the Crown, and are, therefore, as independent of Parliamentary or other powers as a Norman baron in the good old times. Some years ago the Government was informed that the Academicians did not consider themselves amenable to any control except the will of the Sovereign, and they act as if such a power as public opinion could not reach the council-room. We cannot blame them, for their title to their property corresponds with that by which the oldest estates in England are held.

The Academicians have acted on this principle for nearly one hundred and twenty years. It has also been recognised tacitly by the State. As in England rights of property must be respected, no matter who suffers, it would be unconstitutional to interfere with the prerogatives of the occupants of Burlington House. The proper course would be to leave such privileged persons to the enjoyment of their own galleries. Let each of the painters hang eighty pictures on the walls, if he is able to produce that number, and, if the public will pay for seeing them, no one would have the right to complain. Such a course is, however, impossible. After so long a period of omnipotence the Academy is not to be readily displaced, although it may not be always just in its dealings with artists who are competitors of the members.

Nor is a substitute of a perfectly impartial kind easily raised. The French Salon is in theory of that class. The juries are elected by exhibitors, and hold office for no more than a season unless they are re-elected. But every year complaints are heard from painters whose works are rejected, and from painters whose works are placed in remote galleries and in unfavourable positions. The French Society of Artists is likewise in an unstable position. The State can, at any time, refuse to grant the use of the building where the exhibitions are held, or may set up a rival exhibition. Either proceeding would be full of risk to the existence of the society. In London there is at least no danger of that kind.

It may also be questioned whether, under the modern conditions of buying and selling, an able artist does gain much by the exhibition of his pictures in an Academy exhibition. At one time it was advantageous. "If the public are competent to single out and discover talent themselves," said Sir Martin Shee, "it is vain to talk of the distinction of R.A.; it is because the enlightened classes are incompetent judges that it is necessary for artists to decide who are entitled to Academic advantages." The dealers now have assumed the office, and it is by their opinion of future value that purchasers are guided. We

know artists who are regular exhibitors, and whose works are always well placed, but who rarely sell pictures from the Academy. In the case of architects little difference could be felt, no matter how high-handed the Academicians might become. It has never once occurred, we believe, that an architect obtained a client through the exhibition of a design. Mr. Holman Hunt is a living example of how influential an artist may become without academic distinction. His best works have not been seen in Burlington House, and yet they are as well known as any of our time. We have also a remarkable example in the late Gustave Doré. He was not an exhibitor in the Academy, and in the Salon he was generally represented by very small landscapes, yet he was about the most popular artist of his generation. On the other hand, it is well known that several Royal Academicians, although their pictures occupy prominent positions in the exhibitions, cannot attract purchasers for them until they go through a course of wandering among provincial towns.

The men who profess to have felt the envy of the Academicians may not have suffered much if they are occasionally excluded. Those who have not been sufficiently complaisant to gain the favour of an Associateship need not complain if they think much of their art. In too many cases an election is followed by a decline in the character of the painter's work. But, whether outsiders suffer or not, it is vain to sigh for the reformation of the Academy. The annual dinner condones for many defects in the eyes of the authoritative classes, and the effusive eloquence is more than a match for the grumbling of the discontented. The Academy is only one of many anomalous institutions, and is not the worst among them.

ROMANESQUE AS A MODERN STYLE.

[By a Correspondent.]

IS it not rather surprising that this style has not yet been more generally adopted as one of the many revivals which have found favour with architects in this country? The modern examples could probably be counted on the fingers of one hand; yet no style of the past would appear to require so little modification to render it perfectly applicable to the state of the advanced civilisation of our era. Structurally, it is in every respect the equal of the Pointed style, of which indeed it was the parent that retained many old-fashioned but noble characteristics, such as columns as large as in Classical edifices, and a general breadth of treatment that was lost in the later splendours of the Gothic style. The unbuttressed, or slightly buttressed, walls seem specially to recommend the style for urban architecture. All materials were freely adopted or adapted by the Romanesque architects: the clay of Lombardy was invested with value and dignity, and that subtle charm which, as Gruner says, we involuntarily experience on discovering the perfect adaptation of simple things to great uses; the variously coloured stones of the volcanic district of Auvergne used in the noble churches of Clermont, Brionde and others for external mosaic work, in place of the arcaded galleries of Germany and Italy, and which Fergusson tell us is "the only specimen of external polychromatic decoration now to be found so far to the north;" and the splendid marbles of Italy were no less eagerly sought and applied. Then for variety of outline no style surpasses the Romanesque. There are towers and cupolas of all possible forms—square, hexagonal, and circular—and round arched vaulting used, as Mr. Quilter says, "with a disregard of convention for which I know no parallel. The Roman arch, the Byzantine dome, the Arabian minaret, the square tower, the mosque, the basilica, and the temple were all mingled here, yet executed with the utmost simplicity of material. . . It is difficult to say whether the first impression produced is wonder at the variety, indignation at the eccentricity, or delight at the effect of the whole building." With all this there are examples of great simplicity, *i.e.*, the Basilica at Treves, and no style can claim a wider geographical range, extending, as it does, from the shores of the Atlantic to those of the Adriatic, and from the north to the south of Europe.

When writing of Romanesque, the late Sir M. D. Wyatt said:—"The principal quality consisted in the effect of vastness produced by the multiplication of regular subdivided parts, equally subdivided themselves in their turn. There may be perceived (in these buildings) vigour and life, indicative of a state of germination, a casting off, as it were, of an old skin to put on a new one, and after the throes of labour to give birth to an entirely new creation."

THE RESTORATION OF ST. MARK'S, VENICE.

SINCE the time when the repairs on St. Mark's excited such furious obloquy and stormy discussion little has been heard, says a correspondent of the *Times*, of the restorations on the great buildings of Venice. One might suppose that they had at that day been inaugurated, and that as a result of the English denunciations the repairs were stopped, while the simple fact is that, according as means permitted, the work has been going on ever since 1840, and that before that at various times the Venetian Republic had restored and rebuilt as the stability of St. Mark's required. A curious evidence of this was three or four years ago brought to light. In repairing the façade of the portico of the church a large stone tablet was removed, disclosing on its hidden face a long inscription containing a treaty between two Cretan cities. This inscription was sent to Professor Comparetti, who recognised in it a lost inscription which was unsatisfactorily transcribed in Venice about two hundred years ago, and has never since been seen, until the recent repairs in the façade of St. Mark's rediscovered it.

The fact is, as I showed in a letter which was a contribution to the discussion above alluded to, that St. Mark's was built by men who were admirable artists but wretched builders; it was built probably in parts, and without any appreciation of the artistic importance it should one day have, or much care for the elements of stability requisite for the prolonged existence it has enjoyed. In the renewal of the little pavilion at the south-west angle, which is only attached to the church at one side, but serves as a flying buttress, and bears the thrust of the outer walls of the two chapels on that side, the foundations were found on excavation to consist of piles about six feet long, on which was laid a mass of uncemented rubble a yard or two thick (I do not now recall the exact thickness then stated to me by the architect, now deceased), and on this the bases of the columns were laid. As lately the accusations brought during the old discussion have been authoritatively repeated, and as the work is now being completed, I think it may be worth while to restate the substance of what I then said as to the reasons for demolishing and reconstructing this corner of the church. The wall on the south side of the southern aisle had split from top to bottom from the wretched quality of the material, both brick and mortar, and from the use of sticks of fire-wood, which had been used in the piers as binding material and, perhaps, to save masonry. The mortar had almost lost cohesion, the bricks could be rubbed to dust by the fingers, and the wood had not waited to be rubbed, for nothing but dust remained of it. The outer pier of the south-west pavilion was sinking from the insufficiency of the foundation, and the whole south wall of the two chapels had long been prevented only by extensive shoring-up from falling into the piazza and carrying with it the vault of the chapel, and with it all that face of the south aisle wall which was detached from the inner face by the cleft I have spoken of, as well as everything which supported from without the vault of the south aisle. This crack was getting worse in spite of the shoring and the braces and ties which had been applied from within.

The whole outer wall of the chapels and the entire pavilion was taken down, the brick masonry inside it repaired as well as possible, and, solid foundations being prepared, the pavilion and wall were rebuilt, the marbles, which formed a thin shell over the brickwork, and the columns, entablatures, &c., of the original structure being restored as far as the stone cohered still; the vacant places were filled by pieces of the same material as the original where it was attainable, and where not by the nearest substitute for it. The old sculptured material was all preserved intact and restored to its original position. The columns, corroded on the sea side, were turned round so that a new surface was exposed; not an old stone that was utilisable was rejected, and only the incrustation of marble plates was renewed and two or three columns. This was the condition in which I saw it. The Chevalier Meduna, who, with his elder brother, had been in charge of the church for half a century and reverenced every stone in it, has followed his elder to the grave, and the works are now in charge of another not less conscientious and reverential architect, Dr. Pietro Saccardo, who has his hoarding now around the pavilion, to complete the work of Meduna by restoring the marble shell in places where the new structure had not in Meduna's day settled to its bearings and now receives its new coating of

marble. Saccardo has gone further in some details than did Meduna, because he has by diligent search found fragments enough of the various marbles employed by the early builders to be enabled to remove the substitutions made by Meduna and replace them with material identical with the old—the verde di Genoa by the verde antica, and the grey Italian marble by the original grey Greek. But so difficult to obtain were these, that the latter, which was in the original used in slabs, has been cut into very thin plates, which are cemented on substantial slabs of marble of Carrara, fastened with nickel bolts, and then this compound plate is cemented in its place. The old south wall of the chapel was disfigured by a sixteenth-century tomb which Meduna had removed, restoring the wall to keeping with the whole façade, but in the substituted material. This Saccardo has removed, putting in its place the genuine antique material as elsewhere. The veneering of the south-west angle of the chapel and the south doorway remain to be completed, and the church will then be freed from the scaffolding; but if any person with an eye to symmetry and the grace of the structure will look at the corresponding north-west pavilion, he will see it sinking in the same way below the level of the body of the structure, and only held to it by a complication of iron bars, which drag on the building itself and make the pavilion to be a burden instead of a support as it should be. This should be corrected; but, as less immediately imperative than the south-west pavilion, so the renovation will make less apparent change, the marbles there being in incomparably better state than were the old ones on the other angle. The only visible external restoration beyond those now mentioned are the correction of the cornice which, with the partial and unequal subsidence of the façade, had taken a wavy line more indicative of the picturesque than the stable, and which is now a straight line the entire length of the cornice.

The mosaics of the chapel, against the renewal of which so much outcry was made, have been completely changed, and the old mosaics, which were cleft and riven in scores of fragments, the glass cubes of which they were composed being in many cases wanting at both sides of the fracture for an inch or more in width across the whole subject, have been repaired with the best art of the mosaicist, and replaced on the walls of the chapel, only one composition of the entire series being absolutely irreparable, and being replaced by a new mosaic composed on the very slight indications of the old one. I have just been over the work carefully, and, without the indications of the mosaicist, and should not have been able to determine which is the new among the old, so perfectly has the spirit of the design and the tints of the old been followed. On this point I have the testimony of an architect and decorator of reputation, who, after seeing what had been done, avowed, enemy though he was of the restoration, that the new work was practically in all points as good as the old, though he added, "I would not tell them so, not to encourage them in going any further."

But, in spite of all partial repair, the cathedral is slowly sinking into "the mud of the lagoons," the tide ebbs and flows up under the great dome, and yesterday I saw the water standing on the floor of the crypt, which was walled in and cemented only a few years ago, it was hoped impermeably. The earth on which the church stands is being slowly washed out by the flow and ebb, and the foundations of the church are unequally subsiding. The old piers of the first church, which are under the nave and transept, bearing no weight, do not sink equally, and are lifting the floor into waves, which make it perilous walking on it, and which are increasing perceptibly, it seems to me. Nothing can stop this but the sinking around the entire church of a solid, impermeable wall to keep out the salt water, within which the foundations may be made as stable as the site will permit; or the inner face of the foundations must be laid bare and the entire area of the church must be excavated and similarly treated, after which the floor-level may be restored and the pavement, with its invaluable decorative designs, rescued from the destruction it is now undergoing. In many places the mosaics are already effaced under the tread of visitors' feet; the people who stigmatise the restorer of those which have been preserved being among the most eager to denounce any attempt to preserve them by the only means which will suffice, *i.e.*, copying them in solid workmanship while enough of the original remains to follow the design. This is in some places already impossible, but most of the patterns are still practically complete.

I want particularly to insist on the fact, utterly ignored or denied by the denouncers of the restorations, that these are purely structural, only undertaken where the stability of the church is impaired or the destruction of its decorative qualities threatened. But for the general system of repairs so long going on, the whole church would in all probability have been before this a mass of ruin. In all that has been done there has been, it seems to me, no needless renovation, and the old sculptural work has always been restored to its place without being scraped or cleaned except by washing with water, the plain marbles and undecorated parts of columns being alone polished to preserve the stone from the action of the elements, the old carious surface inviting decomposition. The Republic employed men to scrub the stone and keep it clean from the accumulation of dirt and incipient vegetation which disfigure it and imperil its surface; more than this its successors do not propose, and less they cannot safely do. The Government allows only 2,000*l.* a year for the repairs, &c., of St. Mark's, which is much less than Austria allowed. In my unprofessional opinion this, if insufficient, is, as far as it goes, well and wisely spent. Only an architect can criticise the technical appliances, and this I make no attempt to do; but, as far as the æsthetic result is concerned, I do not see how any fair-minded person who respects the artistic character of the church can find fault with what has been done, if he will only take pains to find out how much and what it is.

THE LORDS' COMMITTEE ON ELECTRIC LIGHTING.

THE evidence taken under conditions of such extraordinary secrecy by the Earl of Camperdown's Select Committee upon the three Bills introduced by Lord Rayleigh, Viscount Bury, and Lord Houghton last session to amend the Electric Lighting Act of 1882 has at length been issued, three months after the issue of a brief report of the Committee's decision. Owing to a difference of view in the House of Lords at the last moment, viz., on the report stage, the Bill, finally approved by the Committee (Lord Houghton's), which was virtually a Government measure, was withdrawn, and nothing further was done. The matter has, however, become of such importance that it must be taken up again very speedily, and a glance at the most valuable evidence recently obtained will be of service in view of further action. In late years the electric light as a general illuminant has made practically no advance in this country, and it has been widely held that this stagnation is mainly due to clause 27 of the existing Act, which empowered any local authority to compulsorily acquire at the end of 21 years any installation within the area of its jurisdiction at the then value of the undertaking, without compensation for such compulsory purchase or any allowance for goodwill, profits, or anything else. Lord Rayleigh's Bill (No. 1) to remove this grievance proposed to repeal the 27th clause, and among other things to put electric lighting in exactly the same position as gas as to profits, purchase, &c. Lord Bury's Bill (No. 2) also proposed to repeal the 27th clause, and to substitute a provision enabling a local authority to purchase at the end of 41 years an installation on paying the then value of the undertaking as a "going concern." Lord Houghton's Bill (No. 3) proposed to substitute 42 years for 21, or 30 years where 42 were not specified, and to empower the Board of Trade to determine the conditions of purchase. The Select Committee to whom all three Bills were referred examined more than twenty witnesses—electricians, scientific men, municipal representatives, and business men—the evidence occupying seven or eight sittings, and numerous petitions for or against the several measures were received.

Professor George Forbes, M.A., F.R.S.E., explained the various methods available for the distribution of electric lighting, and observing that in 1882 there were no engineering difficulties which need have stopped the progress of electric lighting, said that had there not been some other barrier we should now have had numerous examples of central-station lighting on a large scale in this country. American towns were generally well supplied by means that were well known in 1882, and his conclusion was that the Act of 1882 had been the main difficulty and impediment, the conditions in that Act being far more stringent than those imposed on gas undertakings. There was now in existence only one central lighting station in the United Kingdom on any large scale, and he thought that fact was perhaps the strongest evidence that the Act of 1882 had something to do with the matter. That station was the one distributing from the Grosvenor Gallery buildings, and the peculiarity of that installation was that no appeal had to be made to the Act, because the wires were carried overhead and there was no necessity to break up the streets. In America there were stations not only in almost every important town, but the system was being introduced in almost every new town and village, and on the Continent of Europe electric lighting was almost universal. So far as he could see, electric lighting, from an engineering point of view, could be made a practical thing if people were allowed to put money into it and get a return, but not if they had to give a bonus in any form to local authorities. There was no such margin possible at present that the light could succeed in spite of legislative obstacles. Referring to probable improvements in electric lighting in the future, he strongly objected to the provision in the Act under which, at the end of twenty-one years, or, if not then, at the expiration of every succeeding seven years, a company could be bought up, pointing out that while this possibility was hanging over them they would not adopt the improvements which

might benefit the public. The ten years' successive period proposed in the Government Bill would have the same deterrent effect. He did not consider even forty-two years long enough to return a profit on the lines of the Government Bill, but he thought it would not take many years to attract customers. As to cost, he did not expect that, although lamps might become cheaper, electricity would become cheaper; that could not well be expected, seeing that the machines producing electricity were converting something over 90 per cent. of mechanical power into electricity.

Mr. Rookes Crompton informed the Committee that, as engineer to the Edison-Swan Company, he designed the installation which was intended to carry out the provisional order under the Act of 1882 for lighting Victoria Station, and then stated that, although the company had spent 16,000*l.* on the generating station alone, they found the conditions in the provisional order and in the Act so onerous that they stopped the undertaking, and the 16,000*l.* had in consequence remained unproductive. The purchase clause (27) was the sole and entire cause of that stoppage. A similar result ensued with regard to an effort by the Crompton-Winfield Association, Birmingham, to establish an installation for lighting Birmingham and the district. In the provisional order for that purpose the limit for purchase was sixteen years, but they could not get the capital owing to the purchase clause. Incidentally he mentioned that although his company had fitted up all the machinery for electric lighting in Vienna, at the last moment the authorities, seeing that facilities were not given in England, had suddenly disallowed or put difficulties in the way of completing the undertaking; and he further stated that there were no engineering difficulties in the way of house-to-house electric lighting in detached installations and on a moderate scale. Difficulties might crop up when this was done on a large scale requiring new arrangements, but nothing had occurred since 1882 to show that a large number of moderate house-to-house installations could not have been carried out then. The real difficulty now was the financial difficulty. There would be no difficulty in getting the capital if the electric light was placed on terms equal to gas, and he much preferred Lord Rayleigh's Bill (No. 1). That would give no unfair advantage, and he could not see that there would be any monopoly. In fact, electric light, coming in as a second illuminant, would further diminish the monopoly of gas.

Sir Frederick Bramwell, F.R.S. (a shareholder in the Edison-Swan Company), after describing some improvements made in incandescent electric lighting since 1882, said he did not know of any improvements made in the means of distribution, and he attributed the want of progress entirely to the character of the Act of 1882. On that point, he said, nothing could be more instructive than the fact that all but one of the fifty-five Provisional Orders obtained in 1883 had been abandoned. The Act had not only prevented public installations to any extent, but had operated in the same way against the use of the light as a luxury in private houses. The mere extension of time to forty-two years would not meet his objection to the Act. With only that extension the necessary capital for developing a concern would not be obtained; and a further objection he had to No. 3 Bill was that he disapproved of making governing bodies traders. With regard to Bill No. 2, if a "going concern" was properly defined so that it could be carried out on the mode of valuation that had prevailed in the case of many transfers he had taken part in, and then a sufficiently long time was given for the development of the concern—say, forty-two years—he thought there would be no difficulty in getting capital. He admitted that he had had a considerable share in framing Bill No. 1, and he contended that similar legislation to that bearing upon gas would be the most satisfactory solution of the matter—first, because it would protect the public in the way they should be protected; and, secondly, because it was free from the vicious principle of at any time giving powers to local authorities to become traders. Years of experience had shown that the legislation as to gas had been beneficial to the public, and all that was now asked was that electric lighting should be put on an equal footing with gas, and that no favouritism should be shown to gas by severe restrictions upon electricity.

Mr. J. S. Forbes, chairman of the Edison-Swan Company, expressed the conviction that under the present Act electric lighting would not be obtained—at all events out of any private enterprise. He had tried to induce people to find money to carry out the Act, but he had not succeeded because of the 27th clause. He had been to skilled capitalists, but he could get no encouragement because the term of twenty-one years was too short to allow of a probability that the normal value of the business would be developed, and because at the end of the term the conditions of resumption were such as no capitalist would look at. No. 3 Bill, therefore, he described as of a repellent character; no capitalist would touch it; but No. 1 Bill, he thought, was a workable Bill, possessing advantages which No. 2 did not. It gave the public greater protection; and, taking the gas analogy, it gave undertakers the strongest inducement to develop for their own advantage, and as much for the advantage of the public, a liberal return of interest, and the possibility of increasing that interest as the condition of reducing the price.

Sir John Lubbock (also a shareholder in the Edison-Swan Company) took a similar tone, believing the present terms of purchase to be almost prohibitory. Not only, he said, did they authorise local authorities to acquire an undertaking at the end of a period which was too short to allow of its satisfactory development, but by the restrictions they imposed they made it almost absolutely certain that if the concern had been successful it would be acquired at less than its real value. He also objected to public authorities being allowed to carry on commercial undertakings, mentioning by way of illustration that we had lost a million and three-quarters over the purchase of the telegraphs; and observing that there were many other elements in the case than clause 27, he expressed the view that, with either No. 1 or No. 2 Bill, the other elements remaining the same, it would be possible to give a fresh impetus to electric lighting.

Mr. Wm. H. Preece, F.R.S., electrician to the Post Office, gave evidence mainly as to the interests of that department in the spread of electric-lighting wires. Citing his experience in the United States, where overhead wires abound and accidents are frequent, he protested strongly against what he called "marauding companies" being allowed to establish overhead installations without any legislative control (as in the case of the Grosvenor Gallery), and even in spite of Acts of Parliament. He explained the public danger involved by the erection of overhead wires without restriction, and said that, even if controlled, such wires often seriously interfered with the working of the telegraphs and telephones, because these wires using rapid alternate currents of electricity these rapid reversals of electricity disturbed both telegraphs and telephones in the neighbourhood. At Newcastle he had found that such disturbance was created at a distance of 3,000 feet. This could be avoided if proper regulations were enforced, and therefore he urged that the evil should be checked at once.

Mr. Calcraft, Permanent Secretary to the Board of Trade, referring to the proposal in No. 1 Bill to put electric lighting on the same footing as gas, and to introduce the sliding scale, stated that at present, when a new gas undertaking came before the Board of Trade, it was not the usual practice to authorise an initial price and the sliding scale, because they had not at that time sufficient experience to show what would be the expenses connected with the introduction of gas or the demand for it and other details. Applying that principle to electric lighting, he thought it would be utterly impossible to fix a proper initial price for such a scheme in the first instance.

Mr. Robt. Hunter, solicitor to the Post Office; Mr. Albert Meysey Thompson, Major Armstrong, R.E., Mr. Shorebred, M.I.C.E., and several other witnesses were also examined, the majority blaming the Act of 1882 for the non-advance of electric lighting.

STONEHENGE.

At the annual meeting of the Wiltshire Archæological Society, held at Swindon on Tuesday, Mr. Story-Maskelyne, M.P., in the chair, the present condition of Stonehenge was discussed at some length. The Rev. A. C. Smith, one of the secretaries, read a special report presented by a deputation appointed by the society to inspect this great national monument, which is undergoing daily injury at the hands of the vast numbers of people who visit it and picnic within its precincts. The report gave details of the injuries sustained by the seventy or eighty stones of which Stonehenge consists, the burrows of rabbits forming an important factor in the mischief. The deputation recommended the formation of a sunk fence, so as to exclude all carriages from the precincts, and the appointment of a caretaker, who should admit no one inside the enclosure except under proper regulations. They also recommended that such of the stones as were unsafe should be pushed back to their original position and secured there, and that the great trilithon which fell in 1797, the former position of which is accurately known, should be replaced on its old site. Mr. Maskelyne cordially supported the movement. Although considering that a light iron fence was more effective, he regarded the matter as of paramount importance. In the course of the discussion it was deemed inexpedient to approach the owner, Sir Edmund Antrobus, whose expressed opinion was understood to be that he was doing all that was necessary for the preservation of Stonehenge. Canon Jackson supported the proposal to replace those stones, the former positions of which were known. On the motion of Mr. Maskelyne it was unanimously resolved to invite the co-operation of the national antiquarian and scientific societies in carrying out some measures for the preservation of Stonehenge.

TESSERÆ.

Trinity House.

J. ELMES.

A CELEBRATED politician in the last century acquired the name of Single-speech Hamilton, from the circumstance of having delivered an oration of much promise and great ability, and never again opened his mouth in Parliament: so likewise may the architect of one of the most original and tasteful buildings in London be designated by the title of Single-house Wyatt, from his only public work, the Trinity House, on the north side of old Tower Hill, now called Trinity Square. If John Nash be more polystructural than Samuel Wyatt, the latter may plead that although his progeny be not numerous, his single production is a lion. This building is a handsome stone and brick edifice, and extends from Cooper's Row on the east to Savage Gardens on the west, with extensive lateral fronts to both of these streets, and consists of a main body and two wings. The principal storey is of the Ionic order, raised upon a rusticated ground storey. Above the windows are some beautifully sculptured medallion portraits of George III. and his queen, sculptured panels in low relief representing genii with nautical instruments, and four of the principal light-houses on the coast. These sculptures are so beautiful in style and execution as to deserve being moulded, and casts made from them by the Royal Academy for the use of their students. The style of architecture used in this building is neither so pure as that selected by Stuart for the internal portal of the chapel at Greenwich, so pedantic as that copied by Wilkins in his portico of Downing College, Cambridge, nor so fanciful as that used by the Adams in the Adelphi; but is a successful adaptation of the Ionic order to proportions of his own, with too much elaboration of foliage in the capitals, trenching on those of the Corinthian. The mechanical execution of every part of this elegant building cannot be too much admired, so beautiful is the masonry and the brickwork of its exterior, that the best workmen both in brick and stone would find models for imitation. The first stone was laid September 12, 1793, by the master, assisted by the deputy-master and elder brethren of the corporation, and the offices opened for business in 1795.

Venetian Pavements.

C. H. WILSON.

The floors of rooms are finished with this pavement, as it is somewhat incongruously termed, and I shall briefly describe the mode of operation in making these, but must first observe that they are usually formed over vaults. In the first place, a foundation is laid of lime mixed with *pozzolana* and small pieces of broken stone; this is in fact a sort of concrete, which must be well beaten and levelled. When this is perfectly dry, a fine paste, as it is termed by the Italians, must be made of lime, *pozzolana*, and sand: a yellow sand is used which tinges the mixture; this is carefully spread to a depth of 1 or 2 inches, according to circumstances. Over this is laid a layer of irregularly broken minute pieces of marble of different colours, and if it is wished, these can be arranged in patterns. After the paste is completely covered with pieces of marble, men proceed to beat the floor with large and heavy tools made for the purpose; when the whole has been beaten into a compact mass, the paste appearing above the pieces of marble, it is left to harden. It is then rubbed smooth with fine grained stones, and is finally brought to a high polish with emery powder, marble dust, and, lastly, boiled oil rubbed on with flannel.

Shop Fronts in London.

PROFESSOR HOSKING.

The history of the shop-front is somewhat curious. The Act for rebuilding the City of London after the Great Fire (18 & 19 Car. II.) is supposed to have been drawn by Sir Christopher Wren, but upon what the supposition is based does not appear, unless it be the internal evidence of sound practical knowledge and general good sense which pervade the statute. This Act, after requiring that "the outsides of all buildings in and about the said city be henceforth made of brick or of stone, or of brick and stone together," with certain exceptions in that respect as to brestsummers "for conveniency of shops," directs that "no trap-doors or open grates be in any wise suffered to be made into any cellar or warehouse without the foundations of the front, but that all lights to be made into any of them be henceforth made upright, and not otherwise; and that no bulks, jetties, windows, posts, or anything of like sort, shall be made or erected in any streets, lanes, or by-lanes, to extend beyond the ancient foundations, nor that any house be set further into the street than the ancient foundations, saving only that in the high and principal streets it shall be lawful for the inhabitants to suffer their stall-boards (when their shop-windows are set open) to turn over and extend 11 inches and no more from the foundation of their houses into the street, for the better conveniency of their shop-windows;" that is to say, the shop window-board might be hinged as a flap and be turned out when the shop-window was open, as a stall, upon which to expose goods for sale, and, of course, to be turned in when the window was shut. The next time the stall-board makes its appearance in a Building Act, the permitted turn-over flap had become a fixed projecting base to the bayed or bowed and fixed shop-window, enclosing the space allowed by law to the hinged flap while the shop was open only; and the pent-house shelter for the public, which the Act of Charles II. had required to be made over the paved footways before the houses, had become the cornice to the protruded shop-front. Thus a "bulk" with "windows" in it came to be extended "beyond the ancient foundations," contrary to Sir Christopher's wholesome provision as to such things; and after time had honoured the abuse by winking at it for two or three generations, the 12 Geo. III. c. 73, made a bow-window or other projection "for the convenience of a shop or shops" an exception to its general prohibition of "bow-windows or other projections against or before any house or other building situate in any public street, lane, or place," limiting the protrusion of the datum—the stall-board—to five inches in lanes and narrow streets, and to ten inches in any street being more than 32 feet wide. The prohibition and exception as to projections and protruded shop-fronts are continued in the 14 Geo. III. c. 78, now known in London as the Old Building Act, more in detail than in the earlier Act, and with an alteration of 32 feet into 30 feet as the width of a street which would admit the greater protrusion of shop-front. Hence it appears that an ill-judged concession to the shop-keeping citizens in the time of Charles II. has had the effect of making Cheapside, Ludgate Street, Fleet Street, and the Strand in the older parts, and indeed all the old shop-streets and lanes throughout London, from one to two feet narrower than they would have been if the concession as to the turnover stall-board had not been made, as the shop-front excrescence would, in all probability, otherwise never have been devised.

Weight of Iron Girders.

E. CLARK.

It will be useful to have some simple rules for ascertaining the weight of tubes or beams of wrought iron. The following are on the assumption that one cubic foot of wrought iron equals 480 lbs. First, the sectional area in square inches of any tube, bar, or plate of wrought iron multiplied by 10 will be the weight in pounds per yard of length. Thus, an angle-iron whose section is 3·5 square inches weighs 35 lbs. a yard. In large masses or tubes multiply the sectional area in square inches by the length in feet, and divide by 672 for the weight in tons. To reduce cubic feet into tons multiply by 1½ and divide by 7. A deduction of one-twentieth from these results will give a close approximation for cast iron.

Architects and Gardening.

T. H. WYATT.

I may here be allowed to say a few words on the subject of landscape gardening, a pursuit so enjoyable in itself, and so intimately bound up with our operations, that I am almost inclined to lay exclusive claim to it for the architect; at any rate, I must contend that those who have felt and studied the peculiarities of certain scenery, and have designed buildings to harmonise and group with those features, must be as competent to work out a general *tout-ensemble* as the fashionable landscape gardener who, in his morning ramble, levels wood and hill as with a magic wand, and who will, perhaps, not condescend to consider the character of the house as influencing his decisions. "The picturesque eye is not limited to nature, but ranges through the limits of art—the picture, the statue, and the garden may be equally the objects of its attention." It does not, therefore, follow (as some imagine) that from the architect's intercourse with works where proportion and order and regularity are essentials, our ideas on picturesque effect must necessarily be warped; taste is intuitive, and may be as judiciously and picturesquely applied by the architect in working out and bringing together the beauties of nature in the park or garden, as in proportioning and adjusting those of art in the portico or tower. I know no education that will give taste where none is inherent. Neither rule nor axiom will carry you through her varied bearings, and I cannot help thinking that he who has a natural love for scenery, who has studied the various effects of light and shade, of distances and of contrasts, and who has, to a sufficient extent, the power of embodying in his own mind the effect of contemplated alterations, and, in the mental eye, to judge accurately of the results, is as well qualified to garden a landscape as a Repton or a Gilpin. I have made it a point, in cases where I have been employed in the country, to be indulged with the general arrangement of the adjoining grounds, considering it so intimately connected with the spirit of the design, and so gratifying an occupation in itself. The architect need not be deterred by the want of practical knowledge as to the species or growth of trees, &c.; it

seldom happens that the head gardener of any establishment where such occupation would probably be required is not qualified to render you every assistance in practically working out your ideas and intentions. If we bear in mind this undoubted fact, that "simplicity and variety are equally sources of the sublime as of the beautiful," we shall seldom err. The fault of some scenes that have passed through the ordeal of landscape gardening is, that there remains either an affected simplicity, or that nature has in the generosity of her doctor been sadly surfeited. Hill and dale, wood, water, rock, and heath are unceremoniously jumbled together, without thought of harmony or consistency.

> If thy skill should fail to people well
> Thy landscape, leave it desert,

was the advice of one considered a good authority on these matters; it certainly is a safe one.

Brickwork in London.

J. Turner.

During the reigns of Mary and Elizabeth (1553-1558) the ornaments of Roman architecture were frequently introduced in brick, or baked clay, which laced the fronts of houses and covered the shafts of chimneys, and continued in numerous fantastical shapes until the reign of James I. (1603). Shortly after they were laid aside. In this and the preceding reign the walling was very bad, being mere rubbish, or even turf or peat between two thin shells of brick. Inigo Jones introduced a better method, of which the piers in Lincoln's Inn Fields are an excellent specimen; and Sir Richard Crispe, the patriotic friend of Charles I., is said to have been the inventor of the art of making them as now practised. "In the year 1587," says Fuller, "began beautiful buildings in England, as to the generality thereof—whose homes were but homely before are now most regular pieces of architecture." The method adopted principally in these ages of building with brick was in what we term now "English bond," which was certainly well understood, and many durable examples of which still continue to adorn this country; but about the time of James, and for a long period after, a very careless method of erecting walls with brick began and continued; and although much is attributed to its perfection in the days of Inigo Jones, it does not appear, upon examination of several old buildings, that it was thoroughly understood and appreciated until some years after, when its peculiar advantages over wood, a very common method of building, began to present itself to the Government of James I.; and accordingly we find a proclamation by him, March 1, 1605, forbidding all increase of all new buildings within the city and one mile thereof, and likewise commanding all persons henceforth to build with either brick or stone; and another, October 10, 1607, to the same purpose, when it appears that some were censured in the Star Chamber for building contrary to the tenor of the proclamation; and again in 1614 all commissioners were required to proceed with strictness against offenders in this sort, "for from this time," says Stowe, "began the new reformation in building." But it was not until after the Great Fire of London that it attained universal adoption; and to the age of Sir Christopher Wren and his immediate successors must we feel indebted for some of the finest specimens, as far as regards neatness of workmanship, of which the entrance to the Middle Temple and several fronts of houses about the City and West-end of the town are excellent examples, when the method styled Flemish Bond was introduced.

Greek Architecture in France.

Albert Lenoir.

The Phoceans, as is shown by the remains preserved in the Museum of Marseilles, brought into Gaul the elements of Asiatic art, which they used with taste. In 1773 M. Grosson, an inhabitant of that city, published a quarto volume, in which are engravings of many ancient monuments, found within the boundaries of the old colony. Notwithstanding the mediocrity of the representations, we can easily recognise on some of the tombs, decorated with bas-reliefs and inscriptions, how completely they had succeeded in imparting a Classic taste. The crowns of olive leaves and wreaths of flowers and foliage boast the same elegance as on the coasts of Attica or the Peloponnesus, Caria or Ionia. On the borders of the territory of the Greek colony, in a place called Le Bas Vernègues, near the Pont Royal, on the road from Aix to Lambesc, is to be seen a temple of the Corinthian order, evidently of a Greek character, both as regards its general composition and the style of its mouldings and ornaments, as may be judged by the following engraving. The capital is decorated with sharp cut leaves, like those still to be seen at Athens and on the coasts of Asia Minor. It reminds us of the foliage used in the decoration of the capitals of Pompeii, sculptured in the Hellenic school. In the temple of Vernègues, the bases of the columns, the mouldings of the pedestal, and the proportions of the architraves have evidently been designed and executed by Greeks. The influence of the Asiatic colony was not limited to the bounds of the Marseillese territory, but was felt throughout Gaul, and thus it is we find at Vienne in Dauphiny, and at St. Remy-en-Provence, the ancient Glanum, traces of Oriental art, as readily to be recognised there as in the fragments of the Phocean metropolis. When Gaul came under the power of the Romans the Greek spirit still survived, as we may see in the case of the two cities just mentioned. At Vienne the capitals of the temple of Augustus and Livia were executed on the Greek plan, as may be ascertained by the finely-executed sharp leaves, and in the Museum of Vienne, formed in the cella of the temple may be recognised more than one fragment which shows the Greek chisel. The triumphal arch at Orange is a monument cotemporary with the first victories of the Romans in southern Gaul. In it we trace something Greek, every detail serving to remind us, in some degree, of that school. The composition of the mouldings of the entablature, and particularly those at the top of the architrave, bring to mind the profiles seen in the ancient edifices of Asia Minor. A cavetto is seen surmounting a line of ova, reposing on a string of pearls, a detail completely Ionian. The modillions decorating the principal cornice of the arch have a remarkable peculiarity which is met with in the octagonal monument at Athens called the Tower of the Winds, and reproduced in the Maison Carrée at Nîmes—an edifice of a later date than that on which we are now treating. These modillions are sculptured in an inverse way from those which decorate all the ancient entablatures; the larger part, instead of resting against the cornice so as to form a console, is, on the contrary, near the outer edge of the corona—a very rational arrangement if we consider this part of the decoration as being derived from a wood building, and as the expression of the pendent extremities of the rafters supporting the tiles. The resemblance between this entablature at Orange and the Athenian edifice, which, as it is described by Vitruvius, must be of ancient date, comes in confirmation of the influence exercised by Greece on architecture and its details in southern Gaul. A specimen of the Greek palmetto is to be found in the midst of the foliage of the upper ogee of the impost of the arch at Orange. The coffers decorating the arches are executed with more delicacy than in any Italian monuments, particularly in the double arches, where we observe a happy arrangement which adds to the finish of the execution. In general, the Roman monuments of southern France show in their ornamentation a lightness of touch which may be attributed to the Greek school as introduced by the Phocean colony.

St. George's, Bloomsbury.

W. H. Leeds.

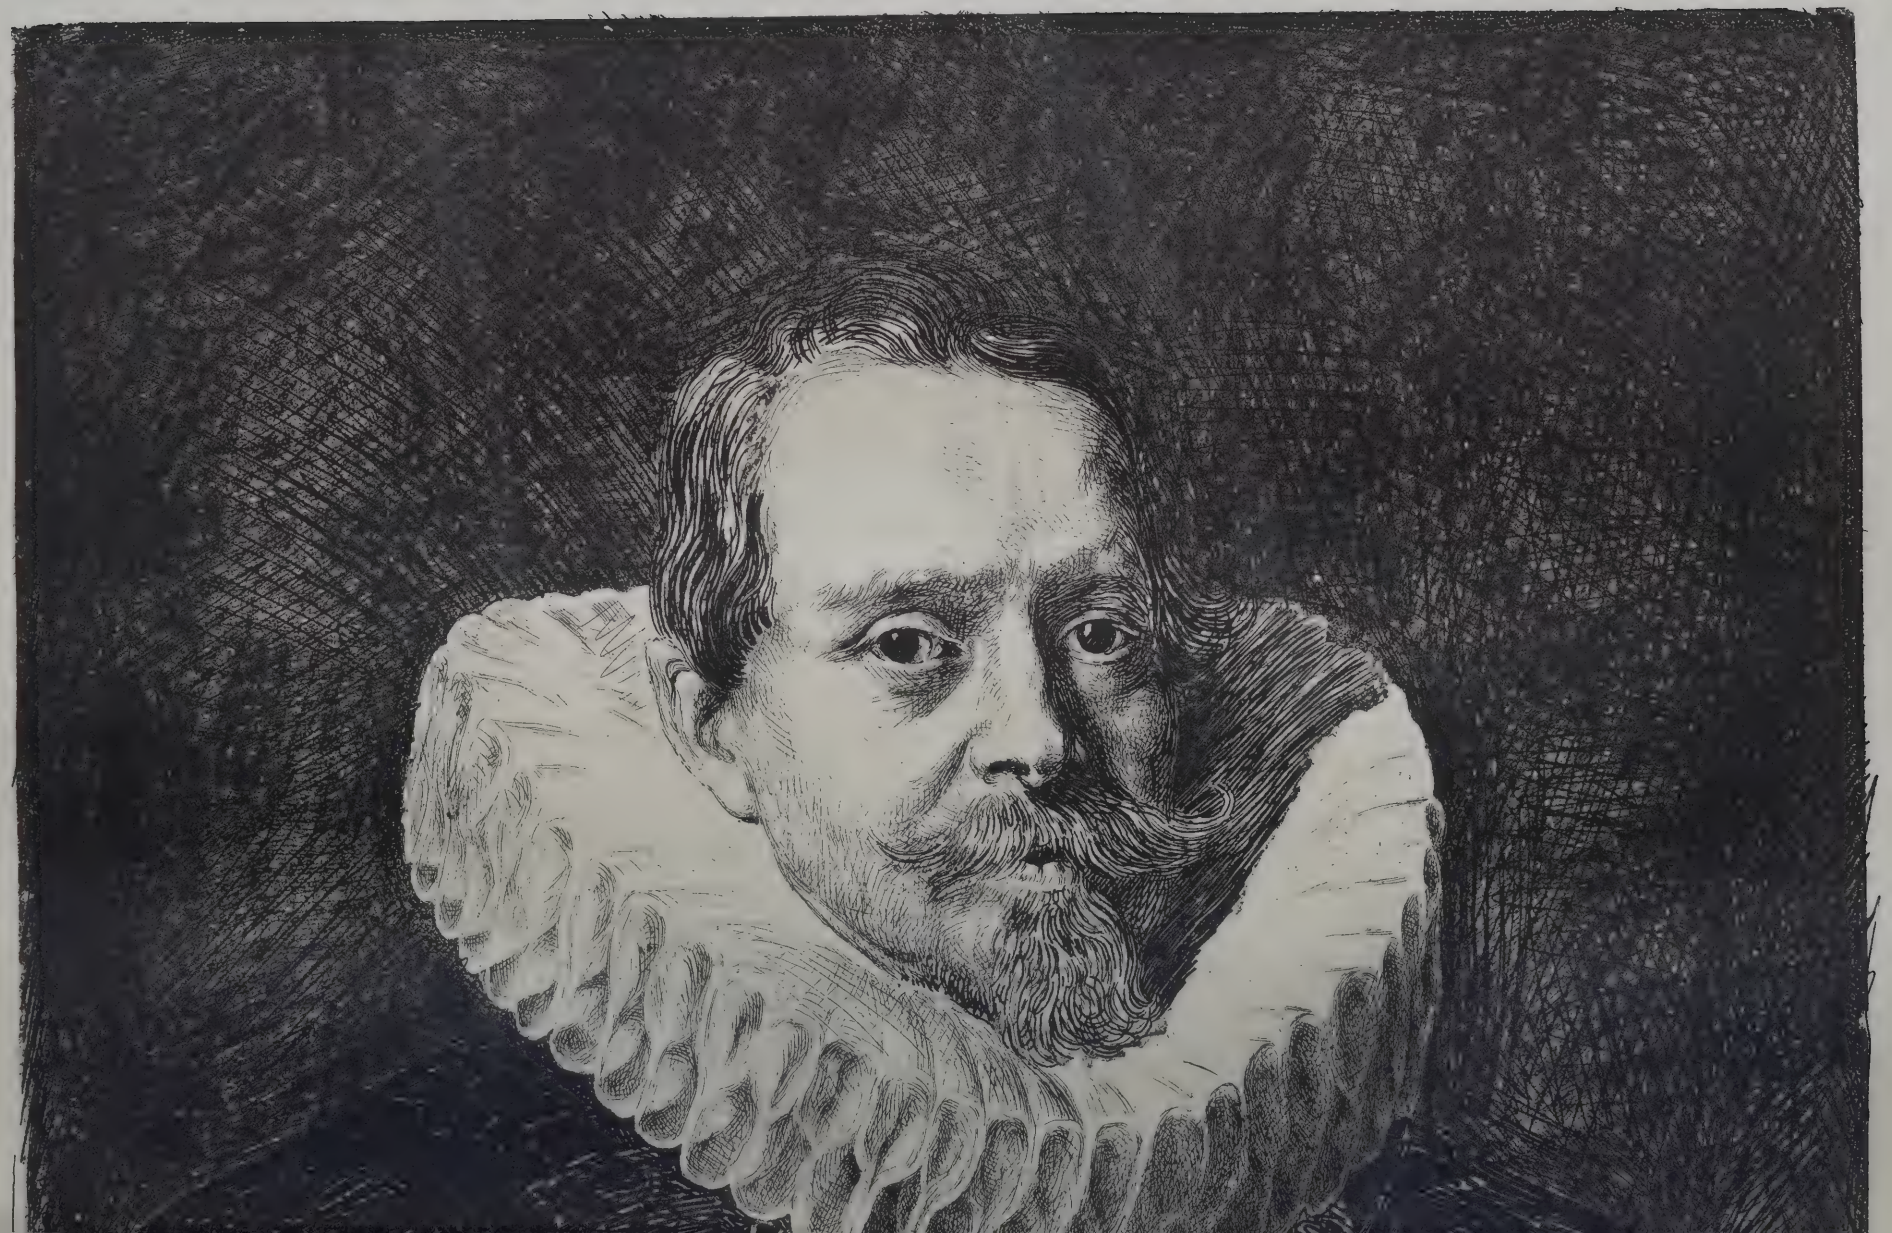
When he was paying a tribute to the artistic talent of Vanbrugh—an architect gifted, if not with taste, with real conceptive power, and that in a prosaic age—Reynolds might very properly have thrown out a compliment to Hawksmoor, and quoted the campanile of St. George's, Bloomsbury, as a most strikingly happy composition, one on which the eye of a painter cannot but rest with delight. Happy as it is in itself, that masterly production has been made a martyr, not to criticism, but to stupid ridicule. Had he possessed aught of critical faculty, it would have enabled Walpole to perceive how beautifully the statue poses upon, how admirably it completes, and how essential it is to the artistic completion of the *ensemble*. It is not an artistic statue elevated to such a height that the personality it is intended to figure to us is utterly lost—nor is it hoisted on a pedestal of its own, clapped upon the top-heavy capital of an overgrown column—a truly unhappy combination, productive of the most harsh abruptness of outline at the general summit. Here, on the contrary, the statue is incorporated with the architectural mass, of which it is the efflorescence, springing out of it as its finial or acroterion, and continuing to a point the lines of the obelisk-shaped part of the structure which it crowns. In regard to that stupidly calumniated church there is another curious fatality, for no one has ever bestowed even so much as a syllable upon its north façade. Indeed, it may be fairly questioned whether it is yet known to exist, for of the thousands who pass the portico, scarcely one, perhaps, suspects that the other side of the building shows a piece of architecture of no ordinary merit — certainly one marked by no ordinary degree of architectural energy, and so far affording an excellent and much-needed study. In the windows of all Wren's churches there is scarcely any reveal; in Vanbrugh's and Hawksmoor's buildings, great depth of reveal—a difference that does not show itself in geometrical elevation, but which is an exceedingly important and influential one in perspective effect—consequently, in the buildings themselves, for while the former mode is attended by the insipidity arising from the absence of boldly defining statues and of corresponding lights on the opposite sides of the apertures, the other secures them. Besides which, we are impressed in the one case with the disagreeable idea of the walls being universally thin, while, in the other, we at once perceive that they are unusually thick and substantial.

NOTES AND COMMENTS.

MR. MATTHEW ARNOLD, in his report on "Certain Points connected with Elementary Education in Germany, Switzerland, and France" (a Parliamentary paper which everyone who takes an interest in education should possess), says that, in general, everywhere now in towns in Germany, Switzerland, and France the school buildings were spacious and handsome. In staircases, landings, and corridors they had the advantage of ours; in England, he says, it seems impossible to an architect not to pinch his staircases and his passages. Mr. ARNOLD supposes it would be admitted that in sanitary arrangements England is still ahead of the Continent; but the improvement in respect of these since his last visit struck him very much in the foreign schools, particularly in France. Certainly ventilation is more cared for with us, and it is more the habit to open windows; at Hamburg, however, he observed more attention than anywhere else to the state of the air in the schoolroom. The Hamburg schoolrooms, too, were always so arranged that the light came from the left to the children as they sat at work.

ON Wednesday Dr. TAAFFE read a paper at the Congress of the British Medical Association at Brighton, in which he spoke of the advantages gained by the introduction of smoke-consuming grates. The money saved by economy of fuel would soon, he said, cover the expense incurred by the changes, and the new grates might be held to be fixtures, to be transferred from tenant to tenant at a valuation. It is worthy of note that the fires in the underfed grates are always bright at the top, which adds greatly to their cheerful appearance, and to the amount of heat given out. It is to be hoped that the day is not far distant when we shall be able to have our rooms lighted by the electric light, with all the advantages of breathing air free from the deleterious products of combustion of gas, and having the walls and ceilings of our rooms free from the blackness of smoke; but until this happy time arrives we ought to take advantage of any means we can command to remedy, as far as possible, the evils arising from the burning of gas in our homes.

THE large house belonging to the Princess DE CHIMAY on the Quai Voltaire, Paris, was purchased lately for the purpose of enlarging the Ecole des Beaux-Arts. The house is in a great measure modern—a part dates from 1860—and it has been resolved not to interfere with the main walls. The work which is now in hand is the transformation of the interior into galleries and classrooms. It is not expected that the work can be completed before the end of December, and as the interior will have to be decorated, the addition to the school is not likely to be utilised before the expiration of a year.



A COMMISSION has been formed to organise the department of contemporary and retrospective art, which will form a part of the Paris exhibition of 1889. M. BAILLY, the president of the principal Society of French Architects, and M. QUESTEL, the ex-president, will represent architecture. The painters are M. BOUGUEREAU, M. BONNAT, and M. CABANEL; the sculptors, M. GUILLAUME and M. MOREAU; and the engravers, M. HÉDOUIN, M. GAILLARD, and M. CHAPLAIN. In addition there are writers on art, and members of the Academies of Fine Arts and Inscriptions. The Baron ALPHONSE DE ROTHSCHILD is the representative amateur.

THERE has been some letter-writing in the *Times* about the title of RUBENS'S charming portrait in the National Gallery, the question involved being whether it should be called *Chapeau de Poil* or *Chapeau de Paille*—that is to say, felt hat or straw hat. According to the history of the picture furnished by M. DE NODUWEZ, both titles are applicable. The subject of the picture is a Baroness DE LUNDEN, who was much admired by RUBENS, but she always refused to sit to him for her portrait. At last he contrived to paint it unobserved while she was gardening. Mdlle. DE LUNDEN wore a straw hat at the time. The picture was afterwards presented to her. On the death of the lady, RUBENS, who had hoped that one day she might be his wife, begged the portrait, promising to give in exchange one more worthy of the subject. In the second portrait, which is now in Trafalgar Square, he substituted a felt hat, but the family always called it by the title of the earlier portrait. The *Chapeau de Paille* was sold to M. VAN NIEWENHUYSEN, in 1822, for 89,000 florins. Afterwards it was purchased by the late Sir ROBERT PEEL, and it finally passed from his collection to the National Gallery.

IT may not be generally known that by an Act lately passed in the American Legislature any person, such as a mechanic or labourer, who, with consent of the owner or contractor performs labour or furnishes materials in erecting, altering, or repairing any building or structure, may have a lien upon the premises for the value of such labour or materials to an amount not exceeding the agreed price or the value of such labour and materials remaining unpaid at the time of filing the lien. Notice of lien must be filed within ninety days after completion of the work; the lien continues for one year only, unless within that time an action to enforce it is commenced, and notice of pendency filed or other proceedings taken according to the statute. The object of the Act is apparently to aid co-operative enterprise among workmen.

THE building trade in Dresden is at present in a prosperous state, as, a great architectural transformation of part of the city having recently been commenced, the local operatives have certainties of employment sufficient to compensate any slackness in their regular avocations. The various allied branches are, of course, sharers in the good fortune. Wages have risen, and the extensions, largely voted by the Landtag, of the auxiliary railway net, guarantee further openings for displaced industrial hands.

ACCORDING to a paper published as an appendix to the English representative's report from Mexico, the city of Puebla is exceptionally well endowed with building materials. From an inexhaustible quarry on the hill of Guadaloupe, in the neighbourhood, have come the pavements, houses, palaces, churches, and other great or large edifices in adjacent towns. This stone is dark and of a very fine grain. Further, Puebla has a quarry on the hill of Loreto, from which is taken a soft stone called "xalnenen," used in building. There is the "kaolin," which supplies the factories of Puebla, where are manufactured the tiles and that ware known as "talanera." There is a very fine clay for red earthenware and brick, which supplies the potteries in the suburb of La Luz and the eighty-nine kilns for making the Roblano brick, which is known to have the consistency of stone; and the greater part of the plain on which the city is built is of a calcareous nature. There is abundance of chalk, or marl, for making lime, and this is manufactured in more than sixty kilns, which run the year round. There is also another quarry at a league's distance, whence comes in great abundance the stone called "chiluca" in the capital. From the river called Tetlaxcuafar, which traverses the city, and from the full-flowing Atoyac, half a league away, is taken gravel in abundance, and divers sorts of sand for building purposes. Three leagues off plenty of iron is found, and a large foundry is kept running, there being others for bronze in Puebla. The neighbouring mountains of Ualintze, of Tepenene, and Tepozuchitl furnish the town with wood and some charcoal. At a distance of 7 leagues are the mountains of Tekali and Tepeaca, which consist entirely of translucent marble, fine and vari-coloured, which is called "Mexican onyx," as well as other solid marbles used for pavements. These mountains of marble would suffice to build a hundred cities of the size of London, Paris, Pekin, Vienna, or New York, without including in the calculation the mountains of transparent marble of Tecuantitlan, in the district of Acatlan, whose territory covers 70 square leagues of stone-fields of divers marbles. The city of Puebla, instead of being built of dark granite, might consist of buildings of transparent marble—a city unique on the continent: it certainly has the material near at hand.

ARCHITECTS' CERTIFICATES.

AN ingenious attempt to override an architect's certificate was made during the hearing of a case at the Birmingham Assizes on Tuesday. The plaintiffs, William Smith and Thomas White, of West Bromwich, builders, claimed from the defendant, Herbert Ault, of Birmingham Road, West Bromwich, whitesmith, 169*l.*, balance of amount due on a building contract. The plaintiffs contracted to build two houses at West Bromwich for the defendant. The contract was entered into on August 4, 1885, and a clause in the contract was to the effect that if the work was not completed by December 1885, 2*l.* per week was to be paid as a fine for every week that elapsed thereafter. The buildings were not finished until March 1886, and on the 26th of that month the architect made an inspection of them, and certified them completed. A counterclaim for 300*l.*, in respect of breach of contract was raised, on the ground of defective work and delaying the completion of the contract.

Mr. Jelf, for defendant, contended that the architect's certificate was not sufficient to entitle the plaintiffs to the amount claimed, inasmuch as the contract was worded so as to make the satisfaction of the defendant, as well as the approval of the architect, a necessary condition of the payment of the instalments. Mr. Jelf relied upon the existence of the copulative "and" in the contract between the statement of these two conditions as evidence that both were intended to be complied with, instead of, as was usually the case, the architect's certificate being considered evidence of the satisfaction of the person employing the contractor. His lordship overruled Mr. Jelf's contention.

Another allegation made on the part of the defendant was that the extra work done by the plaintiffs was not authorised by a written order by the defendant. His lordship said that in that case the plaintiffs were not entitled to recover under the contract, though they might perhaps be able to give evidence of a special contract with regard to these portions of the work. The parties, at the suggestion of the judge, consulted with the view of arriving at a settlement, but at length decided to go on with the case.

Evidence was given by the plaintiff, William Smith, and by the architect, who, in examination, denied that the work had been executed in a faulty manner. It was said that the houses were not weather-proof, but he examined them after a storm, and failed to find any trace of the leakage that was said to have existed in the roof and window-sashes.

After the case had proceeded for some time, the parties agreed to withdraw it and refer the dispute to a professional man.

HISTORICAL ST. PETERSBURG.

SOME interesting articles are being published in the *Novosti* regarding the historical sites and monuments of St. Petersburg, from which we make the following extracts :—At the beginning of the last century the Fontanka was a little rivulet deriving its name from the fountains of the Summer Garden, which it supplied with water. The Empress Elizabeth had it cleared, widened, and banked in with planks, which Catherine II. replaced with granite in 1780. Peter the Great had made free gift of the adjoining land to his favourites, on condition of their building suitable mansions. Many of these were, indeed, handsome and surrounded by extensive gardens ; but until the middle of this century the locality retained a suburban character. The construction of the Fontanka Quay was due to General Baur, who lived in a house at the junction of the Neva and the Fontanka, near the Bridge of the Bleachers ; it is still called Baur House, and is occupied by Court servants. On the site of the present Polytechnique Museum Peter the Great established a private dockyard for the building of ships on the newest models but of reduced dimensions, large numbers of which he presented, with adequate crews, to persons of quality, that they might learn the art of navigation. To habituate the citizens to nautical practices the modern Romulus decreed that aquatic promenades should be held every Sunday on the Neva.

On the spot where the Engineers' Palace now stands, at the confluence of the Moika and the Fontanka, there was a wooden palace on stone foundations which was destroyed in 1797. It was in this palace that Paul was born and passed his childhood, and his mother Catherine II. at first resided after her accession to the throne. Not far from the church of St. Simeon, on the Mokhovaia, a large space of ground was set apart for the purposes of a zoological garden, but the collection of animals was very poor for a long time. The ancient Simeon bridge was situated lower down than the existing edifice. Opposite to it stood the oldest house built on the Fontanka banks ; it belonged to Count Scheremetief. The chapel attached to it was consecrated in 1733, and is considered by reason of its rich images and decorations the most beautiful private church in the city. Close at hand stands the Catherine Institute, originally a palace destined by Peter the Great for the use of his daughter, the Grand Duchess Anne Petrovna, but never occupied by her. On the opposite bank of the river rose the vast mansion of Dmitri Naryschkine, Master of the Hunt, celebrated for its fine picture-gallery and noble suite of salons. In 1834 the nobility of St. Petersburg gave a magnificent *fête* within its walls in honour of the coming of age of the heir apparent, who afterwards became the unfortunate Alexander II. The Anitchkov bridge was constructed in 1715 ; eleven years later it was transformed into a drawbridge which no one was permitted to cross without producing a passport in due form. Not only this bridge but all the streets were guarded at their extremities by pickets of soldiers who stopped all circulation after nightfall. Exception to this rule was made in favour of physicians, priests, officials, and imperial servants, on condition that they carried a lighted lantern. The first historical bridge at St. Petersburg was over the Idanovka and joined the port of Petrovsky to the town. Catherine II. reconstructed the Anitchkov Bridge in stone, embellished it with four towers 20 feet in height, and lighted it with eight lamps. Near it stood the dwelling of Tatistchev, minister and historiographer, and close by upon the Nevski Prospect was to be seen a triumphal arch surmounted by a statue of Anne Ivanovna in Imperial robes ; it was erected on her elevation to the throne in 1732. Among the houses facing the Fontanka there is one which belonged under the reign of Catherine II. to the Minister Glebov, and it still bears his name. In the time of the Emperor Paul it formed a barracks, at first for two squadrons of the Horse Guards, and subsequently for the regiments of Moscow and Lithuania. One of the trophies treasured in its chapel was the bâton of a drum-major taken from the Grand Vizier in the Turkish war of 1829. Near this spot dwelt in the days of the Empress Anne the chief of the secret chancellerie, that Ouschakov whose sinister exploits form one of the darkest pages in the history of Biren.

DURSLEY CHURCH, GLOUCESTERSHIRE.

THE members of the Bristol and Gloucestershire Archæological Society visited the village of Dursley and the neighbourhood last week. The Rev. Canon Madan read a paper on the history of the parish church. Extracts were introduced from the parish registers, which extend from 1566 to 1805. The oldest and most interesting register was, however, missing. It had been lent to Mr. Blunt when he was writing the history of the church in 1877, and it was uncertain whether it was returned or not. He read quotations from Mr. Blunt's book, from which it appeared that the Archdeaconry of Gloucester had been long connected with the rectory of Dursley, and they continued attached until 1865. The original church was not so large as the present structure, and the western tower was surmounted by a spire. The two larger aisles were built in connection with chantry chapels which occupied the ends. The south chantry was known as the foundation of Thomas Tanner, or as Tanner's Chapel. This was perhaps the most interesting portion of the church. Mr. Blunt said the oldest portion dated from the fourteenth century. The tower of the church was not built centrally with the nave, it standing to the south of the central line. The church was rebuilt in 1707, but there was no reason for supposing that it was built upon any other than the foundations of the original. It did not appear that there ever was any chancel arch. The extension of the chancel westward was only marked by the projecting stonework, and by the roof of the old chancel, which was of higher pitch than the nave by 5 feet or 6 feet. The head of the effigy in Tanner's Chapel was missing. Under where the head was, an inscribed piece of lead was found bearing the date 1789. He read extracts from the registers showing expenditure for bells, repairs, &c. In 1688 the safety of the tower was suspected, and some timber was bought for 30*s.* to prop it up, but in 1699 the tower and spire fell, happily outwards, and not on the church to any great extent. Bigland, writing in 1791, said the spire fell while the bells were ringing, and several lost their lives by the accident. In March in the same year, the inhabitants petitioned King William to grant

letters patent to ask for collections through the kingdom towards the great charge and pious work of rebuilding the church. These were declined, and nothing was done for several years; but when bountiful Queen Anne came to the throne, the parishioners gave her credit for a more tender heart, and applied for the permission with better success. Some 509*l.* was obtained towards the required 2,000*l.*, but the careful parishioners cut their coat according to their cloth, and contented themselves with a tower only, without a spire. After paying for this and a bell, clock, and chimes, a balance remained of 5*s.* 9*d.*, which the churchwardens appear to have put into their own pockets. Several other extracts from the churchwardens' registers were read by Canon Madan. From these it appeared that in 1639 a new ring of bells was cast out of the old ones on the spot, the tower being temporarily turned into a bell foundry. In about 1774, the tenor bell being cracked, was recast by Rudhall for 49*l.* 7*s.*, and a new set of wheels, &c., were put up. The present bells, numbering eight, were inscribed "Mears, London, 1824" There was a tradition that at one time there was a public right of way through the church from north to south, to enable people the more readily to fetch water from the Broadwell. The chancel was rebuilt in 1738, the same year in which the Market-house was built. Canon Madan said in the restoration of the church which had been carried out since he had been rector, every effort had been made to preserve all the points about it which would be interesting to the archæologist, consistent with the necessary improvement of the building. In 1817 a gallery was constructed across the church from north to south. In 1828 the churchwardens paid 1*s.* 3*d.* for the carriage of a marble basin for a font from Bristol. In 1829 there was a curious entry of a charge for an oak font, the churchwarden having placed the old stone font in his field for use as a horse trough, no doubt thinking he was entitled to it in exchange for the marble basin he had obtained. The old font was afterwards discovered, repaired, and restored, and re-erected on a new base and placed on the north side of the central passage. At the last restoration in 1866 it was removed to the south aisle. In 1832 the church was repewed, at which time the whole church was appropriated except twelve or fourteen double pews, where kneeling was almost impossible. The pulpit was the usual "three-decker" then in vogue, but it was not long lived. Canon Madan gave a number of details connected with the history of the church, and the improvements which had been made in it.

THE ARCHÆOLOGY OF CHESHIRE.*

BY HIS GRACE THE DUKE OF WESTMINSTER, K.G.

IT is my privilege as Lord-Lieutenant of the County Palatine to welcome to the ancient city of Chester the Royal Archæological Institute of Great Britain. The associations of this city in which we are assembled, the "heir of all the ages" as we regard it, remind us that archæology, "the science of past time," is, after all, a comparative term; for, though we can carry back our history for several centuries, such antiquity is comparatively modern by the side of the antiquity of Egypt, Assyria, and China, which were at the pinnacle of greatness when the Roman power was yet in the womb of time. It is not my purpose in this address to enlarge upon the value and importance of archæological study, the position it should hold in a well-planned system of liberal education, its relation to historical study, the light it throws upon the past ages, the bearing it has upon politics, which appear so essentially a science of the present time, though a moment's thought will suffice to show that the present cannot be dissociated from the past out of which it has grown, and that the study of the past can at least teach us what to avoid, if we cannot always find something to admire and imitate. Archæology has been often the subject of some pleasantry, because at times its too ardent students have given rein to their speculative genius in the region of the absolutely unknown. There is, however, abundance of work, interesting and valuable, in seeking to establish accuracy about facts supposed to belong to the region of the known, and in discussing the conclusions drawn from those facts in the light afforded by recent discoveries. This we may do with advantage as regards Chester, which is very much more than a mere name. A glance back over the facts known of the history of this old city shows how important a place it was, as might be expected from its commanding position, and what stirring scenes it has witnessed during the last nineteen centuries.

We are told how, so early as A.D. 43 and 48, it had its share in the military arrangements of the Roman commanders Aulus Plautius and Ostorius Scapula—how it was the *point d'appui* of Suetonius in his expedition against the Druids of Anglesey—the headquarters of the Victorious Legion, the legion whose vexillarii took an important part in the defeat of Boadicea, the brave British Queen. We know that while Jerusalem, the Holy City, was being besieged and destroyed (A.D. 70), Chester streets resounded with the tramp of Roman legions; that tribute was being brought from the conquered British tribes, some never reaching the Roman treasury, but sinking on its way thither to the bottom of the river, only to be found some 1,800 years afterwards, like the pig of lead discovered the other day by the gasworks at Chester, the exact counterpart of that preserved at Eaton, and stamped with the date of the Emperor Vespasian, and with the name of the tribe Ceangi, whose tribute it was. Our archæological friends find traces of this occupation, not only in the name Chester, Castra, the camp *par excellence* (the Welsh called it Caer Lleon Vawr—*i.e.*, the camp of the Great Legion), but also in the arrangement of the streets. St. Peter's is on the site of the Prætorium. The inscribed altars which have been dug up, the hypocaust, the crocks of coins, the great roads leading to and from the city which, in a manner so characteristic of those who constructed them, still strike like arrows over hill and plain, unswervingly and perseveringly, to their point.

I might be expected to have added to this list of the relics of Roman occupation the Walls. We shall hope to hear this week some authoritative opinion on the question of the Walls—how far they are Roman. The city must have had some walls. But do any traces of those Roman walls remain, and are they to be found *in situ*? We shall hope to hear from our learned visitors about the Ceangi, whose home comprised three of the North Welsh counties, Carnarvon, Denbigh, and Flint; about the long dark period (476–900) which followed when the Roman occupation ended, and the 20th Legion and others were withdrawn finally from Britain because of the troubles near at home. Was that withdrawal (the end of the military occupation) an advantage to this country? We imagine not. The strong hand was needed then, if ever. They were troublous times, we may conjecture, from the two or three facts which are known to the ordinary reader (the references to civil war among the several chieftains, and the appeals to the Romans for assistance, "The Groans of the Britains"). Then, again, about the Irish pirates (or Scots, as they were then called) who devastated the western shores. How often must they have come with fire and sword, harrying and carrying! Was there, then, any other connection or traffic with Ireland? Was Chester as important a trading centre in the second century as York is said to have been at that time, when the wines of the Levant, woollens of Asia Minor, the purple of Tyre, the cambric of Cos, the spices of India, the slaves of Africa, the silks of China, were as abundant on the Ouse as they were on the Tiber? What about the laws and institutions after the Roman withdrawal. Were they Roman or Celtic? What was the language spoken? Did the Latin language take any hold upon the country at that time? Was the religion Christian or heathen? Were any left in Britain of those Christian soldier converts to whom St. Paul had preached as a prisoner at Rome?

We come down to the Danish occupation. The desolation when the Danes came on the scene must have been sad and pitiable. Chester was a ruined city in 895, when the Danes, flying before Alfred the Great, took refuge in it, and attempted to defend the place against the king. They soon retreated to North Wales, and left it ruined—they were no restorers. In this ruined state Chester continued until the Amazon Ethelflœda, Alfred's daughter, "Lady of the Mercians" (who built castles at Eddisbury, Runcorn, &c.), restored and beautified it, and repaired the walls, following the line of the Roman fortifications. How far are the existing walls hers, or even of later date?

Some seventy years later (971) we come to a grand epoch in our city's history. Will archæologists come here to tell us that the tale is not true which is so flattering to our pride? Did Edgar, "the Emperor of Britain," make his six or eight feudatory princes (Kenneth, King of Scotland, Malcolm of Cumberland, Macceus of the Isles, and five Welsh princes) row him (as we read in Campbell's "History of British Admirals") up the Dee in a barge to St. John's Church? Again, what have they to tell us of the course of the Dee—was it (as in some old maps) one with the Mersey, and did it cover, near the city walls, a wider area or follow a different channel? What light is thrown by the name Ince (Ynys, Welsh for island) and the claim of the Abbot of St. Werburgh in Edward III.'s reign to the sea?

We come to a better known period—the time of the Norman Conquest. We are proud to remember that Chester stood out to the last—"the one great city"—against the Norman invader, but it was at last taken and given to Hugh Lupus on condition that he should keep the Welsh marauders in check. But even here we have to ask, (1) What are we to believe about the story of Harold's surviving his wounds at the battle of Hastings and spending his remaining days as an anchorite in a cell near St. John's Church? His wife, Algitha, we may remember, was the granddaughter of Leofric, Earl of Mercia, and Lady Godiva, and in this way he had some connection with

* An address delivered on Tuesday at the meeting of the Royal Archæological Institute.

Cheshire. (2) Were the forests which covered so large an extent of Cheshire (not only the great Delamere Forest [of Mara], but that which made Wirral a desolate waste) until they were cleared away by the energetic prudence of Edward III. in his campaign against the Welsh—did these exist in Roman and Saxon times, or were they planted by the forest-loving William? Such a question suggests the difference between the Cheshire of that reign and the Cheshire of to-day. Instead of trim, well-cultivated fields, and pastures for cattle and sheep, and comfortable homesteads, a wild, half-reclaimed country with few habitations, and those few miserably built—a huge forest reaching from above Worcester to meet Delamere—the wild bull and boar, wolf and bear, its dangerous tenants.

Stoutly though Chester resisted William the Conqueror, once brought under Norman rule it became intensely loyal and a strong bulwark of his power. Few places so far distant from the metropolis have been more highly honoured by visits from royal and distinguished persons, or have received more frequent marks of favour than Chester. It was a port when Liverpool was a creek. Pennant speaks of Chester as "a constant rendezvous for troops and *place d'armes* for every expedition on this side." Thus Edward I. visited Chester in 1282–3–4. Here in 1300 he received the final submission of the Welsh. Edward II. in 1312. The Black Prince in 1353 to protect the justices. In 1394 Richard II. selected 2,000 Cheshire archers as his bodyguard.

But loyal as Chester folk were, we must not forget that the population became somewhat mixed. An asylum or sanctuary was established to which felons flocked. So great a nuisance did it become that in Henry IV.'s reign complaint was made to the king of "the many murders, robberies, batteries, and other riot done by the people of the county of Chester to divers of the king's liege people in divers counties of England." Lewis Glyn Cothi, a Welsh bard, describes Chester as "the habitation of the seven deadly sins." We may well congratulate ourselves on the peaceful times of Queen Victoria—thankful that law and order prevail; that the intolerable miseries and sorrows of the poorer classes in these times have been abated, the sense of insecurity removed; that it would not be necessary now to fear, as in 1130, the irruptions of the Welsh, which made Pulford so unpleasant a residence for the monks that they migrated to Dieu Lacresse, or to qualify leases and warranties (as may be seen from deeds in the muniment room at Eaton of the time of Edward II.) with the condition that "peace continued." [The lessee in 1299 was bound to keep up the building *nisi tempore guerre fuerint combusta* (unless they were burnt in time of war); and rents were payable only *tempore pacis*].

The arrangements for the excursions of the members remind me that the present area of Cheshire is much circumscribed. Once a part of the great kingdom of Mercia, ruled at one time by Penda, the champion of heathendom, before whom one Christian king after another had fallen, later by Offa (757–819), on equal terms with Charlemagne, by whom he was styled "the mightiest potentate of the west," then by Edgar, of whom we have spoken, this city could not fail to have been the scene of many battles and sieges. Under the Palatine Earl, if not before, the county included a portion of Wales within its jurisdiction. When, therefore, we visit Rhuddlan Castle, we shall not be going out of the boundaries, if we may say so, of Old Cheshire. Rhuddlan was given by Hugh Lupus to his warlike lieutenant, and in later days was held by a Cheshire knight, Randal, with a motley following of fiddlers and musicians, against Llewelyn and his Welshmen.

Mold, too, which was another dependency of Hugh Lupus, came into unpleasant collision with Chester on more than one occasion. In 1465 it was held by a daring marauder, Reginald Meredyth Griffith, who plundered all who were obnoxious to him, and who made the Chester people the special objects of his unwelcome attention. A number of tradespeople from Chester repaired to Mold fair to dispose of their wares. This was an excellent opportunity for Griffith. A quarrel was raised—swords were out at once—blood spilt. Griffith captured the worthy Mayor of Chester, Robert Browne, who had attended the fair as a draper. Mr. Browne paid the penalty for his fellow-citizens. Hurried up to the Tower after the fight, he was hanged without ceremony on an iron staple fixed in the ceiling of the great wall. Shortly afterwards an attempt was made by Chester men to avenge this murder. Two hundred stout and active men left Chester, but they were entrapped into Griffith's house, which he himself set on fire, and they were all but a few killed without mercy. Such were the relations between Chester and Mold in 1465. Our proposed visit will be much more peaceable. If we carry back anything, it will be, I hope, some voluntary offering for the museum which was opened yesterday.

We have succeeded at last in raising a commodious building, which will be most useful as a receptacle for curiosities and antiquities connected with the district which might otherwise be lost. Architecturally it will be a handsome addition to our public buildings, and if the well-considered designs of the committee in connection with the teaching of science and art in their various branches are carried out, it will enable Chester to take a high position as an educational centre, and thereby confer a great benefit upon an extensive district.

I have said nothing in this address about the ecclesiastical or the literary history of the city, the Mystery Plays of Higden, the names of the eminent and famous men who have been born in the county—Chancellor Egerton, Prynne, Bradshaw, and Jeffreys. But may I refer to the able work on "Roman Cheshire" which is being brought out by Mr. Thompson Watkin, author of "Roman Lancashire," and which promises to be a valuable supplement to the standard works of Ormerod, Earwaker, and Baines, and the useful pamphlet on "Inscribed Stones" brought out by Mr. Williams. I will conclude by repeating the cordial welcome which it gives me great pleasure to offer to the members of the Archæological Institute on behalf of the county of Chester, and to assure them that we shall look with interest for the instructive papers which they are doubtless prepared to read before us.

Bygones.

"*Antiquity after a time has the grace of novelty.*"—Hazlitt.

SAMUEL BEAZLEY ON GOTHIC ARCHITECTURE.

THE paper on "The Rise and Progress of Gothic Architecture" which was read by Samuel Beazley, jun., at the meeting of the London Architectural Society on December 12, 1806, has a sort of historical interest, for it is about the earliest evidence of a change in the feeling that prevailed among architects in respect of Mediæval work. Up to the close of the eighteenth century Gothic was under a cloud, but, thanks to Warton, Milner, Britton, and Dallaway, it was able to emerge to some extent from the prejudice which overwhelmed it. The appearance of the "Lay of the Last Minstrel" in the bookshops was the sign of a new era for the style. Scott was able to move people to feel for Gothic ruins as if they were forms which at one time were living and glorious as the Douglas himself. In Beazley's essay, which was written in the year after the publication of the poem, we can observe the alteration in sentiment. In his own practice he did not seem to have cared much about Gothic, for his theatres and railway stations show that he preferred Italian models. The essay is therefore the more remarkable, as the author might with reason be supposed to have a prejudice against a style which he was not wishful to adopt.

The struggle which was then in progress among men who hitherto had believed only in Classicism is seen in an essay by Mr. Edmond Aikin, which was read at an earlier meeting of the Architectural Society. It is evidently the work of a man who was trying to oppose the new ideas in his own mind by maintaining that the impressiveness of Gothic was due to all kinds of ruses. The conclusion Mr. Aikin came to was as follows:—

"Considering the Gothic mode in a general view, we find a system of bold and ingenious construction, producing a grand, consistent, and admirable style of architecture; but this praise cannot be extended to the details and ornamental parts. The arch, as it is the element of construction, is made the foundation of decoration, and repeated in various forms and proportions to a most unmeaning excess. The smallest shrine is a miniature of the façade of a cathedral, and the eternal repetition of minute parts and frivolous ornament rather confuses than enriches the effect. It must be allowed that the outside of a cathedral is generally inferior in beauty to the inside, the reverse of which is the case with a Grecian temple. The Gothic style of construction is adapted to produce a grand interior at the expense of the exterior, which frequently presents a huge pile of unconnected parts, picturesque but not beautiful—a forest of buttresses, a collection of extravagant decorations, which spread over every part, leave the eye no repose among the tawdry profusion."

Beazley also was not well able to resist the thought that there was too great profusion of ornament in Mediæval buildings. He had read in Dallaway's book that Gothic architecture might be as clearly and distinctly characterised as the Grecian, that is divided into distinct orders. He could not go so far in respect of a style in which he said so much ornament was mingled, and in which luxuriance of fancy seemed to be the only guide that was ever followed. He promised, however, to recur to the subject, but apparently he was diverted from it. About 1806 there were tougher battles to be fought than those which took place over two old styles. Beazley was among the volunteers who fought under Wellington until the end of the campaign. He had, we believe, the honour to be named in one of the Napoleonic proclamations as a particular enemy of the

cause of the Empire. Before the war was over another man had entered the field, and demonstrated the possibility of dividing Gothic into periods. That was Thomas Rickman, whose dissertation appeared in Smith's "Panorama of Science and Art" in 1812.

It was inevitable that Beazley should at the outset consider the origin of the pointed arch. Some, he said, traced it to the Spaniards; others, to the Italians, and held it to be a corruption of the Grecian and Roman styles; and a few to the Goths. His own notion was that the name was suggested from the irregularity in design, which bore some affinity to the wildness of the Goths as a nation. The grand characteristic of the style is, he said, the pointed arch; and the particular difference in the principles of erection consists in its arch springing directly from the capital of the column, instead of from an horizontal architrave and entablature, and this difference, although it may not appear to have so great a degree of solidity, yet, perhaps, displays much more excellence in the art of construction, both as to the lightness and nicety of the works of the arch and the strength of the pillar supporting it. But with this characteristic there were local varieties.

Each country appears to have a style of Gothic peculiar to itself. Thus, the more northern nations have been distinguished by a redundancy of ornament; in France it was light and simple, while Spain presents nothing to the eye but the gigantic and the massive; and in Italy, again, contrary to all ideas of beauty and propriety, we find circular arcades and porticoes forming a mixture of the two styles, as in the cathedrals of Pisa and Orvieto.

The Saxon churches were, he believed, made to resemble the Roman basilica, but the tower he derived from a different source:—"The appearance of these towers producing such a grand and striking effect, they were adopted in most of the religious buildings erected subsequent to this period. Their first introduction has been, naturally enough, attributed to the invention of bells, which made the addition of a high raised edifice for containing them necessary; but as some of the oldest buildings in Denmark have a sort of wooden tower supported by posts, rising considerably above the other parts of the church, I should rather suppose them to have been introduced by the Danes, who, after their invasion, left us many relics of the architecture of their own country, which were adopted according to the convenience or taste of the Saxons. Thus when I am speaking of the Saxon style I shall always include the Danish innovations of the times as forming a portion of it, whether they are considered as improvements or defects."

Beazley held that at first the Saxons, either from ignorance of decoration or from a natural simplicity of taste, used little or no ornament, while afterwards there is found a profuseness of decoration that appears little analogous to the principles of their style. But the influence of Rome was still to be recognised, especially "in the embattled and triangular frettes, which scarcely differ in form from those so frequently used among the ancients." Norman work resembled Saxon, being always distinguished by the same characteristics, and using in most instances the same ornaments, though perhaps with superior execution, from the circumstance of masons being brought to England from the continent, and the ease with which the Caen stone was worked on account of its softness—a stone to which they were attached from a national partiality, and which they accordingly imported from Normandy to use in most of their buildings in this country. In fact, until just before the last king of the Norman line ascended the throne, not the least deviation from the circular to the pointed arch had taken place. Accident, he considered, gave rise to the change in form:—

"For my part," he says, "I should rather suppose the idea of the pointed arch to have been presented by the accidental intersection of two semicircles, which I believe will be found to give that angle which was used in our earliest instances; and a range of semicircular arches intersecting each other at the church of St. Cross, where the parts between the intersections are alone perforated, seems to corroborate this opinion. These, as well as the whole of the east end of that church, were constructed in 1130, and appear to be the earliest example in this country, and to have given the first idea of the style which has since been called Gothic, and which from this time began to be generally adopted in all the new buildings throughout the kingdom; at first forming little variation from the Saxon and Norman, except in the point of the arch, but by degrees attaining a much greater delicacy and more frequent use of ornament, both in the capitals of the columns and every other part of the building, till, towards the end of the reign of Henry III., about 1272, it appears to have become completely a different style. The short massive column was changed for a cluster of small pillars (sometimes bound together by an ornamented band)—

> To slender shafts of shapely stone,
> By foliag'd tracery combin'd;

part of the projections of the shafts continuing through the capital formed the moulded rib of the light groined arches of the nave."

In the spires Beazley saw a resemblance to the sacred pyramids of Egypt, and he said it was but natural to suppose that they were used as a kind of symbol of the destination of the building, and adopted from the same ideas that led to their erection in Egypt. "I mention Egypt," he goes on to say, "as having been particularly famous for its pyramids; although, in tracing the history of architecture in the East, we shall find that the buildings in every country tended to the pyramidal form, which was first used as having a resemblance to a flame of fire, an element so generally worshipped in the Oriental world; in Persia under the Mithraic devotions, and in Hindostan under the name of Surya."

The carved work in a Gothic building appeared to have most attraction for Beazley, and from the bosses of the vaulting ribs he with some ingenuity derives a refutation of the theory that the arch was suggested by a forest glade. He writes:—"The ornaments that we find used in these groined arches, generally consisting of a grotesque head or one large flower, is, I think, the most conclusive argument against that idea which derives the Gothic church completely from the origin of a grove. For had that been the case it is but natural to suppose that these ribs, which doubtless were intended to form the branches of the trees, would also have resembled their imagined original in its ornaments as well as in its outline; but we seldom, if ever, find that they were in the early examples at all ornamented with foliage, which would certainly have been the most natural decoration for any ceiling intended to imitate the overhanging branches of an avenue of trees."

The roofs of Gothic buildings are not, according to Beazley, to be matched in any other style. Among the forms which were used for decorating them, as well as other parts of the buildings, he distinguishes the quatrefoil and the trefoil, and he considers they must have been derived from something that had a Saracenic origin:—"The grounds upon which I have formed this opinion are, that it does not appear to have been used till some few years after the First Crusade, and that if correctly analysed, it will be found to be merely the connection of three, or of four crescents, joined at the extreme point of the horn. Nor will any person think this conjecture totally without foundation, when he considers the almost constant use of the crescent among the Saracens, both as a sacred symbol and as an ornament in all their works of art, wheresoever it can be introduced with the least degree of propriety. The other principal ornament that we can with any degree of probability trace to the same origin, are those leaves whose outlines so frequently grace the capitals of columns in many of our ancient cathedrals, and which upon a correct and comparative inspection appear to possess a great resemblance to the leaves of plants that grow in Palestine and Arabia, and which were as naturally adopted in those countries for an architectural ornament as the foliage of the acanthus was borrowed by Callimachus to form the beautiful capital that decorates the Corinthian column."

The carving of the statuary might be supposed to be enough to overcome the admiration of a man who was satisfied with the floral ornament. Samuel Beazley appears to have recognised that the figure-sculpture was wrought rather rigidly in order that it might be in keeping with the lines of the building. In the following passage he anticipated much that has since been said on the same subject:—

"When I consider these various instances of their statuary, I can never suppose that author totally divested of prejudice who has chosen to denominate these mitred abbots and other venerable statues of the Gothic style 'monkeys,' and to distinguish the elegant and variegated tracery of their ceilings by the terms of 'gaudy sculpture' and 'trite and busy carvings, which glut the eye rather than gratify and please it with any reasonable satisfaction.' Surely a person criticising with such severity could never have troubled himself to assimilate the sculpture that he condemns with the structure which it was intended to ornament, or had forgotten that there should be an accordance through the whole of the building, and that the decorations should never differ from the general style by which the main body of the construction was characterised. Indeed, when we consider that most of their statues were sculptured from so rude and frangible a material as freestone, we are sometimes surprised at the great effect which they have given to many of their works in this art. . . ."

"Numberless faults have been found, and many errors undoubtedly exist, in Gothic statuary, when compared with the wonderful sculptures in porphyry and alabaster with which those skilful and sublime artists Phidias, Praxiteles, Apelles, and Lysippus adorned the public buildings of ancient Greece. But the fastidious critic whose eye turns with disgust from everything that does not possess the classical beauties and proportions of the antique, and who supposes every figure unworthy of the least admiration which does not, like the statue of the Olympian deity, seem to

> Shake his ambrosial curls, and give the nod,
> The stamp of fate and sanction of the god,

should consider before he indulges in such an illiberal and general condemnation of those which adorn our cathedrals that the refined and polished sculpture of the Greeks, which certainly possesses such just claims to his admiration, would have been as much out of character if placed in the rude niche of a Gothic structure as the half-formed but expressive figures of Aaron, Moses, or the Twelve Apostles would have appeared ridiculous had they obtained situations on any of the elegant pedestals of ancient architecture. A critic in his observation on the ornamental parts of a building should only consider them relatively with the character of the building itself. For though beauty in a great measure depends upon smoothness and just proportion in a single statue, yet in its connection and relative situation in a building, where it becomes a subordinate object, its principal beauty must consist in its coincidence with the general character of the structure in which it is placed; and I believe that no one will ever deny that there are ideas of beauty attached to the preservation of uniformity in the character of any composition, whether of painting or architecture."

We cannot find space to notice our essayist's remarks on tabernacle work, stained glass, wood-carving, &c., and must pass to what is said about the strength of the pointed arch.

"Monsieur Gautier has asserted that the pointed arch is stronger than a semicircle; this assertion is, however, too general, as this is only true in particular cases; that is, when the radius by which it is described exceeds the span in a certain ratio. In all other cases it is weaker, in proportion, as the centres from which it is described approach or recede from the ends of the horizontal line which forms its base. In an able calculation by Dr. Young, at this moment before me, of the equilibrations of the different arches that have been used in our Gothic edifices, it is proved that if the radius of the pointed arch be three-fourths of the span, or forms that arch which is called the sharp arch of the fourth point, the strength of a semicircle will be to the strength of the Gothic arch of the same span as 1,257 to 1,000. And if the radius be two-thirds of the span, or form an arch of the third point, the strength of the semicircle will be to the Gothic arch of equal span as 1,210 to 1,000. From this we see that the Gothic arch, whose radius is equal to the intervals between the pillars, is the weakest; and that, according as the centres from which it is described move on either side in a horizontal line, the strength of the arch increases."

For the proportions of Gothic cathedrals he adopted the theory which is figured in Murphy's book on the church of Batalha, namely, that the standard was the figure of a man. But in a question of this kind much allowance should be made in favour of Samuel Beazley. When the condition of inquiry on the subject at the time is considered—when it is remembered that after eighty years the question is not determined, his defects will then appear trivial. We have printed sufficient extracts to make it clear that so remarkable an essay does not deserve to have fallen into oblivion.

LIVERPOOL ART WORKERS' GUILD.

A MEETING for the purpose of aiding in the development of the Liverpool Art Workers' Guild was held on Tuesday, at the rooms of the Liverpool Architectural Society, Mr. A. T. Squarey in the chair.

The Chairman said he should call upon Mr. Bare to explain the objects of the guild, and he should then invite those present to discuss points of detail as they might desire.

Mr. H. B. Bare said:—I think we may venture to congratulate ourselves upon the progress of domestic decorative art during the last quarter of a century. Mr. William Morris, in lecturing on this subject some time since, said that "twenty-five years ago the public were as blankly ignorant of the history of the art as the designers were of its first principles. The whole subject was treated with general contempt. What individual talent there was could only show itself in eccentricities that deserved to be called by any other name than decoration." Since then we have made some advance from ugliness towards beauty, and it is not now difficult to find in shops all over the country goods at commonplace prices which are intended to be—and are—beautiful, and are more or less marked by artistic individuality, and it is possible for any one who so chooses to make the interior of his house comely and pleasant without any very unreasonable expenditure. There may nowadays be found furniture sensibly designed, combining comfort with elegance of form; fabrics with patterns and dyes which commend themselves to the educated taste; and so on through a variety of manufactures. But I fear we must admit that the general public have very little knowledge of decorative art, and that a few of the upper and middle classes only have learnt that there is such a thing as decorative art, which should be popular art. I had a forcible illustration of this some months ago, when, looking over the pattern books of a leading firm of calico printers, I was assured that the ugly patterns sold quite as well as the undoubtedly pretty ones. Now, if the decorative arts were in a healthy condition, instinctive good taste would shun the ugly patterns and demand the pretty ones, and the manufacturer would be saved what must be considered as a degrading waste of time and money; for what can be more wasteful than using the accumulated knowledge and skill of centuries in spoiling a piece of good white cloth by putting a pattern on it which you know to be ugly? Well, to try and get at the root of the matter, we have to endeavour to interest the whole public in decorative art. We have to instruct ourselves and improve our own taste, and to give greater support and encouragement to the art worker and the manufacturer to produce only that which is commendable. We shall find that we have in our midst ample material to work upon in carrying out such a project, and that the chief thing necessary is some combined effort, so that by association in one body we may be enabled to meet and to mutually assist one another, and to discuss the means best adapted to the beautifying of our homes and surroundings. First, we have an ever-increasing number of people interested in the general subject of domestic decoration, not merely for the sake of mere selfishly luxurious living, but from the growing consciousness that what is done towards elevating and beautifying our home life has a humanising and refining tendency which goes to increase the sum of happiness through all sections of the community. Working in this spirit are some who have devoted themselves very nobly to the task of teaching their poorer brethren the simpler kinds of decorative work which may be undertaken in their homes, and have thus succeeded in planting a new pleasure in the midst of their listless lives, and, moreover, of finding useful and remunerative occupation for the leisure hours of the artisan, who would otherwise have simply wasted the time idly. It is not surprising, however, if to the eye of the artist and professional designer many amateur efforts appear to need directing into a better channel. Here the Liverpool Art Workers' Guild could point the way to improvements in design, and adapt them to varied and varying requirements. The superior quality of work thus obtained would produce a growing demand for it. Other amateurs there are who show good technical skill in various branches of artistic work, such as in wood-carving, metal *repoussé*, painted decoration, needlework, &c., and who do much in this way towards the embellishment of their own homes. Here again may frequently be seen the want of better direction in the style and methods adopted and evidence of a general lack of harmony and consequent waste of effort. In such instances the guild would be in a position to advise and assist by suggesting a decorative scheme, the details of which could be leisurely worked out by the amateur, aided, where necessary, by trained craftsmen for such portions as would be beyond the powers of the amateur to perform. Ladies who are capable of doing needlework up to a good standard of design, or who are willing to undertake to work out special designs prepared by the guild, will have the opportunity of exhibiting and disposing of their work. As has been already announced, there will presently be formed a class for the study of wood-carving, and those who desire to avail themselves of it are invited to send in their names. The amount of subscription to such a class would mainly depend upon the numbers who came forward, and at the earliest possible moment particulars will be issued to those who give in their names. One of the objects of the guild is to establish a collection of good examples of design and workmanship, including the following:—Household furniture, wood-carving, decoration of friezes, panels, &c., metal *repoussé* work, embroidery and all kinds of needlework, painted glass and mosaics, &c., and artistic printing. Bolder and simpler forms might frequently be adopted, for instance, in decorative needlework, in lieu of the elaborately overwrought chair backs and other smaller pieces of work of this nature that one so frequently sees; less labour would be required to cover larger surfaces with increased decorative effect, if suitable designs are chosen. Many good examples of what I am referring to will be remembered by those who have seen such specimens from South Kensington, Macclesfield, Leek, and other schools where they have succeeded in reviving admirable examples from elder work. Again, there is much that may be accomplished by the amateur in the simpler modes of wood-carving, if this were studied in the spirit of the excellent work which has descended to us from our great-grandfathers, or if we learn something from the hamlets of Germany and Switzerland, or gather up a portion of the skill displayed by the Swedish peasant. We need not fritter away our efforts in carving mere knick-knacks when bolder designs might almost as easily be worked out to cover the surface of our ceiling and wall panels. Such carving, together with *repoussé* work in metals, also worked out on this bolder scale, could be so introduced as to give great distinction to our rooms, and the labour of it not be above the attainment of the amateur. The proof of this last statement may be found in several specimens of work entirely done by amateurs, and now displayed in the rooms of the Liverpool Art Workers' Guild at the Liverpool Exhibition. Especially noticeable is some of the beaten brass and copper-work, and

the carving and modern needlework, some of it being executed in the bolder style just referred to. The work of the professional artist and art-worker is also well represented in the admirably-painted folding screen by Mr. Robert Fowler; the painted majolica plaques by Signor Torquato Castellani, of Rome; the beautifully-drawn and highly-finished cartoons for painted glass by Mr. Walter Lonsdale, illustrating subjects from Shakespeare and Tennyson, are most worthy of close inspection. The examples of old needlework which have been lent for this collection show great variety of methods of working and great patience and skill in execution, and these examples well deserve to be studied. It may be considered that it is the duty of a municipality of the importance of Liverpool by every means in its power to foster the growth of its art productions, and it is to the interest of every citizen to see that such aid and encouragement as it is within his individual power to bestow should be given in this direction. Speaking as an architect—and I am sure my professional brethren can bear me out—the difficulty has frequently been felt of finding local craftsmen competent to carry out special designs or able to work out a suggestion embodying a fresh idea. And because it is more convenient and it involves less trouble to go where it is known that work of this nature can be undertaken, we employ workers in London and other cities. This involves further difficulties, however. Frequently greater expense is incurred than is justified by the result, and the architect, by reason of the distance between himself and the workman, has not the immediate supervision that he would desire to have over his work. It has, nevertheless, been found subsequently in some instances I could name, that the capable man has been existing within your district without your knowledge, and on searching for the reasons why he is not better known, he tells you he has rarely had the opportunity of doing the better kind of work for which he is undoubtedly fitted. He knows that the superior work goes elsewhere, and he has come to despair of any encouragement from his fellow-townsmen. The unwisdom of this state of things is palpable. Then, should we not set ourselves to try and improve matters? Those who accumulate their wealth in Liverpool, when they are expending some of it upon artistic objects ought in fairness to give every opportunity to local talent, indeed, to think of that as a duty—not that inferior work need be the result by any means. The delicate plant cannot live unless it is duly watered, and art will grow and improve where it is most encouraged; then why not in our midst? Liverpool may acquire a reputation as an art centre quite as readily as smaller places have done, if her citizens look to it. Architects will readily concur in any movement which would tend to foster a group of art-workers and skilled craftsmen ready more fully to carry out their views. Ornamental treatment of a design not unfrequently has to be rigidly curtailed, because under the pressure of daily work, time cannot be spared to search out your capable handicraftsman who can work up to the required standard. Bring into prominence your art-worker, and there is work for him to do; give opportunity for the work, and your superior craftsman can be found—supply and demand will react on one another in this instance. In these rooms are held classes attended by the student members of the Architectural Society, and many of them show great aptitude as draughtsmen and designers. It would be a tolerably easy matter to turn their attention especially to the decorative character of work to be encouraged through the guild. Their previous training naturally fits them to participate in its work, and to introduce a freshness and novelty of design, because in several instances these students—the coming practitioners, we may hope, in this city—have searched out, sketch-book in hand, the get-at-able places of interest both at home and abroad, and the opportunity is only wanting that they should work out the ideas they have thus imbibed to some good use. Beyond bringing forward this subject for your favourable consideration at the present moment, I do not venture to lay down the exact lines for the entire working out of the scheme. Many questions will have to be asked and answered, and the fullest discussion is invited in order that the most practical form may be given to the constitution of the guild; that it has a *raison d'être* I hope has been sufficiently shown, and I believe that the formation of a council to discuss and carry out the suggestions here offered will be the best means of furthering the object.

Mr. James Hay, architect, said that what they had just heard explained as to the objects of the association he considered fully justified them in making a commencement with it, and that when it was more fully known he believed it would have the support of the architectural profession as well as that of many influential citizens, and that he would be happy to give any assistance towards the promotion of such a guild.

The Chairman said the first practical step would be to inquire what were the rules of similar societies or guilds which had been formed elsewhere, as these would form a basis for their procedure. He then moved as the first resolution—"That, in the opinion of this meeting, the establishment of a Liverpool Art Workers' Guild is desirable, with a view to the diffusion of sound principles of decoration, and to the encouragement of workmen and others desiring to undertake decorative work of all kinds."

This having been seconded by Mr. Ernest Peel, was put to the meeting and carried.

Mr. Sydney Style said the main point in connection with the work of the guild was to bring the capable workman into connection with those people who want first-class work. Art is the idealisation of fact, and there are three processes which the artist of every kind performs, whether he be the simplest worker in wood or the poet picturing for the nobler states of society. The first is observation, the second idealisation, and the third execution. Now which of these processes can the Art Workers' Guild assist? They can assist the artist in his observation by bringing together a collection of beautiful objects of the kinds in which the different workers will be carrying on their work, and I hope that we shall see in the guild hall a collection of the best models of work of all kinds for the assistance of the workers. The second part (the idealisation) must take place in the mind of the artist himself. He must compare together the different things that he has seen, and, after due meditation, see within something superior to them all. The third process (the execution) may be assisted by providing the aid of competent teachers in the different kinds of handicrafts, and this is work which can very properly be aided by the guild. Mr. Style concluded by proposing that the following ladies and gentlemen be requested to act as a provisional council to consider in what manner the first resolution could be best carried into effect:—Mr. Clarke Aspinall, Mr. and Mrs. H. B. Bare, Mr. Edgar Browne, Mr. and Mrs. H. Clare, Mr. John Finnie, Mr. and Mrs. G. E. Grayson, Mr. James Hay, Mr. F. W. Holder, Mr. and Mrs. E. Peel, Mrs. F. H. Picton, Mr. E. R. Russell, M.P.; Mr. T. C. Ryley, Mr. and Mrs. A. T. Squarey, and Mr. Sydney Style, with power to add to their number.

The resolution having been carried, the meeting concluded with a vote of thanks to the chairman.

THE CHESTER MUSEUM.

THE Grosvenor Museum of National History and Archæology, with Schools of Science and Art for Chester, Cheshire, and North Wales, were opened on Monday last by the Duke of Westminster, K.G., who gave the greater part of the site, and subscribed 4,000*l.* towards the building fund. A view of the museum appeared in *The Architect* on May 31, 1884, from a drawing which was at the time exhibited in the Royal Academy.

The façade on the Grosvenor Road is in a style peculiarly suited to the general picturesque character of the ancient city of Chester, being designed upon the lines of the old Dutch Renaissance so prevalent in the street buildings of Holland in the seventeenth century, before the Mediæval mullions had given way to the more stately but less picturesque characteristics of the severer Classic style. The quaint form of the gables and the cupola to the octagon window at the end of the building also help to diversify the character and add to the picturesque outline of the building. The front entrance is through a semicircular archway nearly 8 feet wide, filled in with wrought-iron gilded gates, and surmounted with carved and enriched archivolt, having its spandrel filled in with bas-reliefs of female figures representing science and art; the frieze over this has carved and ornamental panels with the arms of the county and city inserted, whilst the pediment over contains the Grosvenor arms. The slight projection of the porchway is carried up to the top of the building, and is there finished by a quaintly-formed stone gable filled in with bold carving suited to its position, flanked on each side by carved griffins. The whole of the windows are of great width for abundant lighting, and are broken up by mullions and transoms, with internal divisions of window bars, which accord with the style. The upper lights, excepting those to the art school, are filled in with leaded lights and stained glass. The upper storey of the building is divided into bays formed by stone pilasters with carved capitals, and the cornice surmounting the whole is bold in character finished with balustrade on the top, and a carved and enriched frieze below, the whole being broken up by the two gables before named and the octagon turret, which also serves to veil what would otherwise be an awkward angle caused by the irregular shape of the site. In the front a good balance of colour is shown by the variety and adjustment of the materials, which are of red Ruabon brick for the walling, whilst the cornices, pilasters, and other ornamental features are of Grinshill Hill stone, which form a pleasing contrast in colour. The whole of the carving and sculpture to the front and throughout the building has been well carried out by Mr. Edward Griffith, of Chester, from the designs of the architect, and its execution is of a very high character.

The entrance to the building is through a vestibule 9 feet in width, up a flight of seven steps, upon the landing of which is placed a screen filled in with lead lights and stained glass of good colour and character. Immediately beyond is a large entrance hall and staircase, 23 feet in width, with circular end. This staircase hall gives a pleasing importance to the building, and is of a highly ornamental character. The floor is laid with mosaic tesselated pavement of small tesseræ, with ornamental border round the hall, with a central ornament in which the arms of the city are introduced, a small mullioned window at the end giving light to the ante-room through stained glass in which the arms of the city and county are emblazoned, with a quaint motto wrought into the lower panes—

'Tis education forms the common mind ;
Just as the twig is bent the tree's inclined.

The staircase, which goes round the circular end of the hall, is deserving of a passing notice. It is formed of concrete, supported internally by means of wrought-iron girders built into the wall in the centre of each step, and is thereby much stronger than if built of solid stone. Each step is covered with a hard York stone tread. The balustrade is specially designed and ornamented in a characteristic manner. The entrance hall and the first flight of stairs are finished with a dado of mosaic work in quiet tone, to harmonise with that in the floor beforenamed. The stairs and hall are well lighted by a top light from roof, which yields abundance of light and gives a cheerful impression on entering the building.

The accommodation provided for the various societies in the building may be briefly described as follows, and is comprised on three floors, besides a number of good, well-lighted rooms in basement available for stores and mechanical work required for the various schools, &c. :—On entering the building there is a reception or reading-room, 21 feet by 19 feet, on the left, and on the right is a natural history museum, 36 feet by 25 feet—a well-lighted room, with stained glass in the upper portions filled in with mottoes appropriate to this department. Beyond this is the lecture theatre, 45 feet by 30 feet, having two distinct entrances from entrance hall, besides platform entrance and preparation room behind on the lower storey. The theatre is well lighted by large windows filled in with lead-lights, and the auditorium specially arranged in steps so formed that all may have a view of the demonstrator's table at the bottom ; the seats are most convenient, each being separate, and having a small falling desk to enable students to write their notes upon. From this room there is a lift to the chemical laboratory on the floor over.

On the ground-floor there is a large room opening from the main hall devoted to the exhibition of pictures, for which it is specially contrived, being lighted by a good top light, and boarded all round to enable pictures to be easily attached. This room will be temporarily used as an archæological museum. The first floor is devoted entirely to science, excepting one room, 20 feet by 19 feet, to be used as library and committee-room, and one room, 25 feet by 14 feet, used as a model-room for school of art. The chemical laboratory is 30 feet wide, and has an area of 520 square feet, and there are two classrooms with an area of 1,170 feet. The upper floor is entirely devoted to the school of art, and consists of a large room 66½ feet long and 25 feet wide, and 20 feet in height, lighted from the northwards ; besides this there is a master's room, 14½ feet by 12 feet, formed with a bay, commanding a view of the whole of the teaching space, and also a small room with top light for the use of the master.

The whole of the floors are fireproof, with wrought-iron beams and Dennett arching, which prevents the transmission of sound between the various floors. The artificial lighting is by means of the Wenham patent gaslight suspended from the ceiling of each of the rooms, which gives a brilliant light at a most economical consumption of gas. Special provision has been made for warming and ventilation by means of Haden's system of low-pressure hot-water pipes, with coils of pipes placed in various places, and the ventilating system is by means of a large extraction shaft into which air ducts from the various rooms are conveyed.

The contract for the building has been most satisfactorily carried out by Mr. Edmund Gabbutt, of Liverpool, the general contractor, the special work being executed by the following sub-contractors :—Fireproof construction by Messrs. Dennett & Ingle, of London and Nottingham ; warming and ventilating by Messrs. Haden & Son, of Trowbridge ; carving and sculpture by Mr. E. Griffith, of Chester ; wrought-iron gates and grilles by Messrs. Thomas Wood & Son, of Chester ; stained and ornamental glass by Messrs. Shrigley & Hunt, of Lancaster ; locks and ironmongery by Messrs. Charles Smith & Sons, of Birmingham ; mosaic floors and dados by Mr. Ludwig Oppenheim, of Manchester ; gasfittings by Messrs. Box Bros. of Chester ; the whole work being carried out under the direction of Mr. Thomas M. Lockwood, architect, of Chester.

LEGAL.

Birmingham Assizes.—August 10.

(Before Mr. Justice Wills.)

Crouch *v.* Beesley & Co.—Architects' Fees.

The plaintiff in this case, Mr. Joseph Crouch, is an architect living in Birmingham, and he sued Messrs. D. S. Beesley & Co., engineers, Bracebridge Street, Birmingham, for 37*l.*, commission. In September 1884, defendants proposed making alterations in their factory in Dartmouth Street, and plaintiff prepared sketch plans. Afterwards defendants decided to abandon the project, and to erect a new factory in Bracebridge Street. For this building plaintiff prepared plans, and obtained estimates. It was agreed that the commission should be 2½ per cent. on the cost of the work. The usual charge, plaintiff stated in his evidence, was 5 per cent., and the fee was calculated on the builder's estimate, plus the cost of any extra work that might have to be done. A considerable amount of extra work was incurred in consequence of the foundations having to be carried deeper than was at first intended, the site turning out to be made ground. Plaintiff also did a great deal of work, such as measuring up the timber, which was usually performed by a clerk of the works. The claim included 3*l.* 3*s.* for the preliminary plans and estimates for Dartmouth Street. The defendant had declined to pay the full amount of the commission on the ground that some of the buildings for which plans had been prepared had been dispensed with. Plaintiff and a professional witness estimated the cost of the building actually erected at 1,500*l.* After some discussion, the parties adopted a suggestion from the Judge that they should agree to a verdict. A verdict for the plaintiff for 32*l.* 10*s.* was accordingly agreed to, and his lordship gave judgment for this amount. With regard to the question of costs, his lordship said that though all the buildings had not been erected, the plaintiff had prepared the plans for all of them at the request of the defendants, and was entitled to be paid for his work. The refusal of the defendants to pay the bill was a shabby business, and although, as a matter of fact, the plaintiff was only entitled to County Court costs, in the circumstances he would allow costs on the higher scale.

Liverpool Assizes.—August 5.

(Before Mr. Justice Cave.)

Trustees of Paton *v.* Emmett & Sons.

LIGHT AND AIR CASE.

The plaintiffs in this case were trustees of certain land and property in Oldham, and sought to recover damages for "light and air" from the defendants, who are manufacturers in that town. Defendants paid 175*l.* into Court as ample compensation for any loss sustained by the plaintiffs. The defendants had built a large wall close to the plaintiffs' cottages, which are situated on a piece of land enclosed, near Cromwell Street, in the centre of the business portion of Oldham. Opposite the cottages was formerly an old weaving shed, and it was upon this site that the plaintiffs built and completed this year a five-storey mill. The old weaving shed did not affect the light and air of the cottages, but it was alleged by the plaintiffs that since the erection of the mill the cottages could only be let now at a reduced rental. The question was as to the amount of compensation to be awarded plaintiffs. A number of witnesses were called on behalf of the plaintiffs, and stated that since the erection of the mill the light in the cottages had been very bad. The defendants submitted that the erection of the mill increased the letting value of the cottages. No witnesses were called for the defence, and the jury returned a verdict for the plaintiff for the amount paid into Court. Judgment accordingly.

NEW BUILDINGS.

Poplar Baths.—The baths and washhouses at Poplar have been reopened after reconstruction, which was carried out under the direction of Messrs. Clarkson, architects. Previously the plunge bath had a water area of only 42 feet by 26 feet, including the spaces under the boarded gangways. Now, the clear open water area of the new bath is 75 feet by 26 feet, or nearly double the size of the old bath. The depth of water at the south end is 3 feet 6 inches, and at the north end 6 feet 9 inches. The sloped floor is of glazed bricks, with blue Staffordshire bricks placed at intervals, so as to form a pattern and give foothold. The walls of the bath are lined with white glazed tiles, with a pattern border of blue and brown tiles under the slate curb. A continuous safety rail is placed round the bath just above the water level. There are passage-ways round the water on all four sides, that at the north end where the diving board is placed being about 9 feet wide, the others being narrower. In a gallery, at the height of about 10 feet above the water level, the passage-ways are repeated : this

gallery is reached by two stone staircases. There are dressing-boxes in the gallery as well as below, making up fifty-four in all; also the necessary latrine arrangements. This arrangement seems to have been resorted to in order to avoid the necessity of purchasing land for an extension of the site—a suggestion pressed by the architects, but not adopted by the Commissioners, who have been reluctant to sanction any expenditure which could be avoided—but no doubt a finer effect, though much more costly, would have been obtained if the extension had been made. The gallery floors and the floors of the dressing-boxes are of granolithic paving, by Messrs. Dennett & Ingle, of Whitehall Place. The lighting is by a lantern and roof-lights of considerable size; the whole of the side-lights are hung to open, and are controlled from the gallery level. The gas-lighting is by sixteen star pendants, each of six burners (carried out by Mr. T. Gaisford, 6 High Street, Poplar). The height from the water level to the ridge of the lantern is 34 feet. This ridge is also a ventilator. It is a copper trough turned bottom upwards, and heated air thus collects at the highest point inside the building, and finds its way out through louvred ventilators. A large amount of ironwork has been used; the cast-iron stanchions, &c., were supplied by Messrs. Young, Dowson & Co., of Emmett Street, Poplar, and the wrought-iron work by Messrs. Evans, Young & Co., of North Street, Poplar, all being from special details supplied by the architects. A subway runs outside the walls of the bath, and in this subway are drains, water-pipes, &c. The system followed for supplying the bath is that now most approved, viz., passing all the water through a tank into the bath, and then heating by establishing a circulation of the water, bringing it into the tank or heater at the bottom, and warming it by contact with copper pipes filled with steam. The top of the heater is placed at the level of the bottom of the bath, so that the warmed water strikes upwards through the mass of water in the bath, and renders the temperature high and even. Two new Cornish boilers have been introduced. Each boiler is 5 feet 6 inches in diameter and 24 feet long, and set with a wheel draught, all the appliances and the setting being of the most modern kind. The private baths have been remodelled, Rufford's porcelain baths having been used for the first class, and Stevens Bros.' enamelled iron baths and others for the second class. New fittings and water supplies have been supplied by Mr. Busby. The roof coverings have been renewed throughout, and several of the roofs have also been improved in form. The drainage of the whole of the buildings has been overhauled. Mr. J. Walker was the contractor for the building, and Messrs. Hodge & Sons for boilers, &c. Mr. Buck was clerk of works.

Estate Office, Greenock.—The new building in Ardgowan Square which is to serve as the estates' office of Sir Michael Shaw Stewart, Bart., has been completed. The style of architecture is that which prevailed in Scotland at the beginning of last century. The principal front is to the square, and the entrance door in the centre of this front is reached by an outside stair. Over the entrance doorway is carved the coat-of-arms of the owner, while the panel of the staircase window is filled with the Schaws of Greenock arms, and the circles in the window pediments with the crests of allied families. The new offices are arranged on two floors. On the first is Sir Michael's room, which is entirely panelled with oak. In a panel over the fireplace is an oil-painting of the old mansion-house by Mr. Pollok Nisbet. Adjoining is the factor's room, and behind this rooms for the surveyor and surveyor's clerks are provided. To the west of the entrance is the cashier's room, with a waiting-room attached to it. Entering off the cashier's room is a spacious safe, 16 feet square and two floors in height, and fireproof in construction. The entire upper floor is given up to the legal department. Off the chief clerk's room is a fireproof safe, 14 feet square. Ample lavatory accommodation is provided on each floor, and rooms for the housekeeper in the basement. In the yard at the back are stables and a coachhouse. The architect is Mr. R. Rowand Anderson, LL.D. The building has been erected by the following contractors:—Messrs. Beattie & Sons, masons; Messrs. Meikle & Sons, carpenters; Messrs. P. Bell & Co., plumbers; Mr. Andrew Swan, slater; Mr. Michael Slaven, plasterer. The grates, gasfittings, and safes have been fitted up by Messrs. Finlay & Co., of Glasgow. Mr. George Kermack acted as clerk of works.

ARCHÆOLOGY.

Explorations in Susa.—A vast quantity of relics, the results of the excavations carried on for a long time on the site of ancient Susa by M. Dieulafoy and his companions, have arrived at the Museum of the Louvre. They were brought to Toulon in a transport from Bassorah, and filled 215 chests, that weighed over 40,000 kilogrammes (nearly 40 tons). The chief contents are:—1. Two fragments of a frieze of enamelled earthenware adorned with lions in bas-relief, from the principal entrance to the palace of Artaxerxes Mnemon. Both fragments are over 13 feet high by nearly 30 feet long. 2. A similar fragment of a frieze from the palace of King Darius Hystaspes, adorned with twelve figures of the loyal body guard, the famous "Immortals." This piece is 11½ feet high by nearly 40 feet long. 3. Two fragments of a staircase in same material. 4. Two fragments of terra-cotta friezes, showing fantastic animals. They are together over 20 feet long by nearly 6 feet high. 5. The capital of a pillar from the palace of Artaxerxes, representing a two-headed monster. It is over 16 feet high by 13 feet in width. 6. A collection of cut gems, numbering about 300, which seems to date from the earliest period of the Sassanide dynasty. 7. A large number of arrow-headed inscriptions on stone or glazed earth, mostly from Susa. 8. A considerable collection of bronze coins from Susa and the neighbouring districts, from the time of the Parthians and the Sassanides. 9. A quantity of bronze ornaments and mountings of the outer doors of the palace of Artaxerxes. 10. A number of statuettes of bronze, ivory, terra-cotta, and marble; a quantity of vases and toilet ware. 11. A mass of objects of comparatively small value, enamelled Sassanide vases, Parthian urns for the dead, iron and bronze weapons, instruments, and skeletons. Besides these things the expedition took plaster casts on a large scale of portions of the palace of Artaxerxes, also photographs of the neighbourhood of Susa, the sites of the explorations of various old monuments and ruins in other parts of Persia. It is believed that five or six months will be required to get all the things in order. Diszful, the modern village on the site of Susa, is about 400 kilomètres from Bassorah. At first the expedition encountered much opposition from the natives, owing to a report that the Frenchmen wanted to carry away the body of the prophet Daniel, which is supposed to be buried in a cave in the neighbourhood, a great object of pilgrimage.

GENERAL.

The Design by Messrs. Maxwell & Tuke has been adopted for the Manchester Exhibition building.

Mr. Horace Jones, the City Architect, is to receive the honour of knighthood.

The Collection of Pictures by Old Masters, in Brussels, is to be transferred to the Palais des Beaux-Arts in the Rue de la Régence. The cause of the removal is an apprehension of the consequences of a fire occurring in the old building.

An Autumn Exhibition of Pictures has been decided on at Dundee, and the Town Council has granted the use of the picture galleries at the Albert Institute for the purpose.

Mr. W. C. T. Dobson, R.A., and Mr. G. Clausen are assisting the Hanging Committee in the selection of works for the exhibition at the Walker Art Gallery, Liverpool.

The Committee of the Manchester Art Gallery have secured the assistance of Mr. Phil R. Morris in selecting and hanging the works submitted for the autumn exhibition.

A Marble Memorial of the late Mr. S. Pountney Smith, mayor of Shrewsbury in 1873, has been erected in the cemetery. The design was chosen from a number prepared by Mr. Smith for monumental carvings.

Plans have been prepared by Mr. Noot for a museum and art school at Tunbridge.

A Dome is about to be erected above the main entrance to the Edinburgh University Building, a bequest for that purpose having been left by Mr. Cox, W.S. It has been designed by Dr. Rowand Anderson, architect.

Mr. Charles Cobham, of Gravesend, has been appointed surveyor of the Local Board of Grays.

A Stained-glass Window has been erected, as a memorial of the late Dr. Fraser, in St. Chrysostom's Church, Rusholme, under the direction of Mr. Redmayne, architect, Manchester. The work was executed by Mr. W. F. Dixon, University Street, London.

An Oak Chancel Screen and chancel side screens are to be erected in St. Wilfrid's Church, Standish, at a cost of about 300*l.*

Holy Trinity Church, Smethwick, is to be enlarged. The cost of the work is estimated at 3,000*l.*

A Choir Vestry is to be erected at St. Mary's Church, Oldham, at a cost of 190*l.*

Plans have been prepared by Mr. Naden, architect, for adapting the Imperial Arcade, Dale End, Birmingham, which was originally erected as a commercial building at a cost of 25,000*l.*, for the purposes of a music-hall.

The Linlithgow Town Council propose to purchase the old Fleshmarket, and to obtain plans and estimates from Mr. J. Russell Walker, architect, of Edinburgh, for the erection of a town hall on the site.

The Glasgow Architectural Association on Saturday visited Kilwinning Abbey, and after a short description had been read by Mr. W. J. Anderson, a couple of hours were spent in sketching and measuring the old remains. Passing on to Kilbirnie, the company visited the interesting old church there, with its quaint woodwork in roof and gallery fronts and canopies.

The Architect.

THE WEEK.

M. Alphand's proposals for the Paris exhibition of 1889 have been approved by the Minister. The Champ de Mars will be disposed in the following way. At the end which faces the Seine the colossal iron tower will be erected as a detached structure. The lower part will be arranged to serve as the principal entrance. Along the left side of the plain which is now bounded by the Avenue du Suffren, the Palace of Fine Arts will be constructed, according to the design of M. Formigé. On the right side will be the Palace of the Liberal Arts (architecture, industrial art, decorative art), of which M. Formigé will also be architect. It is an innovation to remove architecture from among the fine arts, and the French architects should certainly insist on a better classification. If allowed to pass, it will be more difficult to obtain the recognition hereafter and in other places. The industrial and commercial products of France will be exhibited in a building running along the right side of the plain, and bounded by the Avenue de la Bourdonnaye. M. Baudu is the architect for this part. Opposite will be the range of buildings for the products sent by foreigners. At the south side, near the Ecole Militaire, will be the section for machinery, designed by M. Dutert. The central space is to be laid out as an ornamental park, and the gardens of the Trocadéro on the right side of the river will be appropriated to an exhibition of horticulture.

Birmingham lost one of its worthies on Tuesday by the death of Mr. Peter Hollins, the sculptor. As he was in his eighty-sixth year, he was the witness of many changes in the town. His father, William Hollins, was an architect as well as a sculptor, and other members of his family also acquired reputation as artists. Peter Hollins was taught drawing by J. V. Barker, and among his fellow-students was Thomas Creswick, afterwards an admirable landscape painter, who was elected a Royal Academician. For sculpture his father was his principal teacher, although he spent a short time in Sir Francis Chantrey's studio. Peter Hollins removed to London, and about fifty years ago exhibited in the Royal Academy and elsewhere. He returned to Birmingham in 1844, and became his father's successor. The statue of Sir Robert Peel in New Street, and of Sir Rowland Hill, in the hall of the Post Office, are his works. He produced many busts of eminent inhabitants, and executed a large amount of architectural sculpture. Mr. Hollins was the oldest member of the Birmingham Society of Artists, and for a time served as one of the vice-presidents.

The results of the voting among the purchasers of the catalogue issued in connection with the *Pall Mall Gazette* are in general satisfactory, as they show that the public do not fall into gross errors when judging pictures. About two thousand people assumed the office of critics. That the best picture in the whole exhibition (as well as the best classical picture) was Mr. Alma Tadema's *Apodyterium* was testified by the majority, and this shows the value of a deceptive representation of marble. Decorative art is so much of a stranger in England, it is satisfactory to find that 265 voters were of opinion that the President's painting for a ceiling should come first. Mr. Burne Jones's *Depths of the Sea* was supposed to meet with little favour, but it found about the same number of supporters. Mr. Orchardson comes fourth and Mr. Long fifth. In historical pictures Mr. Lucas is first with his *Peter the Great at Deptford*, as it received 150 votes over the *Cromwell at Dunbar* by Mr. Gow. Mr. Frith's *Dr. Johnson's Tardy Gallantry* takes third place before Mr. Boughton's *Councillors of Peter the Headstrong*. Mr. Leader's *With Verdure Clad* gains first, and his *End of the Day* second, place among the landscapes, while the third, fourth, and fifth are assigned to Mr. Vicat Cole. Mr. Moore's *Mounts Bay* rightly is put at the head of the marine pictures, Mr. Brett's *Argyll Eden* being second, and Mr. Hook's *Broken Oar* third. *Union is Strength*, by M. Rivière, is considered the best animal picture. In portraits Mr. Holl is first with his *Duke of Cleveland*, second with *Sir John E. Millais, Bart., R.A.*, and third with the *Right Hon. J. Chamberlain*. The best domestic picture is Mr. Dicksee's *Memories*, for which 702 votes were awarded, while for the *Mariage de Convenance*, by Mr. Orchardson, there were only 256. There seems to have been a nearer approach to unanimity about the classical pictures than about the remaining classes. The *Apodyterium* gained pre-eminence with 873 votes; 372 were given for the President's *Ceiling Decoration*, and 327 to Mr. Solomon's *Cassandra*. Mr. Calderon's *Ruth and Naomi* is placed before Mr. Watts's *Cain* and Mr. Long's *Pharaoh's Daughter* among religious pictures. The merit of the water-colours was apparently difficult to decide, for no more than 194 people could agree about one drawing, that being M. Roussoff's *Angioletto*. Mr. Faed wins second and Mr. Waterhouse third place. Mr. Sant was considered to have painted the "prettiest baby." There could be no question that any one of Mr. Herbert's numerous works was entitled to be recognised as the worst of all the pictures; the *Judgment of Daniel* is, however, assigned the lowest place. Mr. Sargent's portrait group found 171 people to condemn it. It will be observed that with the exception of the water-colours an Academician or Associate stood at the head of the different sections.

The committee who have charge of the arrangements for the proposed Fine Art Gallery in Leeds have agreed to obtain designs by competition for the building, which is to be erected beside the new municipal office. The competition will be restricted to local architects, and, indeed, it would be well if that principle were more often adopted by local authorities. A prize of 50*l.* will be given for the best design, and one of 25*l.* for the second best.

It is not often that contractors are so unlucky as to find their claim rejected by an arbitrator. This has just happened to Messrs. Pattinson, of Ruskington, after a three days' hearing before Mr. Henry Law, C.E. They claimed 1,948*l.* 19*s.* from the Hinckley Local Board, partly for extra materials and work caused by meeting with running sand in connection with the construction of a sewer, and partly for sums which had been deducted for surface damage claimed by the occupiers of land. Mr. Law has just announced his award, and finds the contractors are not entitled to a penny in respect of their claim. The case is remarkable, and more should be made known about the circumstances which led to the decision. We cannot imagine two contractors inventing an account for 2,000*l.*, or solicitors and barristers conducting an entirely fictitious case.

It is not unlikely that the dispute between Mr. Hawksley and the Liverpool Corporation will sooner or later be settled in the law courts. Some months ago he declined to participate in a dual responsibility for the construction of the great reservoir which is in progress in Wales. It could hardly be expected, however, that by resigning his office of engineer-in-chief, Mr. Hawksley made a present of his past services to the Corporation. His account was sent in, but remains unpaid. It was proposed by Mr. Hawksley's solicitors that a settlement would be facilitated if his accountant went over the bills with the accountant of the Corporation. The Water Committee, in reply, say they do not admit that Mr. Hawksley has any claim against the Corporation under his agreement or otherwise. This is a new way of paying old engineering debts, which will cause some surprise in Westminster. Mr. Hawksley is not the man meekly to accept a rebuff of the kind, and for the sake of his profession he is, moreover, bound to fight the case to the end.

The handbook which has been prepared in connection with the approaching visit of the British Association to Birmingham will, from its character, be of more than temporary interest. Among the contents will be chapters on "Old Birmingham, Modern Birmingham, Literary, Scientific, and Artistic Societies," by Mr. S. Timmins; "Libraries," by Mr. J. D. Mullins; "Architecture," by Mr. J. A. Cossins; "Painting," by Mr. E. R. Taylor; "Sculpture," by Mr. W. Wallis; "Music," by Mr. W. B. Marshall; "Manufacturing Industries," by Mr. C. J. Woodward. The geology, zoology, botany, &c., of the district will also be described. The volume will contain over four hundred pages.

A HISTORY OF DERBYSHIRE.*

THE third volume of the new series of county histories is a good exemplification of the spirit which inspired the undertaking. It is impossible to put all that can be related of any county in a volume of moderate dimensions, but at least the most important local events can be described in three hundred pages. The "Popular County Histories" carry out the title by the avoidance of everything that belongs to the Dryasdust school. In narrating events the background is not forgotten, and the volumes are topographical as well as historical. A tourist will find them to be an agreeable companion to the ordinary guide books, and they may rightly claim to belong to the class which is indispensable to every gentleman's library.

Life is so multiform in England, it is never easy to plan a history of any district that will be illustrative of the general progress. Too often the historian fixes his eyes on the Court, and considers everything in relation to it as a centre. In that way, Derbyshire would at one time be made to have importance, because MARY QUEEN OF SCOTS happened to be a prisoner in some of the houses. Now, it will be admitted without much hesitation that the county has a stronger reason to be proud of the residence of "GEORGE ELIOT," who, in Derbyshire, saw a few of the best of her characters. There are many high-sounding names associated with the county, and a legion of romances could be made out of the histories of the Derbyshire castles, but the world is more indebted to the natives of a humbler class, who invented the "spinning-jenny," who introduced the manufacture of silk, and who devised improvements in pottery making. In treating of a district which was parcelled out among a few families, writers are apt to be subjected to the glamour which accompanies everything that is supposed to be chivalric, and we are accordingly glad to find the author of this new history reminding his readers that the Derbyshire miners often reveal as dauntless a courage "as that of the bravest knight who ever rode with visor down and lance in rest to perilous encounter." When so true a note is struck in the introduction, we need not fear to find in the pages which follow anything that will be suggestive of a chronicler in livery.

Mr. PENDLETON begins with Derby, a town so thoroughly modern that people are likely to forget that it was a royal borough in the CONFESSOR'S time, and was long before a place of importance. The Free School dates from A.D 1160. St. Peter's Church is of the thirteenth century, St. Alkmund's of the fourteenth, and All Saints of the fifteenth, and there are remains of a few old houses. The sandstone used in the churches has not, however, stood well. The tower of All Saints is the most remarkable example of old work. It dates from A.D. 1527, and bears the inscription "Young Men and Maydens," which might have been invented to puzzle archæologists. The town has had its share of celebrities. Among the artists are JOSEPH WRIGHT, who preferred to paint figures under artificial light in order to display his chiaro-oscuro; and EDWARD BLORE, the architect. The most eminent of the townsmen is Mr. HERBERT SPENCER, whose papers on the mathematics of construction—in the days when he was a civil engineer—are generally dated from Derby. According to the historian, the town is "developing daily, it is extending its industries, replacing narrow ways and tumble-down houses with fine broad streets and handsome shops."

If the capital is entitled to first place, what town should come second? We can imagine Mr. PENDLETON pondering over the question, and then getting out of the difficulty by simply taking the county map for a guide, turning to the west instead of the east, and in this way pitching on Ashbourne. There is, apparently, no other reason why it should come second. The town is exactly the kind of place that confounds a historian. It seems too sleepy to be the scene of any event worth relating, and we can understand the difficulty of the antiquarian who, for the want of something better, recorded that in Ashbourne he was sworn in as a militiaman. The parish church is, however, of great importance, and was founded by Bishop PATISHULL in 1241. There are old monuments of great interest, and BANKS'S figure of a little girl is one of the masterpieces of modern sculpture. The neighbourhood makes up for the dulness of the town. Dovedale is near, and it was to Mayfield TOM MOORE emigrated from London drawing-rooms, when he was compelled to invent something that would pass for Eastern life in "Lalla Rookh." ROUSSEAU and HUME, the historian, lived near Ashbourne, and in Dovedale WALTON and COTTON terebrated worms on hooks in the loving way enjoined in their book. SAMUEL JOHNSON and CANNING were also visitors to the district.

Wirksworth, from its lead mines, must have been a place of note from time immemorial. It was known to the Romans, and, according to our historian, it "has the honour of being the place where the first Derbyshire county match was played." "GEORGE ELIOT" visited the town in 1837, and there met the man and woman immortalised as DINAH MORRIS and ADAM BEDE. In the same part of the county is Matlock, which, it appears, was discovered as a "health resort" in 1690. The builder of the earliest bath was named FERN.

The first of the historic houses described by Mr. PENDLETON is Chatsworth. We are told that the existing building "is not the house Sir WILLIAM CAVENDISH began to build, and which his widow, the famous 'BESS OF HARDWICK,' completed. That old English house, which superseded the more ancient hall of the LECHES and AGARDS, was a quadrangular building with square towers, rude and Mediæval in look compared with the modern fabric." Chatsworth would need a volume to do it justice. The best artists that could be obtained have helped to its adornment, and it is to the credit of the owners that the works were never intended for ostentatious display or to secure a reputation for taste. The CAVENDISHES seem to have always enjoyed the art that was around them.

Haddon Hall comes next, and is very different in character to Chatsworth, which is remarkable for its modern spirit and grace. Certainly there is picturesqueness in all that remains of the old baronial mansion, but the work does not do much credit to the Mediæval craftsmen. The doors especially are badly framed and hung. According to the "Archæologia," they were all concealed by hangings, and the contractor took advantage of the opportunity. Mr. PENDLETON says that "visitors linger longest in the lord's parlour, through which DOROTHY VERNON stealthily glided with fluttering heart in her flight from home." That is to say, Haddon, with all its charm, would not be much of a success if the story of an elopement had not been forthcoming.

The VERNONS appear to have exercised an almost absolute power in the district. Sir GEORGE VERNON was known as "King of the Peak," and it is related that on one occasion without any trial he had a man hanged who was afraid to undergo the ordeal of touch. But in their way the owners appear to have acted up to the motto which is seen over one of the fireplaces, "Drede GOD and Honor the Kyng."

Sir THOMAS WENDESLEY, who lived in the district, was another of the monarchs of Peakland. His manner of acting is seen from the petition to the Crown of "a poor and plain esquire," one GODFREY ROWLAND, who complained that he was carried off by Sir THOMAS and his retainers, that he was imprisoned in the Castle of High Peak for six whole days without meat or drink, and that afterwards he was brought out and his right hand was cut off. Whether the victim obtained justice is apparently unrecorded.

There are many interesting villages in the north part of Derbyshire, and Mr. PENDLETON tells us a good deal about the quaint customs which at one time were found in them. The nature of the country has given rise to legends, and the local poets have amused themselves in turning them into verse. Mr. PENDLETON'S book contains a good many, we might even say too many, attempts of that kind.

Invalids have a kindly feeling towards Buxton, and it shows the shrewdness of the Romans when we learn that "they greatly valued the warm springs that issue from the base of St. Ann's cliff." In the Mediæval age Buxton was not supposed to depend for success on the chemical constituents of the water or the salubrity of the air, and it was, therefore, one of the places inimical to Lord CROMWELL when carrying out his reforms. His agent, BASSETT, informed him how he had "locked up and sealed the baths and

* *A History of Derbyshire.* By John Pendleton. London: Elliot Stock.

wells of Buckston, that none shall enter to wash until your lordship's pleasure be further known." The waters continued to flow in spite of Cromwell, and people could not be restrained from utilising them. The Earl of Shrewsbury soon afterwards erected a bath-house. Great folks and humble alike went there to be cured. Leicester, Burghley, and Sussex were among the visitors in Elizabeth's time, and Mary of Scotland was brought there from time to time during her captivity. Buxton was one of the places selected by Macaulay to illustrate his third chapter. He tells us that in the seventeenth century the gentry were crowded into low wooden sheds, and regaled with oatcake and meat which was called mutton, but which was suspected to be dog. Mr. Pendleton declares that Buxton cookery now is of a different kind, and is as useful as the waters in conferring happiness.

Sheffield comes so near the county boundary that Mr. Pendleton does not hesitate to include the town in his book as if it were a part of Derbyshire. He has much admiration for the town and its inhabitants. The staple manufacture of Sheffield is comparatively recent, for it was not until 1624 that the Hallamshire cutlers were able to acquire sufficient standing to allow of the formation of a worshipful company. In 1749 the annual feast cost only *2l. 2s. 9d.*, and half the money was expended on ale and punch.

It must be owned that few towns have less to show that is interesting to the archæologist, and the inhabitants do not encourage architecture in proportion to their wealth and needs. Sheffield is always disappointing to a visitor. When Mr. Ruskin set up his museum at Walkley, he may have thought that no town stood in more need of something that would suggest the value of beauty, and the unpretentious little house in which his treasures are placed merits to have more visitors than it receives.

Mr. Pendleton, after leaving Sheffield, takes his reader through the east side of Derbyshire. First he comes to Norton, where Chantrey was born, and the sculptor receives more than his due share of praise. Then we pass Dronfield to Whittington, where a good deal of trouble is taken to magnify the meeting between Cavendish and Danby, as if it were the principal cause of the success of the Revolution of 1688. Macaulay simply says:—"The two noblemen had met at a village in the Peak, and had exchanged assurances of goodwill." The position held by the Devonshire family was, however, enough to have the centenary of the meeting celebrated with great pomp in Chesterfield. There was a sermon in Whittington Church on the text, "This is the day which the Lord hath made;" there was "an elegant cold collation," and there were dinners at all the principal inns for the crowds. It is no wonder that people look forward to a second celebration of the kind in 1888, when, as the song says, with "A flowing bowl they'll sing to the Glorious Revolution."

Chesterfield is best known by the crooked steeple of the parish church:—

> Whichever way you turn your eye,
> It always seems to be awry;
> And while it stands must ever be,
> An emblem of deformity.

Various reasons have been offered to explain the phenomenon, Satan himself being described as the malefactor; but the real cause is a commonplace twisting of the woodwork. The town is ancient. It was part of the property given to his son William Peveril by William the Conqueror, and subsequently could claim to be a royal burgh, for it was held by the kings. Since then it has had many vicissitudes, but it is now a thriving place, and, as it owes much to railways, the townsfolk acted in good spirit when they raised a building as a memorial of George Stephenson, the engineer, who lived during his latter years in Chesterfield.

Bolsover is not an important place now; still, "nearly every inch of ground is historic, from the little Norman church with its alabaster and marble tombs of long-dead celebrities to the lofty castle, rising, foliage fringed, high above the precipitous rock." The castle is not the original fortress built by Peveril, but an imitation that was erected by Sir Charles Cavendish. It is still habitable, and a story is related that the wall-paintings in one of the bedrooms, which are partly defaced with whitewash, met with that fate through the uneasy conscience of a former occupant, who, "cursed with an uneasy conscience, was rendered so uncomfortable by the contemplation of these very differently situated seraphs, that he took a lime-brush and ruthlessly wiped out sinners and saints." The later building on the south of the castle, which has fallen into decay, was the mansion where the Marquis of Newcastle entertained Charles I. A masque was composed by Ben Jonson for the occasion.

Hardwick Hall can be seen from the roof of Bolsover. It was one of the castles raised by the famous "Building Bess," Countess of Shrewsbury, who, according to Fuller, was a builder, a buyer and seller of estates, a money-lender, a farmer, a merchant of lead, coals, and timber. The origin of her passion for building houses is said to have been a gipsy's prophecy. The strong-minded dame was told that so long as she continued to build she was safe from death. In this way Hardwick, Oldcotes, and the older Chatsworth were erected. It is a pity gipsies cannot be utilised for such a purpose in our time. Hardwick Hall might serve as a model for people who believe in the curative power of light, for, according to one writer, it "seems to have been designed to ascertain how little of stone and how much of glass might possibly be combined together in the formation of a splendid edifice." The gallery has eighteen windows on one side, each having 1,500 panes. The hall, if of less architectural interest, would derive value from its historic portraits and tapestries. The remaining buildings described are Wingerforth Hall and Wingfield Manor, the latter being known as one of the many prisons of Mary Queen of Scots.

In taking leave of this interesting book we again recommend the series of which it forms a part to the attention of our readers. The "Popular County Histories" will afford both pleasure and profit to readers.

THE MEDIÆVAL BAPTISMAL FONTS OF ENGLAND.

[By a Correspondent.]

THERE is scarcely a single feature in English Mediæval architecture where a more extraordinary variety of design is seen than in the baptismal font. This country is, in fact, remarkable in this respect as compared with the rest of Europe. Those who are in the habit of examining the interiors of our English churches find in this one detail an ample and practically unbounded field for either the exercise of the pencil or the study of architectural composition.

For the Mediæval men, with loving and willing hands, have expended on the font a very large part of their labour. Taking the Norman period, for example, there is a greater amount of sculpture preserved to us in the fonts than in the doorways. Often as the latter have been reset in the later buildings, when the Norman church had been pulled down, yet the specimens of fonts of this date are more numerous. If we compare a number of examples of the Mediæval pulpit, for instance, with the Mediæval font, it will be found there is much less variety in the former than in the latter, not only in the general composition but in the materials used. It is true that the old pulpits still remaining are very few indeed as compared with the multitudinous array of fonts, the preservation of which, even to the most ancient, is accounted for by the reverence accorded to that great sacrament for the celebration of which they were erected. And this is likewise true, while admitting that the pulpit for the parish church is most rarely to be met with of earlier date than the fifteenth century, except in the case of those erected in monastic refectories (such as the beautiful specimen of the thirteenth and fourteenth century respectively, at St. Werburgh's, Chester, and at SS. Peter and Paul, Shrewsbury, formerly), which might just as fitly be called lecterns as pulpits. For from them devotional writings were read while the monks were at meals. There is a greater variety in, say, a dozen Perpendicular fonts selected at random than in a dozen pulpits of the same period. The Mediæval pulpit was always made of wood or stone, whereas the font was either of granite, marble, stone, or lead, or even in one example, at Chobham Church,

Surrey, of wood and lead. While thus comparing fonts with pulpits, it may be worth while to remark that the former were square, circular, and octagonal sometimes, though seldom hexagonal, and of other forms exceptionally. The latter were in plan hexagon, heptagon, nonagon, and in one specimen at least (Long Sutton Church, Lincolnshire), sixteen-sided.

This essay can make no pretence to enter very deeply into the matter, but must be looked upon rather as an attempt to touch the fringe of a vast and greatly interesting subject. It is surprising that more should not have been written on so attractive a topic.

In English churches built in the Italian style there is very little variety in the font, as is shown in the churches designed by WREN and his successors in the City and other parts of London. The normal type is a tall vase-like form, the proportions of which are very different to most of the more ancient fonts. It seems remarkable that with the wealth of Mediæval specimens to be met with in every part of England, the Renaissance architects could have learned so little.

The interesting and well-got-up works by Mr. PALEY and Mr. SIMPSON give us a large number of examples of English fonts of all periods and of very diverse design. Yet those therein illustrated form but a small proportion as compared with those not delineated, many of them quite as remarkable and original in design.

At the present time it seems considered almost *de rigueur* on the part of the architect to make the font octagonal in form. The octagon is called the type of regeneration, and a very appropriate figure too. Another advantage the writer has found in it is that this form with its eight angles is very suitable for inexpensive fonts, being decorative in itself, even with very simple ornamental panels. A circular font, on the other hand, looks plain unless it has a series of panels around it.

Though the square plan is very characteristic of Norman fonts it is not out of harmony with details of a later period, and in Cornwall, where all the changes of style, owing to its remote isolated position, came very late, there are specimens of fifteenth-century fonts of this shape. The square bowl is not necessarily heavy-looking, if carried on a circular or octagonal central stem with smaller shafts under each angle. This is very much better than a certain feature of some modern octagonal and circular fonts, where the shafts spring outside the line of the bowl and are carried up to the top, supporting—nothing. In Classic architecture engaged or detached columns are often carried up a façade to the top of the building; but there they support the entablature, and may be said to be in the nature of buttresses, or, at any rate, suggestive of them. This is not so in the case of fonts or pulpits where no entablature or buttress is needed. In the former there is commonly only a plain splay at the top of the bowl. It must, however, be acknowledged that, in the case of the bowl to the Early English font at Weston Church, near Spalding, Lincolnshire, there are shafts without base mouldings, and bracketed out, which carry nothing. In some examples of ancient fonts with square bowls there are nook-shafts flush with the general face, and to these the before-mentioned objection cannot apply, any more than to the nook-shafts of Transition-Norman buttresses, or the columns, obviously in lieu of buttresses, in some of the early Romanesque churches of France, as at St.-Remi, Rheims. In old examples, octagonal fonts with detached shafts at each angle and a central stem are rare, but where they exist are effective features. In many of the ancient specimens the transition in plan from the bowl to the stem produces, it may be said, mitreing, or what perh aps might more fitly be called "interpenetration" in a Flamboyant-like fashion, more curious than beautiful. A well-devised sculptured leaf or bunch of foliage or floweret then becomes of service to remove the awkward join, and is an expedient quite in the true spirit of the Middle Ages, turning what might prove a blemish or deformity into "a thing of beauty" and "a joy for ever." In complex vaulting how awkward-looking in some cases would the junction of several ribs of various curves and radii be but for the carved bosses which prevent this being seen!

The writer, as before stated, does not profess to go fully or exhaustively into fonts; but it may be well, before proceeding further, to briefly tabulate the various plans of fonts. It is not at all infrequent to find the bowls, bases, and shafts not of the same period. Broadly speaking, of course the square bowl, with four circular shafts at each angle, is the most typical form in the Norman period. The well known examples at Winchester Cathedral, East Meon Church, Hants, and the old font to the Priory Church, Christchurch, Hants, are specimens.

In the Early English style the bowl may be said to be the most characteristic, but there are comparatively few examples left to judge by. In the Decorated and Perpendicular fonts the octagon is the most usual plan of bowl. All these plans, however, may be said to be interchangeable in the different styles, except perhaps the circular bowl, of which there seems hardly an example in the Perpendicular period. Octagonal Early English, circular Decorated, and square Perpendicular are to be found.

Though the diameter of ancient fonts of all dates varies considerably, as well as the height, yet the canonical rule of the font being sufficiently capacious for the total immersion of infants was well kept. In many cases the fonts are now too low for the convenient celebration of the baptismal rite, but this arises through the shafts having been modernised or truncated, or owing to their being of later date than the bowls. It is, indeed, far more common for obvious reasons to find the latter the more ancient. In some of the earlier and ruder fonts the shafts seem to have been set direct on the platforms without base mouldings. In some instances the welding together of bowls and shafts of different dates has been so successfully accomplished that the eye at first fails to detect the junction, though a closer scrutiny reveals the fact of there having been no attempt to intentionally conceal the alteration, but only to prevent any appearance of discordant elements.

Before criticising in detail various examples of fonts, the writer would draw attention to certain characteristics generally found in fonts, whether Norman, Early English, Decorated, or Perpendicular. For instance, it is far more usual for the top of the bowl to be square or slightly rounded than to have a bold projecting moulding or cornice. In some later examples a suggestion of embattlement is found, or perhaps a small carved boss or patera in a hollow moulding, but is not so common as the square-edged top. This is not to be wondered at, as the font, not generally being more than three or three and a half feet high, a cornice is scarcely needed unless the design be of a very ornate character. Again, it is rare that the bowl is divided into half vertically by any projecting moulding or necking, and, as a general rule, the bowl is straight-sided in section, not convex. In practice it was no doubt found that this was the most convenient arrangement for ornamentation, and the most fitting form to surmount the pedestal or shaft. No more interesting study can be found than the analysis of the architectural composition of these beautiful memorials of our ancestors' piety, and the dissection, metaphorically speaking, of their anatomy.

(*To be continued.*)

THE PROTECTION OF STONEHENGE.

THE following report of a deputation appointed to examine into the present state of the stones at Stonehenge was read at the annual meeting of the Wilts Archæological and Natural History Society:—

In the course of last autumn and winter urgent appeals were made from time to time to the Wilts Archæological and Natural History Society to lift up its voice with all the authority it possessed in defence of Stonehenge, which was reported to be undergoing daily injury at the hands of an unchecked public, whereupon the Society resolved to send some of its own officers to see for themselves, and report its condition.

Accordingly a deputation (consisting of the two honorary secretaries, a former honorary secretary, and one of the curators of the museum) visited Stonehenge on July 20 last, and carefully examined every stone in order, noting down on the spot its exact condition, with special reference to injuries of recent date, and now desire to finish their task by submitting the following detailed report to the Society. The numbers refer to the very handy plan of Stonehenge in its present condition, appended to Mr. Cunnington's "Notes on the Fragments," printed in 1884, in the *Magazine*, vol. xxi., p. 141:—

No. 1, slightly injured by recent chipping and cutting of letters; 2, untouched of late years; 3, two very small chips of

recent date; 4, chipped in several places recently; 5, chipped in two or three places; 6, much chipped; 7, very much chipped; 8, original surface not only injured, but completely gone, though not much damaged of late years; 9, injured in two places; 10, slightly scratched; 11, slightly scratched; 12, surface very much damaged; 13, surface considerably damaged; 14, uninjured of late; 15, very little injured; 16, worn by constant walking on, but otherwise not recently damaged; 16 L., not much injured of late; 17, very badly chipped, and lately (one piece taken off measuring 10 inches by 8 inches); 18, not seriously damaged; 19, very badly chipped, large pieces gone in many places; 20, damaged by footmarks only; 21, also injured by walking on; 21 L., badly worn by footmarks; 22, in good condition; 23, initials recently cut, and stone chipped on the outside (this stone, on the north side, has a crack, which has recently increased very much, and should be at once stopped with cement or otherwise); 24, in good condition; 25, badly chipped; 26, no damage, stone too hard to be cut; 27, no damage, but rabbits at work beneath it; X., much walked upon, and so injured; S. 28, underground, and not visible; 29, not damaged; 30, a little pecked by some sharp instrument, but not much injured; 31*a*, not much injured, though slightly chipped; 31*b*, two chips on this stone; 32, not damaged; 33, chipped, but not very recently; 34, not damaged lately, but a large piece was broken off about fifteen years ago (rabbits at work below); 35, worn by feet; 36, much worn by feet; 37, not much damaged, except by feet; 38, damaged by feet, otherwise uninjured; 39, also damaged by feet; 40, very much worn by feet; 41, much worn by feet; 42, slightly chipped, otherwise unhurt; 43, chipped a little, otherwise in good condition; 44, chipped, and also worn by feet; 45, in fair order; 46, very slightly damaged; 47, very slightly damaged (these two stones are in pretty good order); 48, very little injured (this stone has a curious diagonal vein of infiltrated silex across it); 49, letters recently cut on it, and otherwise chipped; 50*a*, very much worn, the surface entirely gone from walking on it; 50*b*, surface gone by feet (rabbits burrowed below); A, very much worn by feet; 50 I., mortice worn by feet, otherwise in fair condition; 51, one recent chip, otherwise in good order (this stone does not appear to have gone any further in the incline from what it did many years ago); 52, very much damaged by feet, and by boys making a slide down it (rabbits burrowed below); 52 I., not recently damaged, excepting the edge, which is worn away by many feet; 53, surface worn by feet, otherwise in good order; 54*a*, damaged by footmarks, otherwise not injured of late (rabbits burrowed below); 54*b*, in fair order; 54*c*, in fair order; 54 I. *a*, slightly injured on surface; 54 I. *b*, very badly worn on surface; 54 I. *c*, somewhat injured, but not very materially; 55, very badly chipped; 56, very slightly chipped, otherwise in good order; S. 57, underground, therefore protected from injury; 58, chipped, cut, and badly scratched; 59, in good order; 60, very much injured by feet; 61, also much injured by walking on; 62 (under 50*b*); 63, very much damaged by feet; 64, upright and in good order; 65, recently injured by the carving of initials and scraping; 66, likewise recently carved and chipped; 67, under a stone, therefore not damaged; 68, worn by feet.

In addition to these stones within the area there are certain outlying stones which require notice.

(*a*) An outlying stone, lying to east-south-east. About nine years since a fire was lighted against this stone, when a large piece was split off, by some accounts as large as a horse's head; otherwise computed at three-quarters of a hundredweight.

(*b*) The Slaughtering Stone; an attempt has evidently been made (whether in ancient or modern days is uncertain) probably to remove a corner of this stone by means of six holes cut in a line, after the manner of breaking sarsens now practised.

(*c*) The Friar's Heel, otherwise known as the Devil's Heel, much chipped, and very much inclined.

In addition to the injuries detailed above, it should be added that scribbling with chalk all over the stones has been indulged in to a large extent, and, though such chalk marks may not be positively injurious, they are very disfiguring, and should not be permitted.

It should also be mentioned that rabbits have burrowed beneath several of the stones, as has been already noticed; and this would form a very serious item of danger but that steps have been taken for the banishment of that mischievous rodent, and it is sincerely hoped that, by continued vigilance on the part of the keeper, no injury need now be apprehended from that source.

The practical question now arises, what (under the circumstances detailed above) is the recommendation of the deputation; and on this point we are of opinion that, owing to the increase of visitors, and bearing in mind the irreparable injury to the stones constantly going on at the hands of thoughtless or mischievous tourists, the time has come when the monument should be properly protected. First, by a fence which should exclude all carriages and horses from the area; but in lieu of any unsightly railing, which would destroy the wild character of Stonehenge, a sunk fence, or ha-ha, is the barrier strongly recommended, and that too at a considerable distance beyond the trench which encircles the precincts proper. Secondly, by the appointment of a caretaker, who should be in responsible charge of the monument, with power to enforce the regulations with which he would be provided; who should admit all visitors through one entrance only near the stone known as the Friar's Heel; prevent all picnicking within the precincts, and, above all, prevent all injury to the stones, whether by chipping or marking, or scratching or standing on them. Whether the salary of such caretaker should be provided by a small entrance fee, or otherwise, would be a matter of after consideration.

So far as regards the protection of Stonehenge.

The deputation has no desire to see the restoration of Stonehenge, and with this view is not in favour of the replacement in an upright position of the tall leaning stone, which is so remarkable a feature of the monument, and whose readjustment has been advocated by many leading archæologists. At the same time perhaps means should be used to secure it in its present position, for the fall of such a stone would be a dire calamity. The deputation does, however, recommend very earnestly the following precautionary measures to be carried out as early as possible. (1) The stones 6 and 7, with their lintel, to be pushed back into their original position, and secured there, when the unsightly wooden props and buttresses could be removed. (2) The stones 25 and 1, with their impost, to be in like manner pushed back into position and secured there, before they lean further towards the outside and fall, as they threaten to do at no distant date, unless previously attended to. (3) The stone known as the Friar's Heel, which is very much inclined, to be carefully examined, and, if pronounced unsafe, to be securely fixed. The deputation desire to direct special notice to the three points named above, as requiring immediate attention; but they cannot conclude their report without advocating with all their might the re-erection, at the same time, of the great trilithon which fell in 1797, whose exact position is undoubted, and whose replacement has been so often urged by the most distinguished antiquarians, notably by the Royal Archæological Institute, when it met at Salisbury in 1849, under the presidency of Mr. Sidney Herbert. Should the proper appliances for readjusting the stones 6 and 7, and 25 and 1, mentioned above, be procured (whether, by permission, from the Royal Dockyard at Portsmouth, or elsewhere) it would seem an opportunity not to be let slip, now, if ever, to re-erect the great trilithon, which, if replaced in position, would add so much to the grandeur and imposing appearance of Stonehenge, and whose prostrate condition is lamented by so many.

We would, in conclusion, disclaim any intention of interfering beyond our province. Stonehenge is a national monument, of such world-wide renown, and its well-being and protection from injury are so intimately connected with the work of the Wiltshire Archæological Society, that it appears to us a paramount duty on the part of the Society to speak out boldly on this question, and we have therefore not hesitated to express our decided opinions.

TESSERÆ.

Operating on Da Vinci's "Last Supper."

James Barry, R.A.

When I came into the refectory I found a scaffold erected, which, on ascending, I saw one-half of the picture covered by a great cloth. On examining the other part that was uncovered I found the skin of colour which composed the picture to be all cracked into little squares of about the eighteenth of an inch over, which were, for the most part, in their edges, loosened from the wall and curling up; however, nothing was materially lost. I saw that the picture had been formerly repaired in some few places, yet, as this was not much, and as the other parts were untouched, there was nothing to complain of. The wonderful truth and variety of the expressions, so well described by Vasari and Rubens, and the admirable finesse of finish and relievo taken notice of by Armenini, were still remaining. Whilst I was examining this part of the picture, two gentlemen came up the scaffold and drew aside the cloth which covered the other half, which, to my great horror and astonishment, was repainted. One of those men seemed to be at great pains to show the vast improvements the picture was receiving by this repainting; but the repainting and the discourse so kindled my indignation,

that I was no longer master of myself. "What, sir," said I, "is it possible that you do not perceive how this painter, if I can call him a painter, has destroyed the picture in every part on which he has laid his stupid hands? Do not you see that this head is distorted and out of drawing; that there is no longer significance or expression in it, that all his colouring is crude and wants accord? Do, sir, open your eyes, and compare it with the other half of the picture, which he has not as yet buried under his wretched colours?" He answered me that this was only a dead colour, and the painter was to go over it a second time. "Oh, confusion," said I, "so much the worse; if he has thus lost his way whilst he was immediately going over the lines and colours of Leonardo's work, what will become of him when he has no longer any guide, and is left blind and abandoned to his own ignorance?" And turning myself to two friars of the convent who stood by, "Fathers," said I, "this picture and the painter of it has suffered much by the ignorance of your order. It was whitewashed over some years ago, it has been again hurt in washing off the white, and now you have got a beast to paint another picture upon it who knows no more of the matter than you do yourselves; there was no occasion for thus covering it over with new colours, it might be easily secured in those parts that are loosening from the wall, and it would stand probably as long as your order will." The friar told me that he did not understand those matters, and that he spoke but very little Italian, that he was Irish, and that it was by the order of the Count de Firmian, who was Secretary of State, that this picture was repainted, and that the convent had no authority and had given no order for it. "Indeed, then, countryman," said I, "the world will be very little obliged to Count Firmian; it were to be wished and it will be for the interest and honour of your convent, if you can prevail upon the Count to spare, at least, what is remaining of the picture, and take down the scaffold immediately."

Vignola.

PROFESSOR COCKERELL.

Vignola has been deservedly regarded as a master of the first merit, and has been hitherto the great authority in the French school, as Palladio has been of the English. His stereotomy, profile, proportion, and composition are admirable; his orders are generally subordinate, often at the top of his buildings—they are never coupled as in Bramante and Raphael, but he reconciles the wide intercolumniation by a panel which gives proportion and sustains the pilaster with excellent effect. This expedient, much followed in Italy and in France, was original with him, as was also his modillion cornice, extending to the frieze, and giving extent and importance to the entablature, proportioned to the whole height of the building, in a better mode than that of Peruzzi. This beautiful invention is recommended without ostentation:—"Questa cornice," says he, "la quale ho mesa più volte in opera per finimento di facciate, ho conosciuto che riesce molto grata." This cornice was made the termination of the fabric, on which he never permitted a blocking or balustrade. But Vignola was chiefly remarkable for an artifice of composition, which, by subordinating the parts, gave apparent vastness to the whole. His doors and windows are remarkably small, the latter 3 feet 8 inches by 7 feet only in Capralola—but, being finely proportioned and complete in their members, deceive the spectator into the belief of actual scale. This artifice has been much used by his successors, especially in the upper portions of churches, with good effect, where no means of comparison or admeasurement are offered, just as a man becomes a giant when seen upon a hill and against the clouds.

St. Mary Overy, Southwark.

SIR G. G. SCOTT.

When I first knew this church the whole of it was standing: externally, it is true, the aspect it presented was not very pleasing, for it had been cased almost throughout with red brick, and the lady chapel was little else than a ruin. The choir was then in course of restoration. The interior was a most noble structure, and was almost perfect, and nearly all of this century, though some small portions westward were earlier, and the south transept possibly a little later. The whole was on a very symmetrical design, that of the nave being very much on the same with the choir. Its character may easily be judged of from what remains. It was nobly massive and grand, not of lofty proportions, but still such as to satisfy the eye. The pillars were alternately round and canted squares, flanked with attached shafts, the triforium consisting of arcades, interrupted only by the vaulting shafts. At the east end is a beautiful lady chapel, vaulted on light clustered pillars. The restoration of the choir was carried out by the late Mr. George Gwilt, aided by his sons, and it is impossible too warmly to praise the zeal and ardour with which they pursued the work, their study of the style then so little understood, or the untiring pains they took to render their restoration accurate. All these ardent lovers of ancient art are now deceased, and I feel a melancholy pleasure in bearing witness to their merits. I was intimately acquainted with one of the sons, and never did I meet a man more enthusiastically devoted to the style on which his artistic education had been founded. He absolutely adored everything which was Early English, and in carrying out restorations—in one of which he aided me—so faithfully did he reproduce the whole work, that nothing could induce him to alter even the positions of the jointing of the ashlar work. The pains which Mr. Gwilt took in restoring the choir disgusted the heartless parishioners, who, on proceeding to the transepts, placed the work in other hands; but on the lady chapel being undertaken by private individuals, Mr. Gwilt nobly undertook the work gratuitously, and carried it out with the same care he had bestowed on the choir. Shortly after this a report having arisen that the nave roof was decayed, a surveyor was employed to examine it, who, recklessly condemning it as unsafe, it was taken off, and none put on in its place. The walls, being of chalk, became shattered by exposure to the frost of several winters, and when the restoration of the nave was proposed to the parishioners, that enlightened body of men negatived it, and taking down the glorious old structure, erected the present monstrosity in its place. Happily, however, the interiors of the choir and lady chapel are still perfect. Let us hope and pray that their widowhood may not be of much longer duration, but that a reproduction of the noble nave may be substituted for its unworthy supplanter. I should mention that the nave was entered on the south side by a very noble double doorway, of great height and depth, though when I knew it its decorative features had perished.

Prototypes of Hollow Beams in Nature.

EDWIN CLARK.

We have many instances, in the vegetable kingdom, of the extreme rigidity and strength of circular tubes: the stems of the grass tribe generally are remarkable for their lightness and strength; the common wheat-straw and the river reed are familiar examples in our own climate; but in the tropics the gigantic stems of the bamboo and other grasses tower 60 feet above the jungle, and are extensively employed as beams for covering buildings, and even, in some cases, as the transverse bearers of light suspension bridges. The angler's bamboo rod is the most perfect of tubular beams. Tapered off in proportion to the strain, its silicious coat (as in all the grasses) defies compression, while it is internally lined with woody fire to resist extension in every direction. Its strength, lightness, and stiffness are thus equally marvellous, and we cannot fail to be struck with the provision of diaphragms throughout the whole tribe, to preserve the circular form, which addition would certainly have much modified the results obtained from thin circular and elliptical tubes of wrought iron. The bones of animals are oval, the depth being always in the direction of the transverse strain. But the more special province of the bones appears to be their action as pillars or struts, in forming immovable fulcra for the reaction of the muscles; and since any yielding would involve a great increase of motion in the muscle itself, we find bone among the most incompressible of known substances. The square form of stem characterises a very extensive natural family of plants—the labiate tribe, of which the beautiful dead nettle of the hedgerows is an example, though it is difficult to assign any mechanical reason for this peculiarity, which appears rather to be typical of the general development of these plants. But in the feather-bearing part of the ordinary quill we have a most remarkable example of the strength of the rectangular form. Here, again, every dimension is tapered down in proportion to the strain, with an accuracy defying all analysis; the extended and compressed portions are composed of a horny substance of prodigious strength, though extremely light and elastic. The beam is not hollow, but to preserve its form it is filled with a pithy substance which replaces the clumsy gusset pieces and angle-irons of the tube without interfering with its pliability. The square shaft is peculiarly available for the attachment of the deep vanes which form the feather, and, as the angular form would lacerate its active bearer, an exquisite transition to the circular quill at the base is another striking emblem of perfection. The imitation of such mechanics, so wonderfully adapted to such a medium, appears hopeless; but we are indebted to the flying philosopher, if his attempt only calls attention to such design, and induces us instructively to contemplate the beauty of a feather.

Roman Tesselated Pavements.

F. O. WARD.

The materials of the best and costliest pavements at Rome (such, for example, as those still remaining in the baths of Caracalla) are coloured marbles of various kinds, differing considerably from each other in hardness and durability. The inferior pavements found scattered through Britain, France, and other parts of Europe, and along the northern coast of Africa, are usually made of such coloured stones as the neigh-

bourhood happened to supply, with the exception only of the red tesseræ, which are almost invariably of burnt clay. Thus in the celebrated Roman pavement which was discovered in 1793 at Woodchester, in Gloucestershire, the grey tesseræ are of blue lias found in the vale of Gloucester—the ash-coloured tesseræ of a similar kind of stone, often found in the same masses with the former—the dark brown of a gritty stone met with near Bristol and in the Forest of Dean—the light brown of a hard calcareous stone, occurring at Lypiat (two miles from the site of the pavement)—and the red tesseræ, as usual, of fine brick. These materials differ from each other in point of hardness even more than the coloured marbles of the costlier pavements at Rome; and it is evident that a surface composed of such heterogeneous materials must wear unequally at different parts, and ultimately fall into hollows wherever colours produced by the softer kinds of stone are employed. If this remark should be met by a reference to remains of ancient pavements discovered in this country after a lapse of sixteen centuries from their first construction, and still retaining a level unworn surface, it is obvious to reply that the mere length of their duration gives no force to the objection, seeing that, during by far the greater portion of the time, these pavements have lain buried; and further that even when in use they formed floors to the baths and best chambers of the residences of Roman provincial governors, and were, therefore, doubtless, subject to very inconsiderable traffic. The entrance hall of a modern club-house would afford a much more trying test of durability; and it will hardly be disputed that a pavement composed of heterogeneous materials would in such a position be liable to wear unequally. The next point to be observed with reference to the Roman tesseræ is the want of uniformity in their size and shape, and the consequent irregularity of their junctures, especially in the more minute portions of the design. Whoever will take the trouble to examine the choicest specimens of old pavements at the British Museum (as, for example, one presented by Mr. Lysons, which formed part of the Woodchester pavement referred to above) will perceive that the tesseræ, instead of coming into contact by smoothly ground and equal sides, are in many places separated by broad uneven lines of cement. In some parts the intervals are of such width that the cement, which in a good pavement should be scarcely seen, forms at least a fourth of the visible surface.

Modern Architecture in Germany.

F. Eisenlohr.

The present age is engaged in seeking a something which at present does not exist, viz., unity in a sort of universal architecture. It seems to me that no immediate and direct imitation in any style of architecture already existing, complete in itself, will lead to the desired result as long as the present age demands its rights, and the existing state of society requires something arising more from its own nature. When I consider also that hitherto in our art we have acted in a manner too little abstractive and scientific, and have imitated too much, still, on the other hand, it is not to be denied that we cannot and ought not to disregard history and its effects, that we must have some point in history at which to begin, a root from which a new stem may shoot up into blossom as from the soil of the present. It is quite clear that here also theory and history must go hand in hand, whereby we must with consciousness attain to that new and unprejudiced position which, in childlike innocence, unconsciously existed at the commencement of all previous epochs in art. The difference between our age and its problem, as regards architecture, and indeed every branch of the arts, consists in this, that we ought to strive, so to say, with manly innocence, with manly knowledge and power, to attain to that point at which former periods in art have in their infancy begun of their own accord. Where there is nothing but an empty and groundless adherence to forms, where architectural fallacy and pretension, or a certain coquetry is manifested, there an art of a peculiarly creative nature can never be looked for. It is true that many grand buildings have recently been erected in the Roman, Grecian, and so-called Byzantine and Gothic styles, as, for instance, particularly at Munich. But they all want the enlivening principle of belonging to the present, and are only silent records of bygone styles of architecture. In the same way that we collect pictures of different schools in galleries, so King Louis has collected buildings of all possible periods; and as he had not got them at Munich, neither could he transport them thence from other parts; he had them built, and thus made a grand collection of buildings at Munich, but which is still deficient in historical authority. If, therefore, we would draw a comparison we must say that the modern collection of buildings at Munich is, as far as regards the arts, worth about as much as a picture gallery containing a number of more or less successful copies from different masters and schools. If it be true that the spirit of the times is truly expressed in its buildings, that the architecture of every period is, as it were, a fossilised history, future generations will say that the present period was utterly devoid of character. By means of a more intimate acquaintance with the history of architecture we have been provided with a vast quantity of subject matter, which has hitherto quite overwhelmed us from its variety and quantity, so that we were quite robbed of our senses. Of this we must first get the mastery, and impelled by a careful observance, as well as by an artistical and inventive spirit, regain our consciousness, without at the same time suffering the experience of history to remain useless. We must, on the one hand, investigate from a theoretical and scientific position how far our architecture and its elements answer to the conditions of its purpose, of the building materials, climates, and so forth; and must, on the other hand, in looking back upon history, endeavour to find some point which presents constructions and forms similar to those which result from our abstract investigations, and thus a fruitful germ may be found for a modern and, in itself, harmonious style of architecture—a style which would gradually come into general use, and supersede all the lifeless imitations and mere whimsical changes of fashion. In this, it appears to me, consists the great architectural problem of the present age, which can only be solved by united efforts.

Flint Walls in France.

J. H. Parker.

Walls faced with flints, cut or split, which are common in some parts of England (especially in the low countries and chalk districts where stone is scarce), are seldom found in France. There is an example at Bec, where it is used in the form of patterns and inscriptions, but this is the only one that has been observed. At a later period in some districts flint facings are frequently used in squares, alternately with black and white stone like a chess-board, and called "checquers" in the same manner as in some parts of England.

The Foundations of the Dublin Custom House.

J. Gandon.

As the ground altered in its texture towards the river, becoming more loose, with small sandy gravel, like that of the south-west angle, to which depth we had sunk, we deemed it prudent to bore it in several places which were near the angles of the front of the portico, but particularly where the walls of the cupola were to be erected, to the depth of 8 feet below the then surface, and it appeared to be much of the same substance as that already described. A pile 10 feet long and 1 foot square was driven down in the centre to 9 feet depth; but after twenty strokes of the ram it could be driven no further, which assured us that we had got to the firm ground. Upon consulting with the principal artificers on the spot, it was thought advisable to desist from sinking any more, but to make an artificial foundation, in order to sustain the great weight of the cupola; but whether by piling or otherwise was submitted wholly for my consideration. This part of the work had long occupied my thoughts, and to it I had given every attention, my conjectures having led me to expect great difficulties on this subject. I had nearly made up my mind as to the means I should adopt, and was the more strongly confirmed in my intentions, having remarked a circumstance which escaped the notice of those around me. Immediately after the pile had been driven I perceived a small stream of water arising up close all around it, as if it had pierced a spring; and recollecting an observation in Labelye's account of Westminster Bridge, "that piles sometimes loosen and open fresh springs, which often make it very difficult to get rid of the water," I was now apprehensive of just such an impediment. The great expense of preparing the piles, and the very long time it would take to drive so great a number as would be required, presented a strong objection to the use of them. I therefore gave directions to have a grating of Memel timber prepared, the timber to be one foot square, to have the upper ones notched down 3 inches in the ground pieces, which were to be bedded on a layer of cut heath, the whole ground being first correctly levelled; the interstices of the grating to be filled in with hard sound stock bricks, up to the level of the timbers, swimming in mortar composed of pounded roach lime and mortar well mixed, which answered nearly as well as tarras, over which was laid 4-inch fir plank fastened down on the grating with oak trennels, which was all completed. The foundation walls were then set out on September 17. The part directly under the cupola was laid with rough blocks of mountain granite in regular courses; in the first course was sunk an iron chain of flat bar, 4 inches wide and 2½ inches thick, into collars which were run with lead, but the bars were only covered with a cement of wax, resin, and stone dust. The rest of the foundation was done with the usual black stone, and was carried up to the plinth by October 16, 1782, thereby completing the whole of the foundations in one year and four months from the opening of the ground.

The Severn Tunnel is to be opened for traffic on September 1.

NOTES AND COMMENTS.

IF the collection of paintings in the Louvre can be said to have a defect, it is in the insufficiency of works belonging to the English school. During the last Empire much might have been done to supply what is needful to support the claim of the museum to be called universal. M. DE TANZIA, the Conservator of Paintings, has lately added one work—a portrait by RAEBURN—which was acquired at a sale in Paris for about one hundred pounds. It will form a pendant to the portrait by LAWRENCE, which is one of the works most admired by amateurs for dignity and brilliancy. We hope that a long time is not to elapse again before another picture by an English master is acquired by the French Government.

M. JULES COMTE, Inspector-General of the French Art Schools, has been appointed director of civil buildings and national palaces in succession to M. POULEN, who was connected with that department for nearly forty years. M. COMTE is known as an art critic, and he was the projector of the series of manuals known as the Bibliothèque de l'Enseignement des Beaux-Arts.

THERE were many interesting places besides Chester to occupy the attention of members during the meeting of the Royal Archæological Institute. At Carnarvon Castle the Deputy-Constable, Sir LLEWELLYN TURNER, gave the visitors an abstract of his study of the building. He set aside the theory that the first Prince of WALES was not born in a room in one of the great towers. Sir LLEWELLYN said that the tower was the most eligible place for the birth to take place, as before any invading host could get there they would have to fight the whole length of the castle, and in a case of emergency Queen ELEANOR might have been able to escape by means of a ship at the bottom of the staircase —the sea in olden time coming up to that spot. Sir LLEWELLYN TURNER, with his chief mason, JOHN JONES, have done much for the conservation of the historic pile. In Eaton Hall a building of a different class was opened to the members, and there was but one opinion about the architecture of the mansion and the beauty of the decorations. A third interesting secular building was Hawarden Castle, where Mr. W. H. GLADSTONE assumed the office of guide. When visiting the churches of the district the party had the advantage of the knowledge acquired by Mr. R. P. PULLAN, who also read an essay on "The Discovery of the Artemisium at Memi." The whole week was one to be remembered.

IN order to insure a reverential reproduction, the French Government have long restricted the performance of the "classical drama" in Paris to the Théâtre Français and the Odéon. But the rule does not prevent either theatre from taking liberties with foreign masterpieces. It will scarcely be credited that the only version of "Hamlet" which has been seen on the stage of the Théâtre Français is that of DUCIS, where everything is turned topsy-turvey in a surprising way. Finally, HAMLET becomes King of Denmark:—

> Mais je suis homme et roi : reservé pour souffrir
> Je saurai vivre encor ; je fais plus que mourir.

The brave ALEXANDRE DUMAS appreciated SHAKESPEARE more truly than any of his countrymen, and, with the aid of M. PAUL MEURICE, he produced a version of the tragedy that kept fairly close to the original. But no Paris manager would make the experiment of representing it, and the play had to be tried in the Saint-Germain Theatre. M. CLARETIE, the new administrator of the Théâtre Français, takes a broad view of his duties, and the version of DUMAS and MEURICE is now being rehearsed. The caste is arranged. M. MOUNET-SULLY will be HAMLET, which he is likely to play well. His defects will serve him, for his inequality (arising from the extent to which he is mastered by emotions) may suggest HAMLET'S twofold nature. M. GOT, the *doyen* of the company, is to be POLONIUS, and we hope he will depart from the English routine and remember that the chamberlain was a gentleman. M. MAUBANT, the last of the old school of tragedians, assumes the part of the Ghost. M. SILVAIN, who is an admirable and genial actor, will be King, and he had also better forget the English tradition, which declines to recognise that CLAUDIUS had witchcraft of wit. M. COQUELIN the Younger is First Gravedigger, and the speech of the First Player is sure to be given with declamatory power by M. DUPONT-VERNON, one of the actors who are kept down in the theatre. Mdlle. REICHEMBERG will be OPHELIA, and Mdme. AGAR—a late addition—takes the exacting part of GERTRUDE. The costumes are to be designed by M. BIANCHINI, who has a reputation for work of the kind; and it deserves to be noted that M. AMBROISE THOMAS, the composer, has composed music for the snatches of old ballads sung by OPHELIA and the Gravedigger. During the performance the curtain will not be lowered—an arrangement that is sometimes adopted with the old French tragedies. We hope the experiment may be more successful than the Porte St.-Martin's "Hamlet" in the early part of the year.

THE report by Mr. J. A. CROWE, of the Paris Embassy, on commercial museums in France, gives some information about industrial designs. In Lyons, for example, there are specimens of all the best designs for textiles created in past centuries, and these are not only choice but abundant and much consulted. Yet practically textile designs are not made in Lyons but in Paris, and commercial men and manufacturers seem not to feel the want of a commercial museum at all. If one asks why this is so, the answer is that in spite of schools and museums and in spite of tradition, which favours the weavers, Lyons designers only get good ideas if they go to Paris, and after they leave that capital they rapidly become exhausted, and are obliged to return thither for fresh artistic inspiration. In the Rouen Museum (Rue St. Lô) there are a great many volumes of stuffs and patterns, which are of great interest to the designer and historian of art. But the Société Industrielle have what is supposed to be better for the manufacturer, viz., an abundant supply of cuttings of Lyons silks, St. Etienne ribbons, and Alsace prints, besides other articles of less importance of French manufacture, all of the spring season, 1886; not exhaustive nor perhaps of sufficient size, not comprising any registered patterns probably, but being such as might be brought together, for example, by a private firm like that of Messrs. CLAUDE, of Paris, who, it is said, contract to deliver the patterns of novelties of a season for sums varying from 35*l.* to 80*l.* a year. There are about 800 subscribers to the society, most of whom are residents at Rouen, but not a few are foreigners, who, on payment of 20 frs. a year, enjoy the privilege of receiving the bulletins or transactions, and the right to take home and copy from volumes of samples. The general public can only come in as visitors, and not as copyists. It is the rule when the novelties of one season are superseded by those of another season, that the older samples are taken out of the frames where they were displayed, and mounted in volumes, which thus form a valuable set of archives.

THE systematic way in which the Germans endeavour to understand foreign markets is seen from an exhibition which has just been held in Coburg. With the view of ascertaining the class of European articles most in favour and commanding the readiest sale in the Chinese markets, the German Consular authorities in Canton and elsewhere were instructed to purchase on the spot, and send home, specimens of European goods of every nature, forming the staple commodities most in vogue, together with observations based on local knowledge as to the marks, mode of packing, and other minutiæ which specially induced the Chinese purchaser to favour one class of goods more than another. The people appear to have peculiar fancies which must be humoured by Western traders. Thus, for example, much depends on whether goods are wrapped in blue or red paper, or fastened with a black or white cord. Chinese purchasers regard any goods wrapped round in an unaccustomed manner, or with a hitherto-unknown mark, with great suspicion, and are apt to condemn such goods as valueless without trial. On the other hand, whenever they recognise on a bale of goods a familiar mark and the accustomed wrappings, they never think of examining it, or measuring it before purchase.

ILLUSTRATIONS.

THE LIBYAN SIBYL.

AMONG the plates which appear in *L'Art* the great Italian masters are not overlooked. We give this week one of the *Sistine Sibyls*. It will be seen that M. Didier has done justice to the largeness of style that characterises the original, and that in this case there is no evading the difficulties offered by the hands and feet.

ARCHITECTURAL ILLUSTRATION SOCIETY.

NO. 18. S.E. VIEW OF ST. MICHAEL'S, BOURNEMOUTH.
Mr. R. Norman Shaw, R.A., Architect.

CATHEDRAL OF NOTRE DAME, BOULOGNE.

THE Cathedral of Notre Dame at Boulogne is a prominent mark when seen from land or sea. The dome has been stilted for that purpose, and there is no doubt that the designer's object is fully attained. The building is about sixty years old. Our illustration is taken from a fine water-colour drawing by Mr. R. J. Cornewall Jones, architect, which was exhibited this year at the Royal Academy.

EDINBURGH MUNICIPAL BUILDINGS.

IT will be seen from the advertisement in *The Architect* that the magistrates and council of Edinburgh have instituted a competition for the proposed municipal buildings, and invite architects to send in designs before the last day of the present year.

Three premiums are offered, viz. 250*l*., 150*l*., and 100*l*. It is not, however, guaranteed that the author of the first premiated design shall have the carrying out of his own work, as the authorities reserve the right to employ any architect they think proper for that purpose. The site which the new buildings are to occupy is that on which the present City Chambers stand, with the adjoining property.

The conditions specify that each design must be illustrated by geometrical drawings of the plan of each floor and of the roofs; the elevation of each external façade; one longitudinal and one transverse section, showing the façades of the internal court or courts; a block plan, showing the proposed buildings with reference to the adjacent streets and houses, and detail drawings of the principal features of the design. Further, each competitor is to submit a probable estimate of the cost of the entire structure according to his design, and it is stated that the element of cost must form an important consideration in judging of the merits of the designs. It is laid down that the main staircases, corridors, and internal spaces must be of ample though not excessive dimensions, and the courts, rooms, staircases, and corridors must have lofty ceilings and be well lighted and ventilated. All external façades and those to the courts are to be of stone, the floors of fireproof construction, the roofs to have their constructive portions in iron, while the stairs are to be of stone. Ample lavatory accommodation, thoroughly ventilated and on the most approved sanitary principles has to be provided, as also a pair of passenger elevators and a hoist for lifting coals from the level of Cockburn Street up to the highest floor.

In the indication of general requirements it is stated that the town clerk's, chamberlain's, collector's, and Water Trust offices should be specially easy of public access from the High Street level; that the burgh court-room should be on the same level, that the collector's office should be arranged with reference to the special requirements of the public, who come in large numbers at a certain period of the year to pay their rates; that the offices for the inspectors of gas meters and of weights and measures should be on the lowest floor entering off Cockburn Street; and that each department should have in direct communication with it a safe for books. In the part of the building above the offices a library and museum, it is suggested, might be introduced; also rooms for the housekeepers. The Clydesdale Bank branch office occupies, it is stated, an important position in the front part of the existing building, and it is proposed to provide accommodation of at least equal extent for it in a similar position in the new building.

A separate schedule gives approximately the amount of floor space required for the different offices. This schedule shows that it is desired to make the public office of the burgh assessor the largest within the buildings. Its area in superficial feet is given at 1,500. The council room ranks next in size, with an area of 1,300 superficial feet; while for the public office of the collector of police a superficial area of 1,200 feet is wanted. The desired area of the burgh court room is set down at 1,000 feet, and so is that of the city chamberlain's public office. Among the other approximate areas are—Dean of Guild court-room, 816 feet; public office of the superintendent of works, 600 feet; Water Trust public office, 700 feet; burgh engineer's public office, 550 feet; public office of the Heriot Trust, 400 feet. It is estimated that the building should contain an internal available space for rooms of 36,095 superficial feet, divided as follows among the different departments which would be housed in it:—Council and committee-rooms, 4,320 feet; town clerk, 2,270 feet; city chamberlain, 2,390 feet; burgh court, &c., 3,010; procurator-fiscal, 1,250; Dean of Guild court, 1,371; superintendent of works, 1,120; head gardener, 180; Water Trust, 2,250; collector of police, 2,300; burgh engineer, 1,634; medical officer of health, 760; burgh assessor, 2,400; city roads department, 1,320; Heriot Trust, 1,900; weights and measures office, 1,370; gas meter inspector, 1,100; Clydesdale Bank, 1,200; registrars' offices, 3,500; officer's room, 350; porter's lodge, 100.

All canvassing of the magistrates and council or of their assessors in favour of any particular design is not to be admissible. After the prize award has been made public, the magistrates and council take power publicly to exhibit all the designs.

THE RESTORATION OF THE DUCAL PALACE, VENICE.

IT is many years, says a correspondent of the *Times*, since anyone saw the Ducal Palace free from hoarding, and it will be two years more before it will be seen so again. But, at last, the entire façade towards the Piazza, from the Porta della Carta to the fifth arch beyond the south-west angle (with group of *Adam and Eve*), has been completely restored and freed from scaffolding and repairers. Of course, like those on St. Mark's, the restorations have caused great outcry and much protest. Of their necessity anyone may still satisfy himself by examination of the unrestored part of the upper arcade on the canal side, between the repaired portion at the angle and the works now going on to repair substantially the damage caused by the conflagration of 1577, after which the five arches next the angle of the Porta della Paglia were filled up with masonry by Antonio della Ponte to prevent the fall of the whole structure, or its demolition, according to the advice of the other architects, and its reconstruction in a Renaissance style.

The necessity of the repairs which have been going on for so many years arose in part from the defective construction of the original work, but much more from the ruinous manner of making repairs. As in St. Mark's, the south-west angle was the worst damaged by weather and time; but many of the arches of both storeys and the capitals almost without exception were giving way more or less, and the former method of applying the iron rods which were expected to hold the broken capitals in place or prevent the columns from yielding to the outward pressure was such that it often increased the damage. Almost all the capitals still remaining are split by the insertion of the iron bar which was intended to keep them in position, and iron clamps introduced to prevent the capital separating more widely in some cases caused new and complicated fractures. The water standing under the bases of the columns had dissolved the stone in parts so as to throw the weight on one side of the base, whence splits in the columns, and every crack let in more water, which by corrosion and freezing carried on the destruction of the building. The Adam and Eve corner had reached that stage of decay that a relatively moderate shock of earthquake would have sent the whole angle of the building, from base to battlement, down into the Piazza, and, being in the greatest danger, the repairs began there, and then were carried on to the Porta della Carta; the arcade was shored up, all the defective stones of arch, capital, or column removed, where defects could be repaired they were restored, and where too far broken replaced by new ones. Where, as in many cases, the capital was simply split in two, the halves were cemented together, and a circular groove below and another above having been cut, a copper ring was fitted to it, and, after a leaden lining had been placed in the groove with cement, the copper was heated and shrunk into its place, the lead and cement preventing unequal pressure and excluding water absolutely. The bases of the columns of the upper arcade had, with few exceptions, yielded to the pressure, and were entirely unserviceable. These had been, in the restoration, cut from the same block of marble as the cornice (on which, in the former construction, it rested); and in the corner columns, where the pressure is greater, the frieze was also made in the same block, so that these three blocks of marble are replaced by one.

Where capitals were so crushed as to be irreparable—

and I saw one broken into more than thirty pieces—they were put together carefully and a plaster cast made from them, and this copied by a competent sculptor, each one of the lower capitals occupying one man from eighteen months to two years. On the lower arcade, now restored, the number of the old and new capitals is nearly equal; and I defy any person not an expert in restoration to distinguish the new from the old by the quality of workmanship or the appearance of age. I failed entirely to select a single one, so perfectly had the appearance of age been imitated. The capitals removed go into the museum. The examination of the iron braces which have been extracted from the broken capitals shows that in some cases the rust on each side of what remains of the bar is equal in thickness to the remnant of the solid metal; and many of these braces were so reduced by oxidation that they no longer were fit to bear a strain even a fraction of that which a slight movement of any part of the subsoil might cause. Thirteen of the capitals of the southern façade in the upper arcade were poor restorations of the sixteenth century, and repairs seem to have been as regularly or irregularly successive from the time of the completion of the palace in A.D. 1463 or 1464, as construction and alteration were from the ninth century (when the earliest palace, of which the tower near the Porta della Carta was probably part) down to the completion of the palace as we now have it.

Through the whole of the work so far done in the present restoration every defective stone has been removed from its place—if plain, a new one substituted, if sculptured, returned after repair, if capable of repair, and no capital has been rejected except for imperious statical reasons. The iron braces or strengthening rods, instead of being put through the capital, are inserted in the foot of the arch above it; and this, after the arch is *in situ*, by boring in and inserting a bronze socket, into which the iron bar is screwed, so that if at any future time it becomes defective it can be removed, and all iron which is placed in contact with the stone is tinned.

The workmen have just now replaced the stones of the south-east corner, that over the Ponte della Paglia, and the day before yesterday I saw the triple stone, the base, cornice, and frieze of the corner column of the upper arcade in its place, and yesterday the column restored to its old position—being still serviceable. Work is at the same time going on on the five filled-up arches, the stones cracked by fire and water being replaced, and the arches reconstructed; and when this is done the filling-in of Antonio della Ponte will be removed, and the façade restored to the condition in which it was prior to the conflagration. The entire work is to be concluded in about two years, and will then be more solid than when first constructed, and will be good for centuries, barring accidents.

It has been to me a great pleasure to be admitted so freely into the works and allowed to follow every step of the progress of restoration, and the opportunity of making the acquaintance of Master Luigi Vendrasco, charged with the direct supervision of all the work—a splendid example of the master-workman, no degenerate successor to the *maestri* of four centuries ago, if one may judge from his work as well as his personality—has been most instructive to me, and for his technical history of the palace I am for ever indebted. To the architect-in-chief, Forcellini, and his assistant, Boni, I am under obligation for unmeasured courtesy and indulgence. Boni's studies on the materials and foundations of Venetian buildings are probably known to English architects, and throw strong light on the state of the arts in the best days of Venetian architecture. And here I may say that the whole official world in Italy connected with the Department of Antiquities, from Senator Fiorelli and his *sostituto*, Professor Felice Barnabei, to the architects in charge, have, so far as I can see, merited nothing but eulogium for their zeal in the preservation of everything of early work that is capable of preservation, and the thoughtless strictures on the restorations of Venice would never have been made by men who had taken the pains to examine the work as I have. Whenever, in my visits to the Italian cities, I have found a case of neglect or maltreatment of any ancient structure, a word to Professor Barnabei has set matters right at once. Generations to come will have cause to thank the present Department of Antiquities at Rome for the pleasure which the sight of the most beautiful structures of Italy can give, and all I can say in grateful recognition is less than it deserves.

The last three centuries of unintelligent and often unconscientious repairs have left a difficult task for restorers who wish to preserve the work of the good epoch, for it is often disfigured almost beyond recognition; but the public interested in old Italian architecture may be assured that whatever traces of it may still exist will only be dealt with as the necessities of structural permanence require. And I say this having just visited Orvieto, Prato, Florence, Verona, and various places of minor importance in the history of art. Vague and general denunciation is out of place; but I am sure that any responsible intelligent indication of injury being done to any monument of antiquity in Italy given to the department of Senator Fiorelli will receive instant attention, as I have proved in one case since I have come here, and as was shown when the renovation—*i.e.*, scraping and rechiselling—of the Duomo in Florence was attempted a few years ago.

THE ROYAL ACADEMY.

THE following letters from Academicians on the subject of the letter signed by Mr. Holman Hunt, Mr. Walter Crane, and Mr. Clausen have appeared in the *Times*. The first is from an anonymous Academician, who says:—

As the recent decision of the Royal Academy in regard to their exhibition has been the subject of comment in the press, I will ask to be allowed space in your columns to correct some misconceptions which are afloat regarding it, and to say that the explanation of that decision is to be found in the belief held by a large majority of Academicians that the proposals before them were adverse to the public interests.

That the vote could not have been due to selfish motives a reference to our catalogues will show, as it will there be found that a largely preponderating number of Academicians, whether from interest or convenience, do as a matter of fact confine their contributions within the limitation which was then proposed, and were therefore dispassionate in their judgment of the question as it affected the welfare of the institution committed to their charge. That question was whether the proposed limitation of contributions would lower the quality and attractiveness of our exhibitions, the profits from which are our sole revenue for carrying on the public work of the institution.

There was no thought or pretence that the exhibitions would benefit by the change, and those who advocated the measure had to be contented with arguing that the result would be less disastrous than its opponents anticipated. This damning with faint praise was in itself a sufficient justification for the rejection of the proposal.

Unlike your three correspondents who desire, for its own sake, a "National Exhibition of Art in England," enabling artists to exhibit their productions at the expense of the taxpayers, the sovereign founder of the Royal Academy designed that its exhibitions should give the means for carrying out two further objects which he had in view, viz., a school of art free to his subjects, and the bestowing of benevolences upon artists and their families. This design has certainly been justified by its success, and the Royal Academy is entitled to point to the wide-spreading tree which under its fostering care has grown from the acorn planted by the King as a proof that the body has shown itself deserving of the trust which was placed in it. The schools, which, since their foundation, have given to the country most of its chief artists, are now maintained on a vastly increased scale at the cost of several thousands of pounds annually; the benevolences have increased in the same way, with the result that our expenditure on public work has been stretched to the very extreme of prudence. It is evident that at such a time the Academicians are more than ever bound to be jealous of any tampering with the source of their revenue, and I am sure the general public, when it realises that in defending our trust and in refusing to bar works more worthy of exhibition to make space for those which are less so, we are first and foremost consulting their interest, will be disposed rather to praise than to censure us for our present action. But while in guarding our trust we find ourselves charged with closing our doors against our brother artists, no account is taken of the exhibition space that has been obtained through that guardianship, nor is the public told that for every non-member who had accommodation in the early years of the Royal Academy ten are received at the present time, and that we have exhibited the works of 1,200 artists who are not members of the body.

The great expansion of our exhibitions, schools, benevolences, and hospitalities has been brought about without the Academy receiving one shilling of public money (the site of Burlington House having been given to remove from the nation the lien of the King's gift to the Academy), and is due not merely to good management, but to the unselfish way in which generations of Academicians have devoted themselves to the service of the institution, taking only a peppercorn scale of remuneration, and foregoing their rightful claims in this respect in order that the funds might increase and be used in extended operations. Like our predecessors, we of the present day have been called up to our posts from the ranks of the profession, and in those same ranks our successors are now to be found. Without doubt the public spirit of our artists, of which our institution is a monument, will not die out, and those who succeed us will act upon the traditions of their predecessors who built up the Academy. Let us hope that they will have some encouragement besides the lash, and that artists selected for their eminence and giving years of loyal service to the institution may not suffer from the bitter, cruel words which are

sometimes levelled against respected veterans of our own time.

From what I have said of the nature of the Academy's work it will be clear that it is for the interest of the public that a steady continuance of it should not be prejudiced by any financial difficulties, an eventuality which a want of strength in the exhibitions would most certainly bring about.

There is, however, no disguising the fact that danger is ahead, although exactly in the opposite direction to that from which the shouts come. Until lately the best artists of the country—who were members—gave their undivided aid to the exhibitions. Rivalry to the institution was made impossible, and, indeed, under no other conditions could its present financial position have been attained. Now it is otherwise. Great allurements are held out from other quarters, and eminent members of the Academy who may succumb to them are sure to find themselves applauded as men who do not take an undue advantage of their privileges, as though the question were not one of service to the institution rather than of privilege.

Already this dispersion has gone so far that of the nearly 2,000 works in our exhibition this year only 179 were contributed by the members of the body, and yet under these circumstances it is brought as a charge against us that we will not legislate to further reduce our numbers. As most of the driven off works would be welcomed elsewhere, we may fairly surmise that the attacks are not always above suspicion, and it has been my endeavour to place such facts before your readers as will enable them to test the quality of these attacks, which hitherto have remained unanswered and unexplained.

My colleagues will doubtless recognise who is the writer of this letter, but, as there is nothing in it of a personal bearing, I will not separate myself from the body with which I act, and will subscribe myself simply as "R.A."

II.

Mr. E. Armitage, commenting on the foregoing, writes :—

Your correspondent "R.A." pleads powerfully in favour of the past and present conduct of the Royal Academy, but seems to me to have avoided discussing the actual question at issue.

The real reform which is desired by the great mass of the profession does not at all affect the privileges of the Academicians. What non-members demand is the reduction from eight to three of the number of their own works permitted to be sent in for exhibition, allowing the members to retain their present privileges.

The object of this proposed alteration in the law is to reduce largely the total number of works sent in, and thereby to give the Committee of Selection more time for the consideration of each individual work, and therefore a better chance of coming to a just decision.

This simple reform would perfectly satisfy the profession generally. Of course, there are a few Anarchists or Nihilists in art as well as in politics, but these exceptional individuals are (like their political prototypes) either hopelessly visionary or savagely revolutionary, and their opinions may be safely ignored.

It will doubtless be asked, "Why, then, was such a modest and inoffensive petition not granted by the Academy?" The reasons were two in number, the first being that the reform in question was strongly and persistently urged by a portion of the press which has been notorious for its virulence against certain Grand Old Members, and, human nature being the same everywhere, the aforesaid Grand Old Members could not resist the temptation of crushing the buzzing fly which for some time had been teazing and goading the team of the Academic waggon. The second reason for rejecting the proposed reform was, to my mind, even less excusable than the first. It was contended by many of the members that whatever reduction might be agreed to respecting the intended exhibits of outsiders, the same reduction must be made respecting their own, strict equality having always been the law at the Royal Academy since George III. granted their charter. This sounds very fair; but how can there be anything like equality when every picture sent by a member must be hung, and every picture sent by a non-member may be rejected? The argument, to my thinking, is ludicrous, and reminds me of Dr. Johnson's

Who drives fat oxen should himself be fat.

However, this argument, fallacious as it is, had great weight with the majority, and the assembly, after negativing several proposed modifications of the scheme, decided to leave the rules unaltered.

I think I have shown that the question of reducing the number of works sent in by members is, in the eyes of the great body of artists, quite insignificant. It might, if carried, relieve the exhibition of perhaps half a dozen weak pictures, but at the same time it might banish fully that number of fine portraits to the walls of other exhibitions, and at the present day, with so many rivals in the field, we can ill afford to deprive our galleries of any of their attractions.

May I be permitted, before closing this letter, to say a word respecting a proposed national exhibition on the model of the Paris Salon? Those who talk glibly about the "liberté, égalité, et fraternité" of the Salon are entirely ignorant of the number of privileged exhibitors—that is, of exhibitors who are exempt from the jury—a number compared to which our privileged class sinks into insignificance. They seem to be equally ignorant of the jobbery and bribery which go on every year with the carpenters, who have practically the whole hanging entrusted to them. Members of the jury drop in occasionally to look after their friends, but this is about all they do. I am convinced that the Academy, with all its shortcomings (for I am not one of those who hold the venerable old Georgian corporation to be faultless), deals more fairly with art and artists than any other institution in Europe. Its decisions, as expressed by the Council, are often held up to scorn by the critics of the press, but I have yet to learn that these censors are more likely to form a sound judgment than the ten experienced artists who compose the Council.

III.

Mr. Holman Hunt, in reply to "R.A.," says :—

I will not presume to inquire who is the gentleman signing himself "R.A." in the *Times* of Saturday. The letter is, without doubt, sufficiently authoritative to be taken as representing the true sentiments of the majority of the Royal Academicians and Associates. I will beg you, therefore, kindly to allow me space to justify the trio who protest against the imperious position and course of the institution.

I thank the writer heartily for having so fully revealed the spirit of the body; without such explanation the dispute could not be understood by the public who are invited to judge the matter. The letter is one blast of infallibility from the first word to the last, varied only with regret that the sublime superiority of the genius of the body was ever allowed to shine outside the walls of Burlington House. The institution sprang perfect from the head of George III., perfect for all time (although then there were perhaps not five hundred artists in the whole of England, and now there are fifty times this number who profess the art of design). It is still absolutely what it should be, and the interests of the whole world of art may be left safely in the hands of its members, without care for the unreasonable malcontents; the schools are everything that could be desired, although they are producing thousands of students who, according to the showing of "R.A.," are undeserving of due opportunity to exhibit their works (with the exception of the infinitesimal number who are to be future members). Our difficulty might have been to account for the fact that because the Council rejected the petition of outsiders these last should forthwith invite combination for the establishment of a truly national institution. It might have needed much argument to account for the rebound to such an extreme measure, but the lofty tone of "R.A." will convince the world that no hope would be held out of reformation of the power which at present "stops the way" of English art. The question as to the number of works for a member to contribute has disappeared. This is now a past test case. We must look for a national school of art to ourselves alone. The distortion of our views in "R.A.'s" statement, that the money for such exhibition must come out of the pockets of the taxpayers, is a flight of genius, but it is too imaginative for the business-like world, and need not be answered.

Now, with the general ground better understood, let us proceed to details. "R.A." says that Burlington House was given in place of a lien on the benefactions of George III., but he does not say that it was given with conditions or recommendations which have never been observed.

He studiously ignores the pent up force of public opinion behind the Royal Commission, as did his predecessors, and, as he assures us, his successors will do. With the august honours he enjoys, he has forgotten the feelings of outsiders, and the power which they may exert if they will but be united. I will try to recall to his memory some of the facts of the date referred to. I can remember that in my evidence I had to prove my charge of injustice in the hanging of pictures of outsiders. I chose the case of F. Leighton, whose works had recently been placed most unworthily; and I added that one of the Royal Academicians had said in my hearing that if he had his will they should be put in still worse positions. Knowing that the gifted painter in question happily had means at his command to continue the struggle, and that he had openly declared his intention to avoid all opposition to authority, I added that in a short period the Academy would be obliged to elect him. At that time, the institution having elected Millais to the rank of A.R.A. while he was still very young, proved that it was from no appreciation of his genius, but only to break up the band of independent artists to which he belonged; for they kept him in the lower grade of honour while year after year they put very inferior men over his head; until it was known to

others, if not to them, that the future pride of their Academy had come nigh to a decision to leave them in all their narrow glory. At that time Watts had received nothing but contempt at their hands, Rossetti had been deterred from exhibiting altogether, Armstead, Woolner, Brett, Stacey Marks, Hodgson, and many others now in the Academy, and some still outside its walls (in fact, every one with new blood), were struggling against the hindrances which the ennobling for life of some of the most incapable of artists had occasioned. The decision which many of my friends had come to was to rely nothing at all upon the Royal Commission; we recognised that the Academy would find a way of evading all such recommendations as would detract from its power of usurping to itself all the influence, the glory, and the emoluments of the profession; and I was implored by certain of those whose names I give above to bind myself by honour to refuse all overtures from the institution. I had never made secret of my independence, but, on the contrary, only recently had obtained opportunity for exhibiting the rejected works of the victims of arbitrariness in the rooms of the Cosmopolitan Club, thus increasing my offence to the Academy. It was by this time convinced of the need of reducing the number of its opponents; and so, with knowledge of the feebleness of human nature to reject personal riches for the sake of public good, my fellows in revolt were invited separately to go over, and they all accepted without a moment's demur. The revolt, therefore, apparently did but little at the time, for with the new blood exactly the same traditions were kept up, and it was only when it was seen that Burne Jones could not be ruined by persistent opposition, that last year he was elected member of the body.

There has been but one principle adopted by the Academy during the whole of my experience. Over respectable nonentities there is no fighting. Why should there be? These are assiduous admirers, and are not dangerous. But towards young men with original force, of whatever form, everything is done by the Academy and its friends to make the struggle an impossible one. Painting and sculpture are very expensive professions. Without due recognition a man must give up the effort to do ambitious work. Some true men fall and disappear altogether; others take to very humble and private work, and the Academy says triumphantly, "Look at the glorious roll of genius we can show," implying that they have judiciously fostered all that the country has produced. Let me ask them, with all candid admiration for the great men they have had among them and still have, whether the infamous roll would not be appallingly long and hideous; whether the men comprising this last have not kept honest and noble artists from their best work and from a fair chance of gaining the wherewithal to live; whether the traditions of the Academy have not put their thoroughly incompetent members into posts which none who had not done the State due service should hold; whether they have not been appointed teachers of drawing without being in the slightest degree qualified for the office, greatly to the injury of the next generation of artists; whether the "benevolences" have not been given to these, to their widows and children, to the loss of more worthy claimants? I would ask also whether a truly strong man, who has been opposed and almost ruined until he is fifty years of age, has not often succumbed to the temptation to make the period of life that remains to him a means of enriching himself, rather than of doing what he might have done to raise public taste had his life been a calmer and more equal one, enabling him to work unhampered by daily cares and without temptation at the last to repeat himself *ad nauseam*, and thus to bring upon himself "the bitter cruel words" which "R.A." very properly reprobates as vulgarly inflicted upon veterans of the institution?

My conclusion is that as at present constituted the Royal Academy is a perpetual injury to art. It helps to dazzle the feeble judgments of the world as to what is true merit. As Hogarth said, when its establishment was contemplated, "More will flock to the study of art than what genius sends; the hope of profit or the thirst of distinction will induce parents to push their offspring into the lecture-room, and many will appear and few will be worthy." Of late the influence of the institution has silently been extended far beyond the bounds its founders ever contemplated. On continental great exhibitions it has its officers ready to enforce its judgment about the placing of the works of our country, and the prizes are given in exact order of Academy honour. In the colonies it exercises its influence, having—at least till lately—one of its members to choose works for their permanent galleries. In the provincial towns at home it controls the hanging of pictures, sending down one of its members to insure the placing of the Royal Academy works in posts of honour, and taking care to put the works of rebels in ignominious positions. Is it a wonder that few men dare to refuse its favours? or is it astonishing that with such protection it should be found that these often paralyse their recipients?

The remedy to be preferred (I speak here singly) would be to make the present institution thoroughly representative, with members elected from without by exhibitors of certain standing, each batch of members to remain in office for a fixed number o years, and on retiring to carry with them the title of honour o their service. The hanging I would have performed by a second representative body, elected for the year only, to relieve the first for other duties. The schools should be conducted by teachers, permanent so long as they were considered satisfactory by the existing body of control, who would strive to perfect the system of instruction, and thus render needless the exodus of students to Paris—this a most desirable point, because with the good so often obtained in France much evil is done to English taste in the contemplation of the sanguinary and brutal pictures of continental schools. There would be effort also made to honour those branches of English art which are now treated as though beneath national recognition. Effort also would be made to render every artist better acquainted with his materials, and better able to procure the soundest and best. Each party would strive to make its tenure of office compare nobly with that of other representatives, and so all would be living and healthy. The responsibility of refusing such a scheme will rest with the Royal Academy. I hereby make a last appeal to its members, so eager for reform before their election, to prove that their discontent was not only a selfish one. I will trust yet they may respond generously. But if the decision is made finally, as "R.A." would seem to say, we must turn to the realisation of the alternative opportunity declared in our joint letter—unless, indeed, Government will exercise its power to do what it can to save the existing institution from its internal foes, and to save English art itself, for both, indeed, are in imminent peril.

IV.

"R.A." replied in a second letter as follows:—

Mr. Holman Hunt, in his letter in the *Times* of to-day, writes:—"'R.A.' says that Burlington House was given in place of a lien on the benefactions of George III., but he does not say that it was given with conditions or recommendations which have never been observed."

As Mr. Holman Hunt has misunderstood what I did say I will ask you to allow me to give this further explanation on the subject referred to.

At the date of the foundation of the Royal Academy the old palace of Somerset House was the private property of George III., but subsequently the King parted with this property to the nation, subject to a reservation in favour of the institution he had recently founded. In accordance with the conditions of the conveyance, galleries and rooms were specially constructed for the Royal Academy in the new Somerset House (the present one), and in due course it was installed in the apartments appropriated to its use. At a later date, after permission had been asked of and granted by William IV., the Royal Academy accepted the rooms at Trafalgar Square in place of those at Somerset House; and lastly, received a site at Burlington House in compensation for the habitation at Trafalgar Square; thus, as I said in my letter, removing "from the nation the lien of the King's gift to the Academy."

It will thus be seen that the Royal Academy was founded by the King upon property which was his own. It was founded for public objects, which are defined in the instrument of our foundation; and in fearlessly claiming judgment upon the stewardship of its trust, the Royal Academy has to be tested by the objects thus defined, and not by the schemes of Mr. Hunt and his friends.

With regard to the "conditions or recommendations which," Mr. Holman Hunt says, "have never been observed," can he inform your readers what conditions laid down by Government have not been observed? Recommendations even endorsed by Government can scarcely be held in judgment over the institution.

THE SCIENCE AND ART DEPARTMENT SCHOOLS.

THE new Directory (revised to July) exhibits a few changes. The grants to a school will be so restricted in the future that the lien of the Department on fittings shall at no one time exceed 300*l.*, or that on apparatus and examples 200*l.* The scheme of local scholarships is extended "to enable the committee of the local fund to maintain the successful competitor while pursuing his studies for one, two, or three years," and the Department will supplement the local contributions of 5*l.* each year by grants of 4*l.* for the first, 7*l.* for the second, and 10*l.* for the third year; also, in connection with this, the restriction whereby payments on results cannot be made on account of the same student in the same year in more than three subjects, in addition to geometry and mathematics, is relaxed in the case of registered second year's students in organised science schools, in which case six subjects are allowed. An important change is announced with reference to the rewards to students, as it is now enacted that to be eligible for a Queen's prize "each of

such students must have received from a qualified teacher at least twenty lessons in each subject on account of success in which a prize is claimed since the last examination in that subject in which he was successful." It has hitherto been a grievance with science teachers that the Queen's prize could be won without any attendance at class. The Directory furnishes the conditions for obtaining the special scholarships and medals, as the Edward Forbes and the Murchison medal and prize; the Tyndall, Hodgkinson, and the Frank Hatton prize; and the De la Beche and the Bessemer medal.

Under the regulations special to art some modifications have been introduced. It has been arranged that lessons may not be registered in more than two groups of subjects for any students on any one day, except on Saturdays, when lessons in three subjects may be registered. And for the purpose of registration the groups are to be drawing (including freehand, geometry, model, perspective, outlining, and shading from the cast), architecture, theory and designing, painting, study of the figure, and modelling.

Several examination syllabuses are altered. In physics there is fuller treatment of sound, and in botany (both advanced and honours), the courses now include the study of the cryptogamia. In the principles of mining the syllabus has been completely recast. It is now very complete, including such subjects as mineral geology and geography, exploration, breaking ground, deep boring, opening ground, modes of working, ventilation, lighting (including use of the Fleuss apparatus), drawing and winding, drainage, and underground conveyance (including electric railways). In this revised syllabus, in addition to scientific accuracy, attention is to be paid to "orthography, composition, and writing," whilst "exactness will be expected in all that relates to numbers, dimensions, and weights, and as neat and accurate drawing as the time will permit."

THE WALLS OF CHESTER.

A PAPER was read by Mr. G. W. Shrubsole at the meeting of the Royal Archæological Institute, upon the age of the city walls of Chester. He said that Pennant had stated over a century ago that the form of the city evinced its Roman origin, but that no part of the old walls remained. The latter remark had naturally evoked considerable difference of opinion, and when, about fifty years ago, a zeal was shown for the preservation of the local antiquities, for the first time the claim was advanced that a large part of the north wall on the east side of the Northgate was Roman work *in situ*. Since that time it had figured as such in standard works, although considerable discussion had arisen upon the point, which was a most interesting one, and one that the last quarter of a century had given greater facilities for rightly judging than any previous period. During that interval large sections of the wall have been laid open for necessary repairs. Besides this, many excavations have been purposely made at the base of the wall at the more interesting points, to ascertain its peculiarities and character.

In dealing with the age of the walls, said Mr. Shrubsole, it is my intention to limit my remarks to one period involved in the question raised by Pennant. Does any part of the Roman wall still exist in the present walls of Chester? It were profitless and it is well-nigh impossible to judge by mere appearance of the age of a structure, on the whole so destitute of distinctive architectural features, which has had to be repaired or remodelled every century or two. Among much that is uncertain, one period we know stands prominently forward for distinctive recognition in the use of stone, tiles, and mortar in its constructive works, which enables us to distinguish it from all others. I allude to the period of the Roman occupation of Britain. The position that I take up on this question is opposed to the modern view, believing that, however pardonable may be the claim for the Roman age of any part of the city walls, it is one not borne out by anything to be seen there at the present time. It is an element not without value in this case that the oldest writers on the subject, such as Camden, Pennant, Ormerod, Tyson, and Henshall, make no such claim for the walls. The opinions held by those writers, and even older ones, might be summarised in the words of Ormerod:—"The walls of Chester follow the outline of the Roman work, and probably stand on the Roman foundation." On the general subject it may be said that historical evidence is against the probability of any portion of the Roman wall being extant. The facts bearing on the case are that, after the departure of the Romans, the Britons, Danes, and Saxons each in turn assailed the walls and helped on their demolition, leaving them for Ethelfreda to rebuild and, it is said, enlarge. Again we find in Norman times an imperative order was issued for the rebuilding of the walls, to be followed by a fine for non-appearance on the part of holders of land. For their history during the next five hundred years the Patent Roll gives us an insight into the state of dilapidation into which they had fallen from natural decay and intestinal strife. Subsequently, in the Civil War, the walls suffered severely, serious breaches having been made on the face of the wall. In this condition they remained until, as the inscription on "Pemberton's Parlour" tells us, "In the eighth year of the reign of Queen Anne divers wide breaches in the walls were rebuilt and other decays therein were repaired, 2,000 yards of the pavement were new flagged or paved, and the whole repaired, regulated, and adorned at the expense of 1,000*l.* and upwards." From this time a trifling tax on Irish linen imported into Chester provided a sufficiently ample fund to keep the walls in good repair. Under any circumstances it is impossible to believe that a perishable stone of the nature of our sandstone should have held together as a structure for 1,600 years. It is not even credible that 200 or 300 yards of it should have remained intact. It is far more probable and consonant with observation that there may have not been one, but four walls, in the space of time over which its existence has been spread.

Proceeding to examine the parts of the wall for which a Roman origin is set up, Mr. Shrubsole referred to the group of large stones found on the outside of the wall near Blackfriars, midway along the Roodee. One fact alone, he said, disposed of its claim to Roman origin. The base of the stones rested upon a quicksand which was the bed of the old river. To have neglected the solid ground above, and to have built the wall of the Castra on quicksand in a hole 50 feet below the level, was a mode of proceeding he could not imagine any military engineer capable of, least of all a Roman engineer. In examining the reputed Roman work at the Kaleyards, he accounted for the single course of stones there found by the fact that some centuries ago the city wall stood on the spot where these stones now stand. The foundation of clay proved treacherous, aided by the loose ground of the fosse in front and the outward thrust of the ground of the churchyard, and these causes proving too much for the stability of the wall, it was pushed outwards to such an extent as to be useless, and it was dismantled, the base being left in the place where it was found, and the new wall built inside the old one. The Roman work *par excellence* of some authorities was to be seen on the east side of the Northgate, between it and King Charles's Tower. Owing to certain clearances, the wall was now to be seen under exceptionally favourable circumstances, but, looking at the work as a whole from the base to the top, it must be confessed that for genuine Roman work it presented several anomalies, if not unique features. They were supposed to see here a wall which, from the plinth to the cornice, was believed to have been part of the Castra which encircled Deva on that side. The base had a very English-like look about it. The irregular size of the stones, large and small intermixed, had not the characteristic appearance of Roman work, and the whole was crowned by a cornice, an unparalleled example so far as the walls of Roman castri in England were concerned, and more nearly allied to the debased Classic cornices to be seen in the front of some of the gabled houses in Bridge Street of the Jacobin age than anything Roman. In 1884 a number of excavations were made in order to examine the inner face of the wall, when it was found that there was a singular absence of everything Roman about it, while all its affinities bespoke its connection with the work of the last two or three centuries. Other structures in the city, such as Julius Cæsar's Tower at the Castle and the Old Shipgate near the river, had been spoken of as Roman, but after very superficial examination—seeing that neither of the places alluded to were 500 years old—they were really out of the discussion, for most certainly neither of the spots were included within the Devan camps. As to the construction of the older portions of the walls, during the past twenty-five years he had on various times seen hundreds of yards of the present wall laid open for necessary repair, but in no instance had he seen the faintest approach to Roman work *in situ*. After referring at some length to the discussion as to the material of which the walls were constructed, Mr. Shrubsole said that all the evidence to hand went to show that the Romans in their several works made free use of local stone, as might be seen in Handbridge, where several hundred yards of rock had been excavated, and the microscopic examination of the stone showed that the stone in the Northgate wall was identical with the local stone. There was, therefore, no warrant for the supposition that the stone had been brought from a distance, and the wall, therefore, could not claim a longer life than was usual with a stone of its kind. The way in which the error as to the extreme age of the walls had arisen was readily explicable. If the opinion rested alone on a passing or superficial examination, such was the extent of the "weathering" of the stone and the seeming antiquity which one or two centuries would confer upon it, that it seemed natural to infer its antiquity was great. Looking at all the aspects of the walls he was of the same opinion as Pennant, and had come to the conclusion that nothing in the walls dated further back than the reign of James I. and Charles I.

The Rev. Dr. Bruce stated that his impression was that the Romans, in choosing the stones for their building purposes, were never satisfied with anything except of a very lasting and

durable nature. If they found a bad stone in the neighbourhood they would go miles away, and in the neighbourhood of Carlisle, where the same kind of sandstone existed as that found near Chester, it was observable that the Romans had gone a distance of eight miles in order to obtain a stone that would last some period. For his own part, he would say that he thought some portions of the Chester walls very like Roman work, but Mr. Shrubsole seemed to think those very portions were modern productions. Most of the ancient buildings in the north he found had been covered over with earth and plantations, and some of the foundations of Roman erections had been dug out quite recently in places where there was no expectation of their being.

Mr. Lister said one difficulty presented itself to his mind, and he would ask Mr. Shrubsole whether he had ever come upon any undoubted traces of the Roman walls on any work above ground or under ground in the city. If he replied in the negative the difficulty would present itself as to the destruction of the foundation of the wall. No siege or storm could have at any time destroyed the whole of the wall foundation inclusive.

Mr. Shrubsole said that at no period had they come across any traces that would lead them to believe that they had found the walls of the old Castra. Though they had found traces of Roman villas they had never found any traces of Roman walls.

CHURCH BUILDING AND RESTORATION.

Birch.—Five stained-glass windows have been placed in the chancel apse of the church of St. Agnes. They are gifts from Mr. C. S. Keeling. The work has been executed by Messrs. Heaton, Butler & Bayne, of London, under the direction of Mr. Medland Taylor, of Manchester, the architect of the church.

Dalston, Carlisle.—The late Colonel Salkeld having bequeathed to the vicar and churchwardens of Dalston the sum of 1,000*l.* towards the rebuilding of the parish church, it has been resolved to entrust the work to Mr. Paley, of Lancaster, whose eminence in his profession, and connection with the parish as grandson of Archdeacon Paley, alike recommend him as a person acceptable to the parishioners.

St. Ippolyt's Church, St. Albans.—The restoration of the chancel of this church has been commenced, and will probably be completed in about three months. Mr. Miskin, of St. Albans, is the builder, employed by the authorities of Trinity College, Cambridge, who are the patrons.

Wellington.—Plans have been prepared by Mr. Nicholson, of Hereford, and the tender of Mr. Culson, of Hereford, has been accepted for the restoration of this church, which is in a deplorable state. It is proposed to re-roof the church, carefully preserving the fine old oak timber work; to reseat it, to repair the tower—a rare specimen of Norman architecture; and to put it in decent order throughout. The chancel has recently been rebuilt by the Ecclesiastical Commissioners.

NEW BUILDINGS.

Richmond Library.—The public library facing the Green has been enlarged, the total length of the library being now 92 feet. The old portion of the library will in future be mainly used for the lending department. In the rear of the building a new furnace-room, lavatory, &c., have been erected. The old portion of the library has been considerably altered in order to bring it more in harmony with the architectural character of the building. The whole of the new fittings have been made in pitch-pine and varnished. The walls of the new portion have been built hollow. The ventilation of the library is effected by three of Boyle's exhaust ventilators fixed in the roof, and fresh-air inlet tubes discharging 5 feet 6 inches above the floor line of the building. The whole of the library roof has been reglazed with thick glass of a green tint, and the centre of the roof is double glazed. The new portion of the building is lighted by means of six of Wenham's pendant lamps, and a large May's pendant burner in the centre. Mr. Frank J. Brewer, architect, has prepared the plans, which have been carried out under his superintendence by Mr. F. Sims.

University Club, Glasgow.—A new University Union Club is about to be erected on a site granted by the Senate. The money for the purpose (5,000*l.*) has been granted by an anonymous donor. The building, for which plans have been prepared by Messrs. John Burnet, Son & Campbell, of Glasgow, consists of a two-storeyed erection with a low square tower, fronting University Avenue, flanked at the east end by the large hall, placed at right angles to the rest of the building with its gable to the street, and at the west end by a battlemented archway for carriages, with side doors for foot passengers instead of the present wooden gate. The part next the gate will be occupied by the lodge-keeper and club attendant. The principal door is at the base of the tower and leads into a large entrance-hall, one side of which is occupied by the staircase, with lavatories beneath. The hall leads to a broad corridor, with seats set in the windows opening on to the college grounds, to which another door gives direct access. On one side are three committee-rooms, while from either end one enters the dining-room, 34 feet by 20 feet, which can be used as a conversation-room. The assembly hall measures 58 feet 6 inches by 30 feet, and, with its galleries, will seat three to four hundred. It has been designed on the same lines as the House of Commons, with lobbies running round the back and sides, giving direct access to all parts of the hall, and to which members will pass when voting on those occasions when the hall will be used by the dialectic and other societies for their debates. At one end is the platform, with a door to the adjoining committee-room, which will serve as a platform retiring-room. Round the other three sides is disposed a gallery, to which access is obtained by two octagonal staircases entered from the before-mentioned corridors. The walls are covered below with wood panelling, and plastered above; the roof is of open timber-work. The second floor is occupied by a news-room of the same size as the dining-room, and by a library and reading-room 46 feet 3 inches by 21 feet. A smaller staircase gives access to an upper room in the tower 18 feet square, which is to serve as a smoking-room. It is proposed to make the subscription as low as 5*s.*, so that the club may be as representative as possible. The work in connection with the building has already been commenced. The building is to be completed before the opening of next summer session.

GENERAL.

Mr. William Lawrie, architect, of Inverness, has presented a painting—*Strolling Minstrels*, by Mr. R. Saunderson—to Stonehaven, of which town he is a native. This is Mr. Lawrie's third gift towards the adornment of the Council Chamber.

The Trustees of the British Museum have issued a descriptive and historical catalogue of Japanese and Chinese paintings in the national collection. The series was formed by Mr. William Anderson, for the purpose of illustrating an ancient and remarkable phase of art in its historical and technical developments.

The Belgian Annual Exhibition of the Fine Arts, which is held by turns at Brussels, Ghent, and Antwerp, was opened on Monday at Ghent.

Mr. G. G. Adams, F.S.A., has modelled a life-size medallion portrait in *alto-relievo* of the late distinguished Egyptologist, Dr. Birch, which is now placed over the grave in Highgate Cemetery.

The Stained-glass Window which is to serve as a memorial of the late Lord Curriehill has been fixed in St. Giles's Cathedral, Edinburgh. It was designed by Mr. Burne Jones, A.R.A., and executed by Messrs. Morris & Co.

The Museum of Casts in Brussels was opened this week. It occupies one of the pavilions of the Exhibition of 1880.

M. Cernuschi, banker, has presented to the city of Paris his unique collection of Chinese and Japanese bronzes, a considerable portion of which were derived from the Summer Palace of the Chinese Emperors, which was destroyed in the war of 1860. They then passed into the possession of Count Palikao, from whom M. Cernuschi purchased them. The gift will not, however, be available until after the death of the testator.

A Parochial Hall is about to be erected in Walsall on the site of the "Old Queen's Head," from the designs of Mr. James Davis.

Englefield House, near Reading, which was an interesting Elizabethan mansion, was nearly burnt down on the 12th inst. The Long Gallery erected for Queen Elizabeth, and the rooms used by King Charles and Queen Anne, are among the portions destroyed.

The Altar in St. Paul's Cathedral has been removed temporarily, in order to allow of the erection of the new reredos.

The Pro-Cathedral, Kensington, of which Messrs. Goldie were the architects, is now being painted in an elaborate manner.

The Rebuilding of the Queen's School at Kew having been necessary for many years, has at last been determined upon. Her Majesty has made a liberal donation towards the cost. The architect appointed is Mr. Edwin Dolby.

The Palace of Buda Pesth is to be further enlarged and embellished. The works will occupy ten years, and are estimated to cost 7,000,000 florins.

A Four-storeyed House in Carlsruhe collapsed on Tuesday, when several of the workmen were killed. The Public Prosecutor immediately ordered the arrest of the architect.

M. Gotteland, chief engineer of the French Public Works Mission at Athens, has submitted to the Greek Government the plans of a projected railway from Nauplia to Calamata, by way of Tripolitza. The line is to be 181 kilomètres long, and is estimated to cost 21,000,000 frs. The line from Kiatos to Xilocastion and Camaris, 21 kilomètres, and that from Milos to Argos, 10 kilomètres, will be open for traffic this autumn.

The Architect.

THE WEEK.

The First Commissioner of Works on Monday night informed the House of Commons that the works at Westminster Hall (which were recommended by the report of the Select Committee in April, and by the vote of the House in June of last year) are now about being carried out under the direction of Mr. Pearson. A contract has been entered into with Messrs. Shillitoe & Sons, of Bury St. Edmunds, the contractors for Truro Cathedral, and they are now making preparations and getting materials upon the site, so that the works will almost immediately be in active progress. The delay is described as arising partly in consequence of the vacancy in the office of consulting surveyor, and partly in consequence of certain technical difficulties which arose in connection with the settlement of the contract.

On to-morrow and Sunday the Roman Theatre at Orange will be again used for dramatic performances, and will assume a new aspect when seen by the aid of the electric light. The theatre was planned with much skill, and the hill on one side was utilised for ranges of seats. On the last time when the ruins were used the opera of "Norma" was attempted. More judgment is now shown, for the play will have a sort of local interest, as it relates to an incident that is supposed to have occurred in Arles when it was the French Rome. M. Silvan, of the Comédie Française, will have the principal rôle in the spectacular "Empereur d'Arles." Afterwards Molière's "Precieuses Ridicules" will be played. Orange has so ill a reputation with strangers that few care to see so interesting a performance when the price is submission to the mosquitoes and landlords; but the Vauclusians have thick skins, and are sure to enjoy the entertainment which the artists have provided.

Mr. R. O. Bottomley, the landscape painter, and one of the best-known members of the Manchester Academy of Fine Arts, was drowned on Saturday at Llandysilio. He was taking his holiday in the district, and on that day he walked along the River Vyrnwy, with the intention of fishing as well as making sketches. As he did not return at night, the river was searched, and his body was found in a place that was not more than three feet in depth. Mr. Bottomley is supposed to have fallen into the water while attacked by one of the fits of giddiness from which he suffered. He was a native of Oldham, and his earlier works were taken from the scenery in the neighbourhood of that town. During the last sixteen years Mr. Bottomley was an unfailing exhibitor in the exhibitions of the Manchester Academy. He was elected associate in 1870, and full member in 1878.

According to M. Veuillot, the best place in all Paris to compose a sonnet is on the Quai d'Orsay. The poet can there find solitude, and, if people meet him, they are sure to be politicians who are too absorbed with their own affairs to notice a wayfarer who is puzzled in trying to find rhymes. But when M. Veuillot composed his poems while walking up and down the Quai, it did not present the desolate appearance it has had since the Cour des Comptes was partly consumed. From that time the poets, like the rest of the world, appear to have forsaken the Quai d'Orsay. It will soon be in a less attractive condition, unless for misanthropes who love solitude. Now we are at least sure to find a sentry standing at the gate of the big, dreary barrack which Napoleon I. built for his imperial guard, and a few heads will be seen looking out of the windows. The soldiers all appear glad to see a passer-by. But the barrack has long been in an unsafe condition; like Imperialism it was not built to endure, and, as the residents were in constant danger, it is about to be demolished. What will be done with the site? Is it to be surrounded with a hoarding covered with gaudy advertisements in order to serve as a pendant to the neighbouring Cour des Comptes, with its blackened walls and gigantic weeds? It is known that M. Antonin Proust and his friends wish to convert the latter into a museum of decorative arts. Will they endeavour to get hold of the site of the barrack and form a museum on a grand scale, which might be done if the unimportant street dividing the buildings were closed? The ground in that way would be large enough, but the objection to its position would still hold. The Quai d'Orsay is too far from the manufactories and the chambers of artists, too far from Paris life to be visited by people. Designers and workmen would not care if it were assigned to verse-makers in perpetuity.

No less than seventeen Royal Academicians and ten Associates will be represented at the forthcoming exhibition in the Manchester Corporation Art Gallery. Over a thousand works have been accepted. The Sub-Committee have again had the benefit of the advice of Mr. P. R. Morris, A.R.A. Thursday next will be varnishing-day, and the exhibition is to be opened to the public on September 8.

The plans for the Manchester Jubilee Exhibition by Messrs. Maxwell & Tuke have been amended, and on Wednesday were approved by the Council. Tenders are to be sought immediately, and it is expected that within a month the works can be started. The principal alterations consist in the raising of the dome and pavilions, and the addition of a special annexe, containing 8,500 square yards, for the machinery in motion. The ground appropriated to the exhibition and gardens has an area of about thirty-two acres. Mr. A. A. Gillies has been appointed secretary, and Mr. S. L. Bapty general manager.

The visitor to the Louvre at the present time will find that he is allowed to see a good deal less than is marked out for him in his guide-book. The galleries are undergoing rearrangement, and the convenience of strangers could hardly enter in the calculations of the conservators. It is impossible, for example, to see the French pictures, for they are undergoing cleaning, a process which is rarely attempted, owing to the outcry which is always heard against the operators. The Italian pictures will not be visible for a week or two, when the big fresco, known as the *Magliania*, will be in a more suitable position. Some fragments were lately brought over which are said to have formed part of the palace of Darius. A Salle de Darius was at once got ready for their reception, and it has been decorated in an expensive way. It has yet to be opened. Indeed, the decoration of the Louvre has of late entailed a great expense, and M. Guillaume has a large body of artists and workmen under his direction.

Messrs. H. Saxon Snell & Son wish it to be known that they were not asked to report upon all the designs in the competition for the additions to the East London Hospital, Shadwell. Their examination was confined to the four designs selected by the managers, viz., those marked "Sunshine," "Thought," "Simplex," and one bearing a circle. Messrs. H. Saxon Snell & Son decided in favour of the design which bore the motto "Sunshine," and on this opinion the managers acted.

A competition has been opened among French artists for the decoration of the Salle des Fêtes and of the ceiling of the staircase in the Mairie of Pantin, one of the Paris districts. The sum to be paid is 36,000 frs. for five works. The choice of subjects is left to the competitors, who are to submit sketches one-tenth of the size of the pictures before November 15. The jury will be composed of the Préfet of the Seine, three nominees of the Conseil-Général, two delegates of the Administration, and three representatives elected by the competitors. Three sketches will in the first place be selected by the jury, and the authors will be asked to paint one of the figures shown in them to full size. The painter who in this second trial obtains most votes is to have the commission; 1,000 frs. will be paid to whoever takes second place, and 500 frs. to the third competitor. Each of the two prizemen will also be given a commission of the value of 8,000 frs. for other rooms in the Mairie. If it should happen that none of the three figures is worthy of adoption, the three competitors will receive 500 frs. each.

THE MEDIÆVAL BAPTISMAL FONTS OF ENGLAND.

[BY A CORRESPONDENT.]

(*Continued from page* 106.)

IN commenting upon individual examples of the baptismal font it will be best to proceed chronologically and commence with those of the Norman period, of which style, as has been previously remarked, England happily still possesses examples in great abundance. In so many instances, also, the sculpture and images to the font remain intact, whereas externally in canopied niches the mistaken zeal of the iconoclast has demolished them. But few of the various fonts touched upon here are illustrated in the special works devoted to the subject.

Commencing with fonts of the Norman period, we find at Albury Church, Oxfordshire, a remarkable specimen, more curious than beautiful, and resembling a flower-pot. It is of circular form, and has a rude suggestion of Classic triglyphs in the frieze-like band of ornament round the upper part of the bowl. There is no shaft, so to speak, for the place that generally occupies it is supplied by a kind of repetition of the bowl, encircled by a chevron ornament. Among Norman fonts, a large proportion cannot boast of much beauty in form, and the sculpture or carving is often rude and uncouth. But still many examples remain, the design and execution of which must command admiration. Thornby Church, Northamptonshire, possesses a font with a Norman bowl rudely octagonal in shape, the sides being bellied out and covered with interlacing ribbon-like ornament of a Runic character, the main feature on each of the sides being a large circle. This is almost as remarkable a Norman example as the last one commented upon. The shaft is of later date, and calls for no remark.

At Houghton-Regis Church, Bedfordshire, is a very curious Norman font. Part of the bowl is fluted, and the base is an inverted cushion capital. In twelfth-century work the latter feature thus perverted is not so unusual, as at Aylesbury Church, but in the Early English, Decorated, and Perpendicular periods is very rare. There is certainly a singular want of inventiveness displayed in thus treating a base, and in the later styles one finds much improvement in this respect, though the designs of the rest of the font became academic and monotonous while better in proportion. The barbaric and rude feeling of the earlier examples gave place to greater refinement, particularly, of course, in the sculpture and carving, but it was rather at the expense of vigour and originality.

The county of Cornwall is very rich in Norman fonts, as at Bodmin Church. They are more or less rude in design, as might be expected in so remote a part of England. The circular example at Lanreath possesses the honeysuckle ornament arranged around the upper part of the bowl like a frieze, while the base rather resembles an inverted bowl.

The font belonging to Camborne Church is curious, with four angels bearing shields and inscriptions set around the bowl, and recumbent lions guarding the base of the shaft, the symbolism of which representation is very appropriate to a font. The date seems to be thirteenth century, but it may be later, as in Cornwall the later fonts bear very much the character of the earlier.

One of the most remarkable designs in fonts in the knowledge of the writer is that at Crick Church, Northamptonshire. It appears to be of Transitional Norman, or early thirteenth-century character. The bowl is cylindrical, having on the top a rude suggestion of part of the dog-tooth ornament, the general face of the bowl being covered with large globes, projecting nearly half of their diameter, arranged in three rows, set very close together. It is difficult to imagine where the designer got his idea of this ornamentation. Possibly it was a mere caprice, or might have been suggested by some design in jewellery. There is no central pier or shaft, for the bowl is carried by three rudely carved representations of human beings squatting on pedestals. It appears as if there were originally four of these, as the platform or base is square in plan. This example is only mentioned as a curiosity, as it has no merit whatever, either in beauty of design, symbolism, or anything else.

Another Transitional Norman font worth alluding to is that in Chalgrove Church, Oxfordshire, which has a peculiar twisted shaft, but in other respects calls for no remark.

The writer will now proceed to consider a few examples of fonts of the Early English period. Most modern fonts possess three distinct and separate members, *i.e.*, the base, the shaft, and the capital, the latter forming the bowl. But the elegant thirteenth-century font to the church at Acton Burnell, Shropshire, does not at all contain these distinctive features in the usual way. In composition it is extremely simple, octagonal in form. There is a low, octagonal, square-edged plinth on which stand projecting delicately-moulded shafts, one to each angle, surmounted by capitals. Trefoil-headed arches, very handsomely moulded, are carried on the latter, and the top of the bowl comes almost immediately above the outer members of these arches. The whole effect of this beautiful font may be said to be obtained by the repetition, eight times, of the same well-considered feature on an octagonal plan. This is really the great secret of any of the most successful designs—judicious repetition of a carefully thought over composition.

The octagonal bowl of the Early English font at Lackford Church, Suffolk, is remarkably beautiful, mainly on account of the carving spread all over it. At the angles is only a bead moulding, as also to the capping and base of each side of the bowl. In the oblong panels thus formed occurs the charming conventionally-treated foliage above mentioned. Under the panels the bowl is chamfered off, and on the splay are two pateras and two dog tooth-like ornaments, alternating to each side. The shaft of the font is of the same plan as the bowl, and has a moulded base and capital.

The church at West Deeping, Lincolnshire, has a font, the plan of which is mainly octagonal, with almost detached shafts, surrounding a central pier, and carrying little arches. This makes a very effective treatment. Mr. PALEY, in his "Illustrations of Baptismal Fonts," speaks of a few Early English and Decorated examples, supported on arches with or without a central stem, as at Barnack, Northamptonshire, the specimen just mentioned, and at Forster Church, Cambridgeshire. He says the effect is admirable, the arches not being merely panelled ornaments, but pierced through, and he expresses surprise that this construction is of such rare occurrence. The writer fully endorses Mr. PALEY'S commendation of this beautiful type of font. How well he can remember, many years since, making a careful sketch of the exquisite font at Barnack Church, to which he can always turn with pleasure!

The leaden bowl of the Early English font to Warborough Church, Oxfordshire, is very remarkable. There is a small arcade in the lower part of the bowl containing four panels. This is divided from a similar arrangement of panels by a wider and higher panel containing rosettes. There are three of the high panels. Each of the small panels contains a figure, all of which are replicas, doubtless owing to the material employed, and represent a bishop raising his right hand in the act of benediction, and holding a crozier in his left. There is another example very like this one at Long Wittenham Church, Berkshire. The shaft of the Warborough font is a panelled Perpendicular one, with no striking features.

The font to Raunds Church, Northamptonshire, is thirteenth century, circular, and perfectly plain, with the exception of a ram's head projecting from one side of it, typical of sacrifice—a curious and unique instance, as far as the writer is aware. With not a few of the Mediæval fonts the design calls forth no admiration, but, on the contrary, rather provokes adverse criticism, as in the case of Great Addington Church, Northamptonshire. The bowl here (Early English) has sculptured heads resting on rude corbels, which seem to convey no symbolism or have any meaning. The shaft, however, is a good one—a central circular pier with four shafts attached to it, having well-moulded capitals.

At Rushden Church, in the same county, is a font with a bowl of about the same period as the last-mentioned, but with a very Late Decorated octagonal shaft panelled on alternate sides with pointed quatrefoils in two tiers, a species of panel founded on the saltire form, and other ornamental panels resembling the first-named. The bowl has plain semicircular-headed panels with simple foliage of a conventional character, springing

forth from the lower portions of these panels. It would be difficult to show a better example to the student of what constitutes "judicious reticence" in architectural design. The bowl has little ornamentation, but looks quite suitable to the requirements of a village church. But the panelled shaft does not seem to belong to it, and would have been a great deal more appropriate had it been left quite plain.

Among all the Early English fonts, it would seem impossible to find a more quaint or curious specimen than the well-known one to St. Giles's Church, Oxford. As regards the shaft there is nothing unusual. In plan it consists of a large cylindrical central pier, with four much smaller satellite shafts quite detached. All the shafts, including the central one, are surmounted by moulded capitals, the larger shaft having the capital of the same depth as the others, and not deeper, as so often occurs. The small shafts have a kind of chevron ornament in the abaci. The plan of the bowl is founded on the square, having shafts at the angle resting immediately on the capitals to the pedestal beneath. This is not a very usual feature in Mediæval work, but at Romsey Abbey Church we see it in the clerestory windows of the choir, as well as in other churches. But the designer of this font was not satisfied with merely having angle shafts, so he put two other shafts in each of the four sides of the bowl, the projection of which is rather more than half their diameter. Between each of these shafts the dog-tooth ornament occurs, so that the effect is crude and incomplete. A bold bowtel moulding, however, forms a kind of base to these intermediate shafts, its top being level with the upper part of the bases to the angle shafts. This bowtel appears rudely cut off to make room for the base of the angle shafts, and one wonders whether the design of this part, as also the top of the bowl, had been left unfinished. The appearance is necessarily very "liny," with its series of closely-packed pillars. In fact, it looks almost as if some mason had used his saw and abstracted one of the stones to some massively built cathedral pier. For this bundle of shafts, so to speak, appears as if it ought to bear a massive superstructure, whereas it really carries nothing whatever. The writer fears he has been somewhat tedious in describing this odd font at too great length, but it could not well be disposed of quickly. An interesting example of a font, the bowl of which, like that at Lackford Church aforesaid, is completely covered with carving, is to be found in the fine Perpendicular church of Banwell, Somerset. The main elements of the composition, like so many of the most effective fonts, are extremely simple, and it is by the manner in which the surface is embellished that richness is produced. The plan is circular throughout. Around the top of the bowl is a frieze-like band of small quatrefoils, the treatment of which is Perpendicular. But in other respects the bowl and shaft of the font appear to be of thirteenth-century character. Under the band of quatrefoils the surface of the bowl is completely covered with a conventionally treated foliage, the axis of which is vertical and arranged symmetrically. This carving resembles seaweed more than anything else, though the stonework has evidently been somewhat scraped. Such a leaf it is unusual to represent in carving, and justly so, as the forms are rather too rounded and wanting in vigour. The Mediæval men were clever in importing into their sculpture the most characteristic leafage, while at the same time they invested it with such a modicum of conventionality as would suit its adaptation to architectural purposes. One can fancy (the Bristol Channel not being more than five or six miles distant from Banwell) that the outline of seaweed would be familiar to the sculptor. This type of font, having the bowl encircled with foliage, is a very beautiful one, and the decoration peculiarly appropriate in such a situation.

The font at Thorpe Church, Lincolnshire, is one of the most elegant specimens of the thirteenth century, with its trefoil-headed arcade surrounding a cylindrical bowl. At Studham Church, Bedfordshire, the circular Early English font is very cup-like. The bowl is double-bellied, so to speak, and the base to the shaft resembles an inverted bowl. Such a treatment of the base is uncommon in the thirteenth century. In Norman work there is an example of it in the font to Stratton Church, Cornwall, and at Lanreath Church.

To speak of examples of the Decorated period, at Exton Church, Rutlandshire, is a specimen of a font where the diameter varies but little from top to bottom, in this respect resembling the Early English font at Acton Burnell previously commented upon, and not possessing the customary distinctive divisions of base, shaft, and bowl. Its form is an octagon, treated in a very elegant manner. There is a good illustration of it in Paley's "Fonts."

All Saints' Church, Norwich, possesses a fine octagonal font of Decorated character, and is more than usually embellished with sculptured figures. Each panel to the bowl contains two well executed effigies in high relief, representing the twelve apostles, as well as St. Paul, St. John the Baptist, St. Michael the Archangel, and St. George, and the shaft is also enriched with single figures in each of its panels. The panels in the bowl are mere sunk rectangles, without cusping or any enrichments save the sculpture. As an architectural composition this beautiful and well-known font ranks very high, with the two figures in the panels of the bowl and the single one below only standing on its individual pedestal. The arched canopied heads intertwined with foliage immediately above further conduce to the happy effect.

(*To be continued.*)

A SCULPTOR'S STORY.

THERE are very few people in Paris who do not traverse the Boulevards a great many times in every month, and as all passers by are sure to gaze at the windows of the shops where bronzes are sold, it may be concluded that there are very few people in that city who are unacquainted with the figure of *François Villon*, by M. François Etcheto, although they may not all have seen the original in the Square Monge. Villon or Corbeuil is a poet who has found devotees of late in England no less than in France, and his sincerity of utterance, however low may be the subjects, has an undoubted charm, especially if it is remembered that he was born four hundred and fifty years ago, when people were afraid to express their thoughts. But, apart from that, Villon is an important figure in French literature. The respectable Boileau, who was not disposed to be friendly to poets who were deficient in the moral sense, says that Villon was the first of the Frenchmen who practised poetry as an art:—

> Villon sut le premier, dans ces siècles grossiers,
> Débrouiller l'art confus de nos vieux romanciers.

The life of the poet was more sad than any that Johnson related, unless we make an exception in the case of Richard Savage. Villon was an university scholar, but somehow his acquaintance with Aristotle and Averroes brought him no office. Like Jack Falstaff, he came to believe that thieving was his legitimate vocation. But, unlike the English knight, Villon came under the "rusty curb of old father antic the law." He was put to the torture, and was twice condemned to the gallows. Strange to say, the cold-blooded Louis XI. always intervened in his favour, but no honest employment was provided for the poet. However, a priest was inspired with pity for Villon; he was carried off to the provinces, and there spent what was left of his life in peace and comfort.

Villon was thus a poet for whom the gutters of Paris served instead of the Pierian spring, and as a thorough representative of the Quartier Latin it was only fair that his image should appear before the eyes of students of a later age. The statue that adorns the Square Monge is as characteristic as any piece of portraiture in the city. Villon becomes suggestive partly of the feathered Mercury and partly of the *gamin de Paris*. As he stands he inclines a little to the left side, for a perpendicular pose, however well suited to a mathematician or a politician, would hardly correspond with the mode of thought of so peculiar a moralist. We know that "every true man's apparel fits your thief," and a tailor would be sure to say that Villon never was measured for the habiliments he is made to wear. But the short overall answers well for the concealment of thievery of an obtrusive kind, and, moreover, the loose folds may be a protection against an occasional pass of a rapier. The lute at the feet suggests the minstrel. The matted locks reveal he is one that comfortable citizens would consider to be of a disreputable class, who has often slept in the open air for want of a roof, but the keen eyes and the sensitive lips denote a spirit who could see beyond the shows of things. For Villon was able

moralise with the best over the riddle of life, and the talk of Hamlet in the graveyard is marvellously like what we might expect from a man who had just been reading some of the verses of the scapegrace. Our English experience suggests the difficulty of making a statue of a poet. Burns in Dundee, Tom Moore in Dublin, the crowd in Poet's Corner, all testify in that way. Abroad there are also figures of poets that offend the eye. Indeed, in all Europe we doubt if one can be discovered which is as expressive as M. Etcheto's *Villon*.

If, on seeing the statue, anyone might ask about the sculptor, the information would not be readily obtained. Strange to say, this marvellous work is one of the two which are all that are forthcoming to represent the powers of so able an artist. The second is a figure of *Democritus*, of which the marble copy was to be seen in this year's Salon. M. Etcheto is at present an invalid. The misery which sometimes awaits sculptors as well as poets was his lot, and it overcame a frame that was frail by nature. Thanks to the intervention of M. Paul Leroi (and it is not the first time his influence was exerted in behalf of unhappy artists), M. Etcheto was rescued before he was overwhelmed. He is now at Pau, and everyone who loves art must wish that a man whose genius is unquestionable may shortly be restored, and be able to endow his country with noble works. In the *Villon* we see only the 'prentice hand of the sculptor, and from such a beginning we expect much. In the last number of *L'Art*, M. Paul Leroi modestly relates the story, keeping himself as much as possible in the background :—

"When M. Etcheto exhibited his plaster models of the *François Villon* and the *Democritus* in the Salons of 1881 and 1883, I was," says M. Leroi, "very favourably impressed by them. M. Eugène Guillaume, and subsequently M. Ernest Barrias, the sculptor, expressed to me how deeply they sympathised with the sufferings endured by one who was a genius of the rarest class. Having admired the artist, I was eager to become acquainted with the man himself. I found M. Etcheto overcome with fever, and shivering near a handful of fire in a damp studio, that was close to the fortifications, and which became more dreary when one remembered that it was within a hundred yards of the elegant mansions of the painters in the Avenue de Villiers. He was without any commission, but in spite of his illness and misery he was modelling with a trembling hand a small figure of a woman, to which he imparted infinite distinction. I was heart-broken with what I saw. I promised to come again, and, when I did, I had the good fortune to be made the bearer of a commission for a reduction in marble of his *Villon*, which was offered by an eminent amateur (the Baron Alphonse de Rothschild), who, having become a member of the Institut, signalised his election by a generous and delicate encouragement of the sculptor's art. Sculpture is to-day the most marked glory of French art, but its votaries are badly recompensed—as, indeed, they have rarely been otherwise.

"M. François Etcheto was enabled to remove to a more habitable studio in the Rue Aumont-Thiéville. Unfortunately for him, the change was too late. His weakness had increased, and it was no longer possible to have any illusion that it was to be of a short duration. He continued, however, to work without any abatement of fervour ; this time it was on the reduction of the *Villon*. I counselled him to take some repose, assuring him that nothing could be more contrary to the desire of the patron whom I represented than his struggle to execute the commission in spite of his illness, and by which he was aggravating the danger. My efforts were all in vain. Having accepted the price of his statue in advance, M. Etcheto felt that he was bound to uphold the dignity of his art by completing the work. When it was ready, then he could be free. He held to his resolve in spite of all my entreaties ; but I could not help feeling respect for him, while I feared the consequences of his honourable conduct.

"I resolved to bring the case before a lady artist whose position in the great world is only employed in efforts to make people happy. Endowed with the highest intellectual gifts, her heart is as large as her intelligence, and this lady renders a service in a way that suggests the recipient instead of the donor of a benefit. I knew of some of the cases in which men of letters had been aided by her kindness, and how, also, artists had reason to bless their 'bonne camarade.' I had, therefore, no misgiving about the result of my appeal. I was hardly allowed time to state the circumstances before I was asked to return to the Rue Aumont-Thiéville and to order the invalid to depart forthwith to Pau, and there to entrust himself to the intelligent care of Dr. Meunier.

"The friends of M. Etcheto will be glad to learn that at Pau his health improves from day to day. Before leaving I asked him for a few autobiographical notes, and I have received the following in a letter dated November 16, 1885 :—

"'I was born of French parents in Madrid in 1853. I have gone through five years of military service. While stationed in Paris I was more or less able to attend the classes of the Ecole des Beaux-Arts. I belonged to the Atelier Jouffroy. It often happened that M. Jouffroy (whom I did not recognise as the professor) came beside me to give his advice to other students. I was entirely ignored. This conduct irritated me against him, and when I exhibited my *Villon* I did not describe myself as his pupil, but as "Etcheto, élève de l'Ecole Nationale des Beaux-Arts de Paris." That was my way of protesting. Although both M. Dubois and M. Falguière inspired me with admiration, I feared to be troublesome, and therefore have had little to do with them. I was in this way deprived of advice which might have made something of me. I know my deficiencies and must follow my unambitious career. When I compare myself with some of my friends who have vigorous constitutions, a supreme enthusiasm, and an undaunted courage, I often doubt if I am born to be a sculptor. They can produce works unceasingly, while I have made two statues. I have executed only a single bust that was commanded by the State. It is mediocre in character, for it was taken from an engraving, and I am not eager to undertake another work under such unsatisfactory conditions. In short, I am not an able man. I am deficient in knowledge, and am a slow workman. I forget myself in a contemplation of my model, and don't advance. In this way my works have cost me dearly. I am more disposed to study, or rather to produce no more than studies when treating a subject, and I make and destroy with the same outlay of nervous force, which becomes a very great fatigue. You ask how was my vocation revealed to me? I believe it was while trying to make my *Villon*, for before that time I was unable to finish a single study in the atelier, and one of my comrades, named Dampt, therefore used to call me "le lâcheur." I must say, however, that he has shown himself to be a sincere friend, and I heartily admire him. It was while alone in my atelier, in the Passage Dulac, standing before a work of which I could not foresee all the difficulties, and with scanty resources at my disposition, that I drank, once for all, the bitter cup, and if I was brought to comprehend how hard was the sculptor's life, I was also taught to love it as the greatest of the arts.

"'I fear I am unable to say anything interesting concerning myself. I have an afflicting remembrance of the deception that I felt in returning to the ateliers of the Ecole des Beaux-Arts. I was full of faith in my art. I expected to enter in a sanctuary, and, instead, I became a witness to all the stupidities of which ill-educated men can be capable. I have been harmed in this environment. I have lost my time and my best illusions. But what was to become of me if I remained in Paris and did not accept the offer of my benefactress? It gives me great pleasure to think sometimes that I may be able to do something to satisfy her intention. Do not forbid me, for I know the extent of my powers. Gratitude may double them, and then I shall have the happiness to produce something that may be called good sculpture.'

"This is no idle dream, for, if M. Etcheto recovers his health entirely, we may expect some additions to the two remarkable creations which have gained him so high a place among French artists. We have a right to expect much from a man who is described by one of the most clear-sighted of his friends as having the most superb artistic visions, which he timidly recounts, as if his enthusiasm were a failing which was sure to be ridiculed, and which are followed by a state of mental depression that is almost incredible. But the power that is exemplified in the *Villon* and *Democritus* leaves a hope that the sculptor will surmount all despondency, and reveal his strength in realising one of his dreams, which is the model of a woman palpitating with life. He will then be able to express the treasures of poetry which vibrate in him, and which for a time have to be suppressed."

THE BRITISH ASSOCIATION MEETING.

ON Wednesday next the meeting of the British Association for the Advancement of Science will commence in Birmingham. The following arrangements have been made for the excursions :—

The greater number will take place on Saturday, September 4, no fewer than seventeen having been arranged for that day. The other ten day excursions will be on Thursday, September 9, on which day, too, a "long" geological excursion, which may be made to last for six days, will be commenced. In one or two cases those taking part in the day excursions will be afforded facilities for extending their visits ; and, on the other hand, those taking part in the "long" excursion may arrange to leave or join the expedition at any stage of it. The excursions on Saturday, September 4, will include one to Oscott

and Sutton Coldfield, under the leadership of Alderman Stone (Mayor of Sutton Coldfield) and Mr. J. E. Bagnall, A.L.S. The Very Rev. Canon Souter will do the honours of St. Mary's College, Oscott; and after time has been afforded them for viewing the park and the church the visitors will be entertained at tea at Midland Lodge, Alderman Stone's residence in the park. An excursion to Halesowen, Clent, and Hagley will be conducted by Mr. Thomas Anderton. Halesowen Church, St. Kenelm's Church, Halesowen Abbey, and Hagley Hall and Park will be viewed. After tea, at which the visitors will be the guests of the Right Hon. Lord Lyttelton, the carriages will drive round the Clent Hills, through the village of Clent, to the Lyttelton Arms, Hagley. For botanical and geological members time will be given for a walk to the summit of the hill, and a descent through the park to the hall. In the course of the excursion the Leasowes, once the residence of the poet Shenstone, will be visited; while at Halesowen the half-timbered houses and other antiquities, and the home industry of nailing, will afford interesting subjects of observation. Excursion No. 3 partakes largely of a practical scientific character. The visitors will be conducted over the sewage farm at Saltley by Alderman Avery, Mr. William Harris, and Mr. W. S. Till, and the visit will serve to illustrate a paper to be read in Section G, by Mr. Till, on the work of the Birmingham Tame and Rea District Drainage Board. Alderman Avery, chairman of the Board, will entertain the visitors at luncheon at Tyburn Farm. Afterwards Castle Bromwich Hall will be visited (by permission of the Viscount Newport), the carriages going by Minworth and Water Orton. Mr. John Corbett, M.P., and Mr. Paxton Porter will escort a party to Stoke Saltworks, Westwood House, and Impney. Stoke Saltworks having been inspected under the guidance of Mr. Corbett, train will be taken to Droitwich. Thence visitors will drive to Westwood House, the ancient seat of the Packingtons, going afterwards to Impney, where Mr. Corbett will entertain them to tea. The excursion concludes with a walk to Droitwich Station. Coughton, Alcester, and Ragley will form the scenes of another excursion, the guides in this case being Mr. F. B. Goodman and Mr. Edwin Smith. Coughton Court (an ancient seat of the Throckmortons), Coughton Church, and the ancient Roman town of Alcester, will be inspected with the aid of local gentlemen; and at Ragley Park the Marquis of Hertford will receive the visitors at tea. The Tamworth excursion will be conducted by Mr. Egbert de Hamel and Mr. Wright Wilson. Here the visitors will be shown the castle, Offa's Dyke, the earthwork defences of the town, and the church; and at Bole Hall the visitors will take tea as the guests of Mr. de Hamel. Mr. J. A. Cossins and Professor Lapworth will take a party to Hartshill and Merevale, to view the geological sections exposed between Stockingford and Caldecote, Merevale Church, Merevale Abbey, Hartshill Castle, and Roman remains at Mancetter; Mrs. Dugdale has invited the party to tea at Merevale Hall. The excursion to Malvern will be led by Mr. G. E. Mackie, M.A., and Mr. J. W. Oliver. The visitors will leave the train at Malvern Link Station, and will drive through Malvern Wells, Little Malvern, and along the west side of the hills, returning through the Wych to examine the geology and botany of the district. Tea will be provided at Malvern College by Mr. Mackie. The railway tickets for this excursion will be available for return up to the Monday evening. An interesting geological excursion is arranged to the Wrekin, under the direction of Dr. Callaway, F.G.S., but the interest will not be purely geological, as the view from the Wrekin of the English counties and the principal mountains of Wales is one not lightly to be missed. Mr. Joseph Beattie will receive the party at Overley to tea. Mr. John Cotton will conduct a separate excursion to Buildwas Abbey and Wenlock Priory. The visitors will be the guests of Mr. C. M. Gaskell. Shiffnal, Tong, and Wrottesley will be explored, under the direction of Councillor Martineau and Mr. F. W. Martin. Opportunities will be afforded of viewing Shiffnal and Tong churches and Wrottesley Hall (where tea will be provided by the Right Hon. Lord Wrottesley), and those who wish it will be taken to view some of the more remarkable of the erratic blocks which abound in the neighbourhood. Shakespeare's county, of course, will form the scene of one of the excursions, and elaborate arrangements have been made to make the visit as interesting and instructive as a short visit can be made. The leaders of the party will be Mr. W. Percy Harrison, Mr. W. R. Hughes, and Mr. G. H. Kenrick. At Shakespeare's birthplace the visitors will be received, on behalf of the trustees, by Mr. Sam. Timmins, F.S.A. The Guild Chapel and King Edward's School will be shown by the Rev. R. S. de C. Laffan, the Shakespeare Memorial Buildings by Mr. F. Hawley (librarian), the gardens and site of New Place by Mr. B. Bulmer (custodian), and Holy Trinity Church (in the absence of the vicar) by the Rev. F. Smith. The Mayor of Stratford-on-Avon will receive the visitors at the Town Hall, and entertain them at tea. Time will be allowed for a visit to Ann Hathaway's cottage. The excursionists to Warwick, led by Mr. C. J. Woodward, will visit St. Mary's Church and Leycester Hospital, and are invited by the Earl of Warwick, after viewing the castle, to take tea in that historic edifice. The party which visits Stourbridge and Enville will be led by Mr. G. King Harrison and Mr. Charles Williams. The Lye Fireclay Works, Enville Church, and Enville Hall (with an invitation to tea by the Countess of Stamford), will form the staple attractions. Alderman Chamberlain, M.P., chairman of the Hamstead Colliery Company, has invited a party to inspect the colliery and descend the pit. The workings will be illuminated, so that photographs may be taken, and geological sections and fossils will be exhibited at the surface. Tea will be provided by the directors. An excursion to Lichfield has been arranged for under the guidance of the mayor (Councillor Lomax) and Mr. E. W. Badger. The cathedral, Dr. Johnson's statue and birthplace, and other deeply interesting objects will be inspected. The dean (the Very Rev. Dr. Bickersteth) will show the cathedral, and discourse on its history; and the mayor and inhabitants, with the dean and chapter, will entertain the visitors to tea at the George Hotel. Dudley and the Wren's Nest will be visited, with Mr. C. Tylden-Wright and Mr. W. Madeley as leaders. The limestone caverns in the castle grounds will be illuminated, and the museum of the Dudley Geological Society will be thrown open. The visitors are invited to tea in the castle grounds by the Countess of Dudley and the members of the Geological Society. This completes the tale of Saturday's excursions.

CASTLE ACRE ABBEY.

THE condition of this building, which is near Swaffham, is deserving of the attention of the Society for the Preservation of Ancient Monuments. According to Mr. Kingsford, the western façade is simply magnificent, and in some points unique; as a specimen of Norman architecture it is almost unsurpassed. In the early part of last month Mr. Kingsford visited the ruin, and was dismayed at the negligence of the parish or the owner, if it be not the property of the parish. In one of the chambers—the abbot's dining-hall—the centre of the old mantel-shelf has been ruthlessly cut out and carried away (this within the last twelve months); some of the mouldings in one of the beautiful side windows, where the dog-tooth is as sharp and well defined as if it had been carved but yesterday, have been torn down by mischievous boys out of sheer wantonness. The village has for years apparently regarded the abbey as a quarry, for stones from the fane are to be found everywhere. Surely pressure ought to be put upon the parish, or the owner as the case may be, to cause some steps to be taken to preserve this relic of the piety of a former age from further devastation.

TESSERÆ.

Westminster Abbey and Amiens Cathedral.

SIR G. G. SCOTT.

THE abbey church of Westminster was commenced in 1245 by King Henry III., and the eastern portions finished about 1269. This makes it contemporary, in a certain sense, with Amiens; for though the latter was commenced in 1220, it was not completed till 1288. There can be no doubt that the cathedral at Amiens was, at the time of its erection, viewed as the most perfect development of the style, for it is clear that it was made in many instances the model on which the designs of other churches were formed. Cologne Cathedral, for instance, was commenced in 1248, during the erection of that at Amiens, and is manifestly a free copy of it so far as concerns its earlier portions; and though Westminster Abbey is by no means built on the model of Amiens, it was probably influenced by it. That prodigious pile, carried forward through so long a series of years, would be a great object of interest to all contemporary church builders; and Henry, who was much in France, would naturally send the architect of his own sacred mausoleum to see the great work of his day. Westminster Abbey is a church built on a French ideal, but with English detail—a great French thought expressed in excellent English. The windows are of the perfected bar tracery, which had not ye been much used in England; but in other respects I cannot find a distinctively French detail—or scarcely any—in the building, excepting the work of a single French foliage carver. Even the plan, which is purely French in idea, is carried out in a manner quite different from that of any French church I have seen. In the architecture the union of the manners of the two nations is most happy. The pillars are nearly like those of the great French cathedral, but the side shafts, instead of being attached, are separate shafts of Purbeck marble, the nucleus and the capitals and bases being all of the same beautiful material. The use of this hard stone led to that of moulded unfoliated capitals, in which they lose in effect when compared

with those at Amiens; but the nobler material would more than compensate for this. The triforium is far superior to that at Amiens, both in design and detail, and the whole internal design, though inferior in size and altitude, is to my eye far more pleasing, and when its varied materials retained their colour, and the Purbeck marble, which pervades every part, preserved its polish, there cannot be a doubt as to the superior magnificence of its effect. The parts, too, are much better proportioned, with perhaps the one exception of the too acute form of the main arches; the wall arcading is much more beautiful, and the details generally more richly moulded. We have then here, at our doors, a building whose interior is equal to that of any existing Gothic building, and we have no excuse if we do not avail ourselves of so noble an opportunity of study. Of the exterior I will say nothing. All its old features had perished by the end of the seventeenth century, when they were vilely renewed, and this base restoration is now in its turn decayed.

The Chimney Shaft.

S. SMIRKE, R.A.

I must not forget to do justice to the chimney shaft. Out of these trivial and uncleanly smoke-vents architects have taxed their ingenuity to produce really marvellous objects of high æsthetic value. Of Classical interest they can scarcely be said to possess any, for it is very doubtful whether architects of Classic times recognised the existence of such a feature. Vitruvius does not even name them. The remains of Herculaneum present not a single example of one; nor do the mosaics, frescoes, or bas-reliefs of antiquity show any indication of one, as far as I know. There is every reason to believe that the only means of escape for the smoke of their fires was through a hole in the roof, like the louvres of Mediæval times, so that the "smoke nuisance" we complain of at the present day may lay claim to high antiquity. The very name of the large hall in a Roman's house, atrium, is believed to be derived from this nuisance. "Atrum enim erat ex fumo." The statues in these halls are described by Juvenal and others as "fumosi"; and Vitruvius advises that there shall be no carved work in the interior of winter rooms, as they so soon, he says, get covered with soot. I apprehend that the roof timbers of our old baronial halls must have presented much of the same appearance; and as Horace complains of the "watery eyes" produced by the smoky halls, so our own mailed knights and their retainers could hardly have been better off. You will find that antiquaries are by no means satisfied as to the period of introduction of this great domestic convenience, the chimney, but it was somewhat late in Mediæval times before chimneys became very common. Viollet-le-Duc gives us in his "Dictionnaire Raisonné" a good example of one of the thirteenth century, formerly existing in the Abbey of St. Lô, and in England we have examples of still earlier date; but as civilisation advanced, and men's domestic habits refined, the chimney became conspicuous. They lavished art upon the decoration of the hearths below, whilst the chimney above partook of the same feeling, and both gradually grew into favourite objects of design, until, in the sixteenth century, the exuberance of architecture—especially, I think, in France—led to the erection of those enormous and elaborate towers which we see provided for the discharge of smoke at Fontainebleau and very many other places.

Influence of Precedent in Architecture.

HERBERT SPENCER.

No two classes of men appear to have so great a respect for precedent as lawyers and architects; by the one it is looked upon as of more importance than equity, and by the other it is appealed to as being a greater authority than any abstract principles of beauty or fitness; a judgment biassed by the errors of our ancestors is considered as the best guide for conduct in modern times by the lawyer, and the architect uniformly persists in copying the designs of the ancients, however unsuitable they may be to the habits of the present day. The universality of this prejudice in the case of the architect is evidently attributable to the system adopted in his education. A youth is taken into an architect's office, and the first principle of any importance that he learns is that "it is impossible to excel the ancients, and that the only thing we moderns can do is to copy their works." He sees all around him engaged in making designs in accordance with the good old patterns, and is perhaps himself chiefly employed in preparing enlargements after some of the ancient examples; any natural taste that he may have for ornamental designing is checked by telling him that he will never be able to come up to the works of our predecessors, and that he would be employing his time much better in studying the precedents handed down to us. The consequence is that he gradually imbibes the same veneration for antiquity that influences his seniors, and at the termination of his pupilage, instead of having had his natural creative talent brought to some perfection, he is probably as little capable of originating anything worthy of admiration as he was at the time he was articled; and he commences his professional career with the same determination to adhere to precedent that characterised his instructors; and this resolution being the result of a prejudice implanted in youth, is rarely to be removed by any arguments that may be adduced. Surely it is sadly derogatory to the dignity of the profession to have to acknowledge that out of all the arts practised by the moderns architecture forms the only case (with the exception of sculpture) in which the ancients have not been far outshone. Such a conviction in the mind of an architect is certainly rather inconsonant with due respect either for himself or for his employment. Is it then to be wondered at that there should be that want of public respect towards the profession frequently complained of by architects? Is it likely that society should entertain any high veneration for an art whose very professors acknowledge themselves to be mere copyists?

Decay of Building Stones.

MESSRS. HOFFMANN, FRANKLAND & ABEL.

Building stones in general may be divided into two classes, 1. Those which consist of materials not easily acted upon by acids. 2. Those composed of materials which are partially or entirely acted upon by acids with facility. As an illustration of the first class, granite, porphyries and serpentines may be quoted; whilst to the second belong limestones, dolomites, and certain sandstones containing carbonate of lime as cementing material. Regarded from a purely chemical point of view, the difference in the resisting power to corrosive agents of different stones would appear at first sight to depend entirely upon their chemical composition; but even a moderate acquaintance with the properties of the components of such building stones demonstrates that there are other conditions at least equally instrumental in determining the degree of permanence of different stones. It is a well-established fact that the same chemical substance exhibits in different conditions a great variation of its behaviour with chemical agents. Numerous examples might be quoted in illustration of this. Thus, marble and chalk are chemically identical; but, owing to the difference in their physical structure, the one being crystalline and the other amorphous, the former is much less readily acted upon by acids than the latter. Again, artificial peroxide of iron is readily soluble in acids; peroxide of iron, in the form of hematite, is attacked with difficulty by acids; and the same oxide, after exposure to a powerful heat, is almost entirely insoluble in acids. The influence of aggregation in these instances, and in numerous others which might be quoted, is obvious and generally admitted by chemists, however different and imperfect may be their views regarding the connection between physical condition and chemical effect. The observations just made regarding the behaviour of substances such as enter into the composition of building stones, cannot but apply with equal force to the aggregates of such components to the building stones themselves. The atmospheric influences to which building stones are subject are many of them essentially chemical actions, involving processes analogous to or identical with those performed in the laboratory; although from the extreme dilution of the chemical agents, as existing in the atmosphere, they must necessarily be of a very gradual character. There are few instances in which the influence of the state of aggregation upon the permanence of a building stone is more apparent than in that of the dolomitic limestone used in the construction of the new Houses of Parliament. Here, in one and the same block of stone of comparatively small dimensions, we find certain portions of the surface powerfully disintegrated, while others appear in a perfectly sound condition. Chemical analysis has hitherto failed to establish any important difference in the composition of sound portions of such stones and those parts which are subject to decay; it is therefore legitimate to attribute the unequal permanence of the stone, under atmospheric influences, to such structural differences as may be comprehended under the term—state of aggregation.

Resonance in Rooms.

J. HENRY.

Every room has a keynote, and if an instrument be sounded on this, it will resound with great force. The continuance of a single sound, and the tendency to confusion in distinct articulation will depend on several conditions—first, on the size of the apartment; second, on the strength of the sound, or the intensity of the impulse; third, on the position of the reflecting surface; and, fourth, on the nature of the material of the reflecting surfaces. In regard to the first of these, the larger the room the longer time will be required for the impulse to reach the wall along the axis, and if we suppose at each collision a portion of the original force is absorbed, it will require double the time to totally extinguish it in a room of double the size, because the velocity of sound being the same, the number of collisions in a given time will be inversely as the distance through which the sound has to travel. Again, that it must depend upon the loudness of the sound, or the insecurity of the

impulse, must be evident when we consider that the cessation of the reflections is due to the absorption of the walls or irregular reflection, and that consequently the greater the amount of original disturbance the longer will be the time required for its complete extinction. Thirdly, the continuance of the resonance will depend upon the position of the reflecting surfaces. If these are not parallel to each other, but oblique, so as to reflect the sound, not to the opposite but to the adjacent wall, without passing through the longer axis of the room, it will evidently be sooner absorbed. Any obstacle also which may tend to break up the wave and interfere with the reflection through the axis of the room will serve to lessen the resonance of the apartment. Hence, though the panelling, the ceiling, and introducing a variety of oblique surfaces may not prevent an isolated echo, provided the distance be sufficiently great and the sound sufficiently loud, yet that they do have an important effect in stopping the resonance is evident from theory and experiment. In a room fifty feet square, in which the resonance of a single intense sound continued six seconds, where cases and other objects were placed round the wall, its continuance was reduced to two seconds. Fourthly, the duration of the resonance will depend on the nature of the material of the wall. A reflection always takes place at the surface of a new medium, and the amount of this will depend on the elastic force or power to resist compression, and the density of the new medium. For example, a wall of nitrogen, if such could be found, would transmit nearly the whole of a wave of sound in air, and reflect but a very small portion. A partition of tissue paper would produce nearly the same effect. A polished wall of steel, however, of sufficient thickness to prevent yielding would reflect, for practical purposes, all the impulses through the air which might fall upon it. The rebound of the wave is caused not by the oscillation of the wall, but the elasticity and mobility of the air. A single ray of sound striking against a yielding board would probably increase the loudness of the reverberation, but not its continuance.

Steining Wells.

B. Latham.

The sides of wells require lining or steining (as it is termed) with some material that can prevent the loose strata of the sides of the excavation falling into the well and choking it. The materials that have been successfully used in this work are brick, stone, timber, and iron. Each description of material is suitable under certain conditions, while in other positions it is objectionable. Brickwork, which is universally used in steining wells in this country, not unfrequently fails in certain positions; as by reason of admitting impure water under great pressure, or from the work becoming disjointed from settlement due to the drainage of a running sandbed and the collapse of the well. Stone of good quality, capable of withstanding compressive strains, is good in its way; but inasmuch as it requires an immense amount of labour to fit it for its place, it cannot successfully compete with brickwork in the formation of wells, more especially as it has no merits superior to those of brick when used in such work; however, if in any locality, by reason of its cheapness, it can be used, care should be taken to select only such samples as contain a large amount of silica; indeed, in all cases it is a point of great importance, in studying the nature of the materials used in the construction of wells, to select those which are likely to be the most durable, and at the same time preserve the purity of the water contained in the well, and this is best secured by silicious materials. Timber is objectionable as a material to be used in the formation of wells, on account of its liability to decay, and thus not only to endanger the construction of the well, but likewise to some extent foul the water by such decay. It is very largely used under some circumstances, especially in the preliminary operations in sinking most wells. It is also successfully used in lining the shafts of the salt wells of Cheshire, and will continue entire in such position for a great number of years, as the brine seems to have a tendency to preserve the timber and prevent its decay. Iron is of modern application, and is a material extensively employed in steining wells, and as it possesses many advantages over materials ordinarily used, its use is likely to be much extended. It possesses all the qualities of a good material, insomuch as by its character it is capable of bearing great compressive strains, and of effectually excluding the influx of all such waters as it may be desirable to keep out, and is not liable to decay under ordinary circumstances. The author has known instances where recourse has had to be made to the use of iron cylinders, where it has been found that four or five rings of brickwork, set in the best cement, have failed to keep out brackish waters; and if the original design had provided for the introduction of these cylinders, they would have reduced the cost of the well very materially. The introduction of iron as a steining for wells, whether in the form of cast or wrought-iron cylinders, under many circumstances, will always be attended with economy and success.

Wrought-iron Columns.

W. Fairbairn.

Since a flat plate will bend sooner than a curved plate, it would be concluded, naturally, that a round tube, of moderate dimensions and of given thickness and section, would be a stronger form than the same plate in a rectangular form, in which the resistance to crippling must depend solely on the four angles; and since the rigidity afforded by the angles is extended throughout the four sides of a rectangular tube, in some manner proportionate to the distance from the angles, it would be concluded that a square tube  would be stronger than a rectangular tube  constructed with the same plate, inasmuch as the central portions of the longer sides of the rectangle will be less maintained in form on account of their greater distance from the angles; similarly increased strength might be expected from this form  . These assumptions were all submitted to experiment, and confirmed. For this purpose a number of tubes or cells of wrought iron were constructed, all 10 feet long, and either 4 or 8 inches square or of rectangular form, about 4 by 8 inches; their ends were perfectly flat, and they were compressed, by the intervention of a lever, between two parallel discs of steel, with arrangements for maintaining the pressure perfectly vertical, the cells being supported laterally. The direct object was to ascertain the value of each particular form of cell, and to ascertain the resistance per square inch of section in each case. The lateral dimensions of these cells are so large that with a length of 10 feet the pillars were not destroyed by a flexure, as in a long pillar, but by absolute buckling or crushing. The strongest possible form should therefore give about 16 tons per square inch of section. Similar experiments were then made with circular shells, under precisely similar circumstances for comparison. The cylinders varying from 1¼ inch to 6 inches in diameter, the diameter being so small in some cases, as compared with the length, some of these pillars failed by flexure, and followed the laws of long pillars, the resistance increasing nearly inversely as the square of the length; but where the diameter was 6 inches, the length being 10 feet, flexure could not take place, and the cells failed by buckling or crushing, as in all the rectangular pillars, and in such pillars the strength is independent of the length. From the foregoing researches it will be observed, that in order to attain the maximum powers of resistance to compression in the use of iron plates in construction, that the square box with thin plates, next to the plate itself, is the weakest experimented upon; the next in the order of strength is the rectangular form with a division across the centre, as at *a*  ; but the best distribution of the material is in the cylindrical form.

Retaining Walls.

Sir John Rennie.

These, until near the latter end of the last century, had been usually built with horizontal foundations and courses, the interior side being almost vertical, and the exterior with a flat face and very little batter, or in many cases vertical. The curved face retaining wall was latterly introduced, with the foundation and courses inclining from the horizontal, so as to conform with the radius of curvature; this form of wall is preferable, in many cases, to the old, as combining greater strength with a less section, and being more convenient in other respects, and was commonly used by Rennie in his various works, when applicable. To whom the introduction of this improved form of wall is due it is difficult to ascertain with accuracy; but Rennie, Ralph Walker, and Jessop were amongst the first who brought it into use. A further improvement was made in the retaining walls used at Sheerness in 1815 by Rennie, where the foundation being composed of soft alluvial mud and quicksand to a great depth, more than usual precautions were necessary to render the walls substantial and secure. The object was effected by enlarging the base, and making the interior hollow, like a caisson, with the bottom in the form of an inverted dome; the outer or river face being concave, and the foundation, for a certain width, laid inclining at right angles to a tangent from the curved face of the front of the wall. The remainder of the foundation was horizontal, and the back or land side of the wall was vertical. Thus there was both a front and back wall connected together by cross walls, forming one mass; the inverted arches or domes under the hollow spaces being filled with chalk and gravel concrete, and the whole resting upon a well-connected platform of piles and cross-beams and planking. By thus distributing the same quantity of materials over a greater surface, the vertical weight per square foot was reduced, and the desired stability was obtained upon this very difficult and treacherous foundation. Rennie had previously tried with success a wall of a similar principle, and under similar circumstances, at Grimsby. General Bentham also tried a similar principle, about the same time, which was not so successful, in consequence of an unsuitable form and construction.

NOTES AND COMMENTS.

THE Liverpool Corporation, or rather the Fine Arts Committee belonging to that body, find some trouble in dealing with the claims of local artists. The hanging of the pictures sent by artists of Liverpool gave great dissatisfaction to them, and so loud was the outcry that the chairman was forced to resign. In order that there might be no allegation of favour to strangers, the Fine Arts Committee resolved to hang the local works together in two rooms set apart for the purpose. But this plan is not received with favour by the artists. They say that their works were lent on the understanding that the usual arrangement would be adopted, and treat the alteration as amounting almost to a breach of faith, inasmuch as local artists whose works are already sent in, and who, under the new arrangement, might prefer to send to other exhibitions, are deprived of the opportunity of doing so. The interpretation which the public will give to the arrangement is, according to the Liverpool Academicians, that the pictures were considered unworthy of being placed alongside the contributions of artists from other places, and accordingly they decline to appoint two members of the Academy to select and hang the local works. It is almost as difficult to have a satisfactory arrangement of pictures as a satisfactory competition. What is proposed by the Corporation should be considered as an experiment. There is no more ground for concluding that the local pictures will suffer by being placed together than for the reverse conclusion. The wisest course would be to accept the Committee's arrangements; if they are found to be unsuccessful, the Liverpool Academy can advocate a different arrangement, and it would be sure to have the support of the public.

THERE is an apprehension that the ateliers of the French Ecole des Beaux-Arts are likely to be suppressed. The Government are introducing economical reforms on all sides, and it is supposed they will decline to grant the 2,800*l.* a year which is the principal support of the ateliers. Supporters are to be found for the reform among artists. The school has become too conservative to please many minds. New styles of art are invented every year, but they find little favour from the Professors, who continue to believe in the supremacy of the Greeks and the great Italians. Sensational novelty counts for nothing in the awarding of prizes. It is also supposed that the ateliers, being almost gratuitous, interfere with the rights of artists, for students naturally avail themselves of the most economical teaching. With a large section of the public the school has ceased to be influential. There are critics who make it a rule to ridicule the pictures which are sent to the Salon by Prix de Rome men, and in this way the prejudice against the school is revived. It is believed to be as much addicted to antiquated notions as it was in the days when it was tied to the Académie des Beaux-Arts. The school may need reform like most institutions of our time, but it will be an unwise piece of policy to sacrifice, by a stroke of the pen, the ateliers which are the source of its life. What revolutionists desire is simply a place of examination corresponding with the London University.

MR. CARY-ELWES, who was declared by Mr. Justice CHITTY to be the legal owner of the ancient boat found at Brigg, does not find it easy to obtain a custodian for the treasure. The boat was offered to the British Museum and to the museum at York, but the authorities of both institutions have declined its acceptance. Enough space cannot be afforded for its exhibition. Whether it was offered to one of the South Kensington Museums has not been stated, but the possession of the boat would be sure to be made an excuse for the erection of a new gallery.

MR. HOLMAN HUNT, in his last letter on the reform of the Royal Academy, offers the following suggestion:—As in all social disorders, he says, the first question to put is how the franchise is vested. It is agreed on all hands now, except by those interested, that the system of election from within is a vicious one; in this case I think it is the cause of the evils which are generally regarded as unbearable. Election from without seems to be a necessary change; if so, there is only the question of duration of office. I propose this should be for a stated period—say seven years—and then retirement from duties or re-election. This could scarcely be objectionable; if so, it will not be difficult for all to come to accord on vital questions. If the French system of selecting a hanging committee is found to work badly, it will not be difficult to modify it. My aim in proposing it was to save the members this trying and thankless labour—in part or in whole—when they will have so many to fulfil on which the future of art will more depend.

THERE are independent artists and ultra-independent artists in Paris, and they hate each other as sincerely as they hate the Committee of Selection of the Salon. The two bodies have been allowed to hold exhibitions in the temporary buildings which still occupy a part of the site of the Tuileries, and both were opened on the same day. This is the first year of the rivalry which will not serve interests that ought to be in common. The independent exhibitions were patronised because the French public have not such a blind faith in the rulers of the Salon as in England is felt towards the Royal Academicians. They know by sad experience in France that if any set of men are entrusted with power, and without any checks, they are sure to abuse it. So every year people run in quest of the few works worth notice which are to be found amidst a good deal of rubbish. It is some sacrifice to go through one of those exhibitions, but the toughest art critic would recoil if he were compelled to face a pair of them.

THE people of Kidderminster have found a difficulty in determining the best form of a memorial of the late Earl DUDLEY. His lordship was not endowed with the form that sculptors admire, and a statue would, therefore, have to be of the ideal kind. Besides, a good deal more money would be necessary than is likely to be collected among the Earl's admirers. A financial obstacle was likewise in the way of founding a science scholarship, which is one of the latest modes of memorial raisings. An oil painting was also over-expensive, unless it was of the coloured photograph class. In the end, an architectural work, from its cheapness, was deemed to be the most eligible. A DUDLEY cloister is to be added to the parish church. The subscriptions promised amount, it seems, to 120*l.*; but there are fears that all will not be paid in cash. We suppose it is intended to proportion the number of arches to the amount received, and hence the suitability of a cloister, which is considered to be rather elastic in admitting of extension or contraction.

THE last report of the Committee of Privy Council on Education states that up to April 1, 1886, the committee had sanctioned 6,459 loans, amounting to 18,452,556*l.* 15*s.* 1*d.* to 1,765 School Boards, by means of which new accommodation will be furnished for some 1,489,729 scholars. The estimated cost per child is thus about 12*l.* 7*s.* 8*d.*, but the amount of the loan applied for is generally in excess of the sum eventually spent. In the twelve years ending December 31, 1882, building grants to the amount of 312,200*l.*, have been paid by the Education Department on the completion of the erection or enlargement of 1,572 voluntary schools and 933 teachers' residences, affording new or improved accommodation for 280,146 scholars. These grants have been met by local contributions to the amount of 1,348,169*l.* The average cost of erecting voluntary schools, with residences for the teachers, has been about 5*l.* 7*s.* per scholar. This includes, as a rule, the value of the sites, very often given gratuitously in the case of schools of this class. The great majority of the remaining 4,747 voluntary schools, with seats for some 1,239,000 children, which have come under inspection since 1870, have been erected, enlarged, or improved, without Government aid, at a cost to the promoters of at least 6,000,000*l.* It is generally calculated that school seats should be provided for one-sixth of the total population. For the estimated population of 1885 (27,499,041) the returns therefore ought to show a provision of 4,583,173 school places. The actual supply (4,998,718) is somewhat in excess of this; but it is not evenly distributed throughout the country. In most counties the seats are now in excess of one-sixth of the present population.

ILLUSTRATIONS.

NOTRE DAME, PARIS, AND THE PONT DE L'ARCHEVÊCHÉ.

IT would be strange if a publication like *L'Art* omitted the utilisation of the opportunities offered by the streets and buildings of Paris as subjects for illustrations. M. Lucien Gautier has produced a great many of the views from the city, one of which we give to-day. It shows the east end of Notre Dame, with the Pont de l'Archevêché. On the right is the Morgue. The Pont de l'Archevêché was constructed in 1827, and is a type of the flat segmental arching generally adopted by French engineers. The span of centre arch is 55 feet 8 inches, and each of the side arches is 49 feet 2 inches. The bridge was subject to a toll up to the time of the Revolution of 1848. The public garden enclosed by trees behind Notre Dame was the site of the archbishop's palace—hence the name of the bridge and quay. The building was destroyed in 1831.

ARCHITECTURAL ILLUSTRATION SOCIETY.

NO. 19. A CASKET.
NO. 20. A TRINKET TRAY.

THESE form part of a toilet set, designed by Mr. W. G. B. Lewis, architect. The casket is divided into three panels longitudinally, the centre panel representing a betrothal, in allusion to its being a marriage gift. The figures are in relief and enamelled. The side panels are filled with ornament, having jewelled foliage, surrounding antique cameos. The cornice is enamelled with translucent ruby enamel, the curved top is covered with scales in different coloured enamels, heraldic achievements in relief occupy the ends. The trinket tray is formed out of a nodule of agate, its carved ivory stand, representing trunks of trees, is overlaid with woody nightshade, having enamelled leaves, flowers and berries. The dragon which has climbed the back of the tray and guards the treasures is covered with green enamel.

The drawing from which these illustrations are taken was exhibited this year at the Royal Academy. It is, however, not possible in a monochrome to give any idea of the colour, upon which the general effect depends.

DESIGNS FOR THE ASSIZE COURTS, BIRMINGHAM.

WE publish this week two of the designs which were submitted in the recent competition. One is by Mr. E. W. Farebrother, F.R.I.B.A., Victoria Chambers, Great Grimsby, and the second is by Messrs. G. B. Nichols & Son, of 49 Queen Victoria Street, E.C., and Birmingham.

RESTORATION OF CHURCHES IN VENICE.

THE relative importance of the great restorations of St. Mark's and the Doge's Palace has, says a correspondent of the *Times*, so occupied the minds of the few who are really interested in the preservation of Venetian architecture, that some important pieces of work, already complete or nearly so, are unnoticed. Among these is the lovely Renaissance church of the Miracoli, which has been completely renovated and, *me judice*, in excellent taste, the coloured decorations being freshened, the beautiful pavement repaired and renewed, and the old altars restored to their original positions, while the sculptured marble ornamentation, being under shelter, has had no need even of cleaning, and the church has probably very nearly the appearance which it had when new.

The policy of renovation of the old architecture where the state of decay has rendered reparation necessary, is one which is very much a matter of taste. In the church of St. Mark's all the new marbles introduced to replace those which were no longer retainable *in situ* have been left in the state of freshness which newly-worked marbles must have, and this excites the ire of the enemies of restoration, who are vexed by the rawness of the stone. The Ducal Palace is restored on the other plan of giving all the new stones the appearance of old, to keep the unity of the building, and this exasperates the anti-restorationists as an attempt to pass off for the noble old work the ignoble doings of the degenerate successors of the Doges. There is still further choice of treatment besides these two. One method is to leave the buildings to the natural effect of decay and disintegration until they become piles of ruin, from which capitals and fragments of friezes and masses of the old mosaics may be rescued and sold to American, English, or German tourists or dealers in antiquities, and of the original buildings only picturesque subjects for painters shall remain. Advocates of this treatment there are, but they probably never thought that if the successors of the builders had had the same ideas there would by this time have been no St. Mark's or Ducal Palace for them to see; but perhaps buildings of the seventeenth century erected on their sites, cleared of their ruins, or, at best, that the Ducal Palace should have been reconstructed in the end of the sixteenth century, when Da Ponte saved it from demolition by temporary disfigurement. The other, and, so far as I can see, only remaining alternative, is to replace broken and unserviceable stones by others in the rough, so that the untrained eye need not mistake the new for the old.

In seeking to compel the guardians of the architectural treasures of Venice to adopt one or the other of these systems the malcontents must remember that the entire tradition of Venice is one of repairs, and that every generation has left something of its sign manual in the great buildings of the State. If the renovator is a desecrator, then there is little but desecration now left. St. Mark's stands over an older church, and the Ducal Palace replaces two, while the entire arcade of the south and west sides was added to a building a century older. Many of the finest old churches must have been swept away to be replaced by monstrosities like St. Moisé, or the Jesuit churches, which are everywhere a stigma on Christian architecture. The present spirit of restoration respects the style of every past century, and even St. Moisé is restored in its own character as a page in the history of art. The nineteenth-century Venetian architect does what his fifteenth-century predecessor did—puts his best talent in the service of the old architecture, and he has at least this advantage, that he does not pretend to supplant the old by his own original conception, but does his best to follow and preserve all the traces of the original workers, restoring Gothic as Gothic, Romanesque as Romanesque, and Renaissance as Renaissance. All that any age can do is to give the best, and this is giving its best to the preservation for posterity of what time and decay have permitted to reach us.

Where the autographic quality of the work is not important, as it is in the campanile of Giotto, and much of the sculpture of the Duomo of Florence and the Ducal Palace and St. Mark's, the question of renovation is purely one of taste, and an architect who is capable of restoring a church to its original richness by renovation of the old decorations, keeping the original character, is certainly entitled to general approbation. In this spirit the Miracoli church is restored, and most visitors to Venice will see it in the coming winter with pleasure, as one of the loveliest of the Renaissance churches of the city. The Madonna del Orto is also completely renovated within, and the gilding and colour of the capitals and ceiling restored, and I think that none but those who love art, as they do wine, the better for its age, will find this restoration *de trop*.

St. Giovanni and Paolo, with its tombs of the Doges and its huge frame of wooden ties and braces binding its brickwork together, is in process of a much-needed structural reparation, the dome menacing ruin. Behind it the chapel, where the *Peter Martyr* of Titian and other art treasures were burnt through the carelessness of the church attendants, remains as the fire left it—a warning scarcely well heeded when we see in the Frari the noble Titian still being smoked by the candles of the altar, and the most exquisite piece of Renaissance ornament in Venice, that of the tomb of Doge Moro at St. Giobbe, still trodden under foot by all who enter the sacristy. But one can hardly make the priesthood the mark of special censure for this kind of negligence when we find families living in the Ducal Palace and exposing its existence to the danger of a fire among the network of five-century-old oak timbers which makes its inner structure, and even in one of the halls under the Great Council chamber a perpetual exhibition of Venetian manufactures—a bazaar, where samples of distilled liquors and other combustibles repose tranquilly by a show-case filled with wax and other matches, &c.

Murano Church is completely restored, and, it strikes me, very well done; but as the work outside is almost entirely brick of a very good quality, washing and pointing have given it very much the air of a new church, though almost no renovation has been done.

At Torcello almost nothing is done, or was to be done, on the outside, the brickwork here too resisting, as the stone exteriors have not; but the inside is a lesson on the way in which the Church preserves its antiquities, *i.e.* not only here but through all Italy, by substituting the most vulgar and theatrical altars and altar decorations for the fifteenth century and Renaissance originals. Torcello is unique among the churches of Venice, and, so far as I know of Italy, in the arrangement of the apse, which seems to have been originally calculated for the Orthodox form of worship, as, in fact, probably all the early Venetian churches were. At Torcello the throne of the bishops was on a high platform, to which a flight of steps led, and

around in a semicircle the seats of the clergy were placed in tiers rising one above the other. In front of this must have stood a low communion table with a screen between the seats and staircase and the church at the sides. This is now replaced by an offensive seventeenth or eighteenth-century theatrical altar, with cupids and posturing angels hiding the throne of the bishop and the seats of the clergy, which, being out of sight, have been pillaged of all the casing of Greek marble which covered the brick substructure, which now appears in a state of utter dilapidation. The great mosaic which covers the wall above the doorway is admirably restored, and that of the apse is still under restoration, while the steps to the throne and the theatre around it are in process of renovation to their primitive condition in A.D. 1008, by the care of the Government of Rome. But while the high altar remains, or the only less offensive, because less prominent, side altars, no restoration will give an adequate idea of the original church.

The adjoining church of Santa Fosca—earlier, I believe, than the cathedral, and subsequently its baptistery—suffers still more by the bad taste of the clergy in altering and ecclesiastical furnishing, and here has been restoration which was destructive. The original character of Santa Fosca has long been lost beyond retrieval or complaint of the Society for the Protection of Ancient Monuments—who, by the way, have just forwarded another protest against the restoration of St. Mark's, and especially, I understand, against the levelling of the floor. As, at the present moment, no one thinks of undertaking that very considerable work, or has proposed it, as it involves taking up the entire inner area of the church and removing the bases of the piers of the old church, the protest is so far premature. When the time comes this work will certainly be done, and all the protests of the Society for the Protection of Ancient Monuments—which, be it observed, bears no share of the responsibility for the church or the charges for its care and preservation—will have as much and no more effect than when they were raised against the restoration of the façade. The commission for the works on the church has as much regard for it as any English society can have, and both Government and public, so far as it knows and cares for such matters, resents as intrusive and out of place the interference of foreigners, who, the Venetians say, cannot agree on the preservation of their own monuments, and are utterly unqualified to undertake the direction of the Venetians. If the society will send a competent architect here to assist the commission, I am certain he will be politely received and listened to; but long and wordy protests, in English too, like that just received, made by people who know nothing of the matter, and have no concern with it, would not, *mutatis mutandis*, be received with politeness by Englishmen from Italians, and are simply postage and labour thrown away.

Before leaving this subject, however, I must say that the Municipality of Venice deserves very little of the commendation I have given the Italian Ministry of Instruction. It is continually allowing monuments of historical importance and the highest local interest to be taken from house fronts and courts, and sold abroad. Just now the relief over the door of the old Convent of St. Domenico, founded by Doge Marin Zorzi, and the last remaining street monument of old Venice in this quarter, has been sold by the proprietor of the house, and will probably follow many others abroad. If it were on a church or in a convent the Ministry would save it, but as it belongs to the city of Venice it has no protection. The aggregate incompetence, indifference to the general good or the public decorum of the municipalities of Italy, with two or three notable exceptions, is doing more to check the prosperity of Italy than the mistakes of the Ministry or the irregularities of the national officials. Municipal government is not understood even in the great cities, while in the small communes the councils are simple machines for private emolument. But in Venice, after eleven centuries of doges, we have a right to expect that the municipality will know how to protect the city from the speculators.

EXCAVATIONS AT JERUSALEM.

AN account is given in some Vienna and German papers of excavations made by the French Dominican monks at Jerusalem on some land which they have lately acquired, about a furlong and a half outside the Gate of Damascus. Six mètres below the present level of the ground the workmen came on some arches of considerable extent, the walls of which had been very carefully built. At a short distance they found the basement of a chapel, before the entrance of which there was a tombstone covered with a long inscription. Unfortunately, this stone was stolen before any one thought of copying the inscription, and no trace of it could be obtained. About the middle of their property they found a large well-preserved mosaic, and upon the space all around being cleared the bases and other remains of great pillars were discovered. It is presumed that this is the site of the great basilica built in the fifth century in honour of St. Stephen by Eudoxia, the wife of Arcadius, the first of the long line of Eastern emperors. Still more remarkable is the discovery made just on the boundary of the estate. While digging the trench for the foundations of the boundary wall which the Dominicans wished to build, the ground gave way, and one of the workmen disappeared. On clearing out the place they came on a large and beautiful hall which had been cut out of the rock; where the rock failed the gap was filled by admirable masonry. From two of the sides two large doorways led into two vaulted tombs, all of equal size. On each side of the vault there was a resting-place for one coffin, and at the end opposite the entrance places for two. At the furthest end of the great hall a passage led to another excavated vault, in which stood three great covered sarcophagi. It is suggested that these sarcophagi contain the remains of Helena, Queen of Abiadenos, and her sons. The quantity of bones found in these chambers was very great. In the middle of the great hall, in a hollow specially prepared, a sort of long metal box was found. It was adorned with representations of children holding garlands up on high. Unfortunately there was no inscription, nor anything which could furnish a clue to the period or the purpose of these sepulchral chambers.

THE CHESTER HYPOCAUST.*

BY way of preface to a description of the hypocaust discovered in June last, the author regrets that owing to the difficulty of obtaining correct dimensions, the filthy state of the soil, and other causes, he is prevented from giving to the Institute a paper fuller than the title implies. The author feels honoured, however, by the request to lay such information that was by any means obtainable before this meeting. In June last the work of laying a connecting sewer from the intercepting sewer on the Roodee to drain Black Friars and its district commenced. Having formerly discovered the interment supposed to be Roman near this line on the outside of the Walls some years ago, the author felt sure that the further opening of the neighbourhood would yield other proofs of the Roman occupation of this city. Proceeding onwards from the Roodee, the excavations passed through the clay under the City Walls foundation opposite the house occupied by Mrs. Blackburne, near the centre of the roadway, at a depth of 13 feet below the present surface, the remains of a hypocaust, more or less in a good state of preservation, was discovered. The drawings, now exhibited for the first time, show in some measure the form and arrangement so far as could be seen. The western and eastern walls measured 2 feet 9 inches at the top with a slight batter, the eastern wall having a slight batter and set-offs, and having under strata of clay. The concrete floor, several pillars, and a specimen of the masonry were cut out, and are now deposited at the Grosvenor Museum by the Town Council. To a practical man's eye this masonry approximates in many respects to several portions of our City Walls. No trace of bonding tiles was found, though the masonry was enclosing so large a number of tile pillars. The form seemed to partake of that of a chamber with a semicircular end facing west. The internal dimensions of this chamber on the longest line exposed to view, and from west to east, measured 9 feet 8 inches. The width could not be ascertained, the trench being only 2½ feet wide, and the probing under being attended with danger, owing to the superincumbent mass of filling-up stuff and the wet mud at the bottom. Keeping to this longest line, on which there were the remains of twelve pillars, a series of four supported for a distance 5 feet 3 inches a concrete floor, in splendid condition, 6 inches thick, varying to 7 inches. These pillars also rested on concrete, the under portion being of loose material, then came the clay under all. These supporting pillars were found in a perfect state, the remaining ones, as said before, being more or less destroyed, but ample portions of them were left to identify their original position. The upper floor concrete had at the distance named a square-worked edge, and seemed to have been stopped originally at this point. Large tiles abutted against the same, but little trace of these was found. The tiles forming a pillar were ten in number, the base or foot tile being 10½ inches wide, 16 inches long, 2 inches thick; then came seven shaft tiles 8 inches square, then under cap tile 12 inches square, 1½ inches thick; upper cap tile 17 inches square, 2 inches thick, and the concrete floor supporting tile from pillar to pillar, 2 feet square. All these were bedded on each other with mortar. It may be important to mention that the pillars found adjoining the walls were composed of stone slabs, cut as nearly as possible to the form, dimensions, and thickness and number of the tiles in the pillars. What on earth this extra labour was given to cannot be imagined. Broken flue tiles were also found in the filling-up stuff here,

* A paper read at the meeting of the Royal Archæological Institute, by Mr. I. M. Jones, city surveyor.

and a flue tile was removed by the author, which stood vertically near the last wall pillar—whether in its original position could not be verified. Bones, tiles, and coins were found during the course of the excavation, and a tile with an inscription, which may hereafter prove most interesting, was handed to the curator of the Grosvenor Museum. A curious point may also be named, that the level of the bottom floor of the hypocaust is 40 feet above ordnance datum. Corresponding with the present level of the street at the Watergate, not many yards distant, the present Roodee is 21 feet below this floor, and the present parapet wall some 14 to 16 feet above the floor. The City Wall is distant 21 yards from the semicircular end, and it is to be regretted that this discovery was not made at an earlier date and before the opinions had been formed as to possible extension of the Town Wall at a later time, as the centre of the hypocaust is shown to be distant about 12 or 15 yards only from this mythical or imaginary wall. The remains were examined *in situ* by the Lord Bishop of Chester, the Very Rev. the Dean, Alderman Charles Brown, and many local archæologists and visitors. Leaving the hypocaust, further along the trench a series of excavations had been made, leaving cone-like mounds of clay with mud between. This may be a subject of further discussion. The author has only touched on the fringe of the subject, hoping by discussion of the facts the truth may be elicited. The Very Rev. the Dean supports his suggestion that further excavation be made with permanent entrance at this point, as the necessarily imperfect exploration and covering up again leaves certain matters open to doubt. Thanks are due to Mr. Meacock, draughtsman, and the Corporation employés for their strict attention to his directions, the author believing that a due acknowledgment to practical men, whether professional or artizan, for any help given will lead to stubborn facts being more extensively obtained and circulated, and so get rid of imaginary ideas and surmises. This duty of giving credit where credit is due has not always been performed locally, and the author cannot forbear taking this opportunity of mentioning it. In conclusion, the Town Council, in this as in all other matters connected with the archæology of the town, have liberally seconded the author's efforts by allowing the investigation to be made so far as was consistent with due progress of the work in hand.

FIREPROOF CONSTRUCTION.

A FIRE occurred lately in the factory of Messrs. Henry Cooper & Sons, in Roden Street, Nottingham. Fortunately the Dennett system of fireproof construction had been adopted in the building, and, in consequence, there was as little structural damage as was found after the great fires at the Haymarket Stores in 1881, and at Messrs. Bartram, Harvey & Co.'s premises, Staining Lane, E.C., in 1883. In the latter case, but for the efficiency of the system, there must have been as great a destruction of property as followed the Wood Street fire.

In a leading article in the *Nottingham Express* we find the following commentary on the manner in which the Dennett system withstood the fire :—

The fire which occurred in Messrs. Cooper's mill quite recently bears adequate proof that the system is all that it claims to be. Our readers will doubtless remember that during the night of July 29 a fire broke out on the fourth floor of the factory. The fire raged with great fury for some time. That the heat during the time the fire was in progress was intense may be gathered from the fact that the glass in the windows was fused, one or two thick iron shaftings were twisted with the red heat, whilst two or three valuable lace machines appeared as if they had just passed through a fiery furnace. But notwithstanding the terrific heat, the board flooring was hardly damaged, whilst the concrete ceiling above received no damage beyond being discoloured by the volumes of flame and smoke which, aided by a strong draught of air from the open door, rushed along close to the ceiling and belched forth from the broken windows. An inspection of the room above, however, will show the fireproof qualities of Dennett's system, even more strikingly than in the room below. In this top storey was stored a large quantity of light and combustible material besides some delicate lace machinery, but not a single thread in the whole room was even singed, and this is truly wonderful considering the fierce heat which was raging within 4 inches of paper parcels containing valuable laces. The origin of the fire will perhaps never be really known, but it is firmly believed to have been the work of an incendiary, because afterwards, we are informed, bits of firelighters, &c., were found in various parts of the room. If this is so, then the person made a woeful mistake, for it would be next to impossible—if not practically impossible—for the factory to have been burned down. What the consequences would have been had it not been fireproof it is not easy to say, but it is almost certain that the building itself would have gone, whilst those most intimately acquainted with the premises hold that the surrounding factories would have been fired as well. Thus here is an instance of the prevention of what might have been the most disastrous fire that had ever happened in Nottingham simply through the flames being unable to find their way through the fireproofing of the room in which they originated. As it was, however, there could not be the possibility of a fire of such magnitude. This particular fire has established beyond doubt the fact that in a building having such fireproof floors an outbreak of fire can be confined to the room or storey in which it originates, and those of our readers who are owners of large buildings would do well to visit the scene of the fire in Roden Street, where Mr. Henry Cooper will with pleasure allow them to judge for themselves upon the efficacy of Dennett's system. Certain it is that if buildings of this description were more common there would not be the number of serious fires there are, and in these days when insurance companies are chary in issuing premiums it would indeed be better for all parties were this fireproof system introduced not only into all mills, factories, warehouses, workshops, but public buildings and private houses of all descriptions. The great number of important buildings upon which the patentees have been employed during recent years, and the extensive and continued use of the system of fireproof construction by the most eminent architects of the day, afford the best guarantee of its excellence.

The *Nottingham Journal* is no less emphatic in bearing testimony to the power of endurance exhibited by the arching on the occasion :—

There can be no doubt as to the truth of the statement that the patent fireproof floors, manufactured by Messrs. Dennett & Ingle, Station Street, were put to a severe test at the fire which took place recently at Messrs. Henry Cooper & Sons' lace factory, Robin Hood and Roden Streets, Nottingham. The floors are formed of concrete, and in the room in which the fire broke out are about 18 inches thick. This depth of 18 inches is "over all," including woodwork, &c. The thickness of the Dennett arching is 4½ inches in crown, with a rise of 5 inches, there being beams below this to which machinery is fastened, and above joists which support the wooden floors of the rooms above. The chief thing noticeable as giving conclusive evidence as to the intensity of the heat is a 3-inch line shaft 9 feet distant from the floor, which is considerably twisted and contorted. A number of Lever's lace machines are also badly damaged, the iron in some of them appearing to have been at a white heat, whilst the woodwork is almost, if not entirely, destroyed. Some large iron girders in the room are twisted into all manner of forms, whilst some zinc at a distance from the floor has evidently been melted. A gas meter also exploded in the room, whilst the windows shared in the general destruction. The heat appears to have travelled along the top of the room and along a passage into a room occupied by a Mr. Priestley, a door at the entrance of which was entirely destroyed, part of the partition between the two rooms sharing the same fate. The fire was entirely confined to the room in which it originated, thanks to the floors with which the fifth storey was laid. The room in which the fire occurred was situated in the fourth storey, and the floor to the storey above acts as a preventative against the firing of the room below. In a room directly over the spot where the fire must have been the hottest, there was stored a large quantity of combustible material and delicate lace machinery, which is none the worse for the heat to which it has been subjected. The factory occupied by Mr. Cooper stands in the midst of a number of others, which would undoubtedly have caught fire, and inevitably would have been destroyed, but for the floors with which the factory in question was laid, and there is no knowing where the catastrophe would have ended. We can congratulate our townsmen, Messrs. Dennett & Ingle upon their invention, and feel sure that it will be more appreciated in future, now that its usefulness has been thoroughly tested. Fire insurance companies will be sure to make large abatements in their premiums on those buildings that are protected by it.

The following letter has been received from the proprietors of the factory by Messrs. Dennett & Ingle :—

"Roden Street, Nottingham : August 10, 1886.

"Gentlemen,—The fire which broke out on the fourth floor of our factory during the night of July 29 last, most satisfactorily tested the value of your fireproof floors, as the fire was confined to the floor on which it broke out.' The construction was evidently subjected to intense heat, as 3-inch iron shafting fixed at 9 feet above the floor was considerably twisted and contorted. On the floor directly over the spot where the heat was most intense was a large quantity of highly combustible material, and also delicate lace machinery, but not a thread was even singed. There is no doubt that if the building had not been fireproof the other two wings, and probably the adjoining blocks, would have been destroyed. In our opinion this establishes the fact that in a building having such fireproof floors, an outbreak of fire can be confined to the room or storey in which it originates.—Yours truly,

"Nottingham. HENRY COOPER & SONS."

The experience in Nottingham confirms what was hitherto known about the value of Messrs. Dennett's arching, and which has shown itself to be entitled to be considered as *par excellence* the fireproof system. In order that opportunity might be afforded to judge of the results of the fire, Messrs. Henry Cooper & Co. will allow their factory to be inspected on any day from 3 to 5 P.M.

Bygones.

"*Antiquity after a time has the grace of novelty.*"—HAZLITT.

DILAPIDATIONS IN 1807.

THE essay by Samuel Beazley, of which we gave an account last week, suggests what was thought of Mediæval architecture by a few men in the early part of the century. The following essay, which also was read at a meeting of the London Architectural Society, is interesting as an abstract of the practice in respect of dilapidations at the same period. It is no less useful now. The author of the essay was Joseph Woods, jun., the president of the society. It will be seen that among the experts who gave him advice was Mr. J'Anson, the father of the President of the Royal Institute of British Architects. We may say that, in respect of questions relating to the survey of house property, the name "J'Anson" corresponds with "Chitty" in respect of legal questions. Mr. Woods' paper was read on January 9, 1807 :—

The great uncertainty attending the surveys of dilapidations, and the very different value affixed to them by different surveyors, have made me think it desirable to endeavour to point out some standard by which one might ascertain exactly what (under the common forms of leases) came properly under the term "dilapidations," and at what rate they ought to be valued. In attempting this I have met with two important, and I fear insuperable, difficulties. The first is, that most of the cases are referred out of court, or, if decided in it, are not thought worth recording. The other, the varying opinion of the judges, who have decided in similar cases so differently, I had almost said so contradictorily, that they seem to have considered the law on this point as entirely in their own breasts. What information I have been able to gain on the subject I now venture to lay before the society, requesting their indulgence for my deficiencies. I have, indeed, done little more than arrange and collect into one view what I could find on the subject in the second edition of Woodfall's "Law of Landlord and Tenant"; but the assistance of my friends Mr. J'Anson, Mr. Savage, and Mr. Turner, who have been kind enough to communicate their observations on the subject, and especially of the latter, who has taken the pains to examine all the authorities cited by Woodfall, has enabled me to render my essay much more perfect than it would otherwise have been possible for me to have made it. Still, however, there are some points on which I cannot produce any authority, and am obliged to set down opinion instead of law. My object has always been to detail what is rather than what ought to be. The law as it now is must be in all these cases the rule of our conduct, and, even if I were able to take upon myself the office of a lawgiver, I think that the accurate knowledge of the regulations which do exist, and as far as possible of the reasons for them, is a necessary step to the understanding of what ought to be. It appears to me that my subject is a useful one, but by no means generally interesting. As, therefore, I cannot expect to amuse, I will endeavour to avoid being tedious by compressing what I have to say as much as possible.

It is sometimes the practice to begin with a definition of the terms about to be employed; my essay is little more than a definition; dilapidations are, however, taken generally, whatever at any given time in a house occupied by any other than its owner is worse than it ought to be.

The owner of any tenement, who lets it on lease to another, has a right to expect that it should be delivered up to him, at the expiration of the term, in as good a condition as is consistent with the necessary decay and deterioration produced by time; and that the tenant should make good whatever it may have suffered by accident or neglect, and that as well in what has been erected by the tenant as in what was originally demised. If the tenant has failed in this respect, he is consequently bound to pay to the landlord a sum equal to the difference in the value of the estate between what it is and what it ought to be. This, I think, is the principle on which all demands for dilapidations are grounded.

In some cases, however, it appears that the tenant has a right to remove what he has himself put up. The essay will therefore divide itself into two parts. In the first, I shall endeavour to point out what deteriorations may be legally considered as the effect of time, and what are to be accounted dilapidations; in the second, I shall attempt to explain what buildings and fixtures are the proper subjects for a charge for dilapidations, and what the tenant has power to remove.

If the lease of a house be granted for a lessee to do with at his pleasure, the lessee is not at liberty to destroy or pull it down (J. Doddridge 2 Rolls, R. 74, cites 17 E. 3, 18 E. 7); and as waste is partial destruction I think he must be considered as bound to repair.

It appears (Woodfall 312, 2 Atk. 383) that a tenant for life shall be obliged to keep tenants' houses* in repair, even if he be such, without impeachment of waste, and the same takes place with a tenant at will; for the tenant ought, in justice, to restore the premises in as good a plight as they can be, consistently with such deterioration as is unavoidable; but a yearly tenant (and by consequence a tenant at will) is bound only to tenantable † and not to lasting repairs.

If no covenants are inserted in the lease (Woodfall, 312), the common covenants to repair, maintain, and uphold are always implied, and the lessee is as much bound by them as if they were expressed.

If these covenants are expressed the tenant is bound to keep the premises in repair, and if he should neglect to do so, the lessor, at the end of the term, may claim a sum of money for that purpose.

Whatever injury the tenant has done himself, or permitted to be done by others, to the premises, whereby the estate of the lessor is diminished, is clearly a dilapidation, and chargeable as such; whatever injury has taken place by accident is also a dilapidation.‡ It remains to consider the injuries occasioned by neglect.

The rule to be observed in determining what injuries are dilapidations, is that fair wear, without accident, is not a dilapidation; but that wherever there is any degree of accident, it is one. The difference between "accident" and "wear" appears to be that the latter takes place gradually and insensibly, the former suddenly and perceptibly; thus the nosing of a step may be quite worn away, and it shall be no dilapidation; but if from any cause whatever the nosing have been broken away, instead of worn, it is a dilapidation.

Perhaps this definition may be thought to leave too great a latitude to the word "accident," as it includes circumstances that occur without any apparent reason for their happening at that particular time rather than at any other; thus, if the timbers of a floor decay, the floor will perhaps give way at a time when there was no particular stress upon it; yet I think common language will justify me in terming such a circumstance an accident; and, besides, it appeared that I could express myself more clearly and concisely by using the word in this manner. Wherever accident has taken place, not only the accident itself is a dilapidation, but all injuries arising to the building therefrom. I believe I shall be better understood if I mention a few particulars.

If a building be covered by weather-boarding, and the weather-boarding decay by age, as long as it forms an entire and complete covering it is no dilapidation; but if it be broken or fallen down in any part it is a dilapidation; and if, owing to a neglect of repairing it, any internal work be injured, this injury is a dilapidation, although no further accident take place, for it is a consequence of the first accident. If a timber decay, supporting any part of the house, it is not chargeable as a

* In the case cited, Lord Hardwicke overruled an exception to a master's report, by which a tenant for life without impeachment of waste was charged with several sums for the repair of tenants' houses on the estate. No authority is cited for this doctrine, and it rests entirely on Lord H.'s dictum, and it would, probably (if it be law), only hold where leases had been granted, and not where a tenant for life, without impeachment of waste, had suffered a mansion house, &c., to fall to decay.

† Tenantable repairs extend only to the finishing, and not to any part of the skeleton of a house; they include all the work of the joiner, plasterer, and glazier, but not to that of the bricklayer and carpenter; stopping out wind and weather are, however, included in tenantable repairs.

‡ Woodfall is not very clear on the subject of accidents by fire. He says, p. 293 :—"If a house be destroyed by tempest, lightning, or the like, which is the act of Providence, it is no waste; and the statute 6 Anne, c. 31, enacts that no action shall be prosecuted against any person in whose house any fire shall accidentally begin, with a proviso that the Act shall not defeat any argument between landlord and tenant." Again, p. 326 :—"At common law lessees were not answerable to landlords for accidental or negligent burnings; then came the statute of Gloster, which by making tenants for life and years liable to waste without any exception, consequently rendered them answerable for destruction by fire;" but now, "6 Anne, c. 31, the ancient law is restored, and the distinction introduced by the statute of Gloster, between tenant at will and other lessees is taken away; for, &c., &c." Yet, he adds, p. 327 :—"An exception of accidents by fire is now in many cases introduced into leases to protect the lessee, who would, as we have seen, be liable to rebuild in his covenant to repair." This is evidently contradictory, but it is now fully decided that the covenant does extend to all accidents of that nature.

dilapidation as long as it continues a sufficient support; but if it give way the tenant is bound not only to replace the timber, but also to repair all the damage done by its fall.

In external coverings the law seems somewhat stricter against the tenant than this rule would require, for if anything decay for want of attending to the coverings it is to be considered as a dilapidation, even if no accident can be supposed to have taken place.* I am not aware that this applies in any case except in that of paint; but I believe any decay arising from the neglect of painting is a dilapidation, but the paint itself is not one, unless by the covenant the lessee was bound to do it.

In one other trifling case the rule here laid down has an exception, which is in favour of the tenant: broken glass is not a dilapidation, according to some surveyors, unless there be more than one crack in the pane; or, according to others, while it remains sufficiently entire to exclude wind and weather; the first rule has the advantage of being the most precise, the latter of being the most reasonable. With this exception (and that of the neglect of covering before mentioned) the rule appears to be, as above stated, that wherever accident takes place it is a dilapidation, but where the one does not occur, no charge can be made for the other.

Having ascertained what are dilapidations (with respect to the premises acknowledged to be part of the landlord's estate) it remains to say a few words on the value of them as chargeable on the lessee at the expiration of his term. It appears that the tenant was bound to keep the tenements in repair to a certain degree, but not to deliver them up as new. He was not, therefore, bound to use new materials, but only to leave the house as good as it would have been had no accidents happened, and the coverings been properly attended to. All, therefore, the lessor can claim is a sum sufficient to enable him to effect this purpose. That the lessee had an opportunity of doing it at a cheaper rate than the lessor is of no consequence, as by permitting the term to expire he has lost that opportunity; nor is it of any consequence to the tenant whether the money so demanded is applied, or intended to be applied, to the repair of the tenement; or, indeed, whether the tenement be in a situation in which it can be repaired with advantage; he was bound to give up, at a certain time, something of a certain value, and if that thing be of less value than it ought to have been it is just that he should pay the difference.

But as it is not easy to decide what is the market price of old materials, it becomes necessary to refer to that of new as a standard, and as the claim of the lessor is greater in proportion as the premises have had less wear, it will not be just always to preserve the same proportions. If, for instance, a new house have been leased for six years, the owner may reasonably expect that no part of it should be much the worse for wear; whereas if it had been leased for sixty-six years, a considerable general decay must necessarily have taken place. Thus much must be left, ultimately, for the judgment of the surveyor; but I think that hardly any case could justify a demand of more than three fourths of the new value, and that none would occur in which one-fourth might not be fairly demanded. A covenant to leave the house in as good a plight at the end of the term as when the lease was made, appears to be no stronger than a common repairing lease.†

I now come to explain what are, and what are not, subject to dilapidations. It is evident that whatever the tenant has power to remove during the term cannot be justly chargeable with dilapidations: for if it be acknowledged that by leaving them at the end of the term he relinquished his right to them, yet the claim of him in reversion can only take place at the time they are so left, and he must take them such as they are as a gift from the tenant. If, therefore, we can ascertain what may or may not be moved, we shall also ascertain what are and what are not subject to claims for dilapidations.

The old rule is, that whatever is built upon the ground or affixed to the building are fixtures, and I believe it will be best to consider this as the rule now, and to enumerate the exceptions. All that the tenant received from the lessor he is certainly bound to restore in as good a plight as may be; all that he builds or puts up himself, that is fixed, he is also bound to yield up in good condition to the lessor. But over what is not fixed the lessor has no claim. Thus the lessee may erect barns, or sheds, or any building upon wooden blocks lying upon the surface of the ground, and take them down if he pleases without putting up anything else in the place; but if the barns are fixed into the ground they become the property of the lessor. The first exception is, that all buildings erected for the purposes of trade are removable; thus not only ovens and coppers may be taken away, but workshops and manufactories may be removed, provided they were erected for that purpose merely. This exception seems at first only to have been in favour of wooden buildings; but Lord Kenyon observed, in the case hereafter mentioned, that a brick chimney would not prevent a tenant from removing a building, and decided that its being on a brick foundation would not do it; and though his opinion was not followed by Lord Ellenborough, yet that judge did not decide on the cause before him that the tenant had no right to remove the buildings because they were of brick, which was the case, but because they were erected for the purposes of agriculture, and not for those of trade. In the case alluded to as decided by Lord Kenyon, the tenant was permitted to take away the buildings he had erected for the purposes of agriculture, though there was an express clause in the lease that all buildings made by the tenant should be left at the expiration of the term. But it is to be observed that, though the subject was agriculture, Lord Kenyon talked of nothing but trade, not attending to the distinction maintained by former and subsequent judges; and his opinion was in consequence neglected by Lord Ellenborough in the decision of an after case of the same nature, who observed, at the same time, that the cause just mentioned had not undergone the subsequent review of Lord Kenyon and the rest of the court.* But as it is perhaps impossible to draw any exact line between the purposes of agriculture and those of trade, as the barns of the farmer are as much intended to keep the corn for sale as the warehouses of the merchant, it is not to be wondered at if the decisions are not always consistent in this point.

This is the only exception with regard to buildings; but of what are called fixtures, many are now permitted to be taken away which were formerly considered to make a part of the house. "Marble chimneypieces may be removed, and partitions," and even wainscotting, if it have been put up with screws. It is to be remembered that in all cases the lessee is obliged to leave the premises in as good condition as if his improvements had never taken place. Thus, if he pull down a wooden chimneypiece and put up a marble one, he is bound, on taking the latter away, to replace the former, or one of equal value. If he put up a partition and take it away again, he must repair any damages which the adjacent work may have suffered by that means, and with this restriction, I believe, almost all fixtures may be removed during the term unless there are express covenants to the contrary.

REVIEWS.

Fantaisies Décoratives par Habert-Dys. Paris: Jules Rouam. London: Gilbert Wood & Co.

French artists receive such a sound training that it is not difficult for them to imitate the characteristics of diverse styles. No sooner did Japanese work become popular than a Franco-Japanesque style was produced, and it was as true in its way as Neo-Grec in architecture. M. Habert-Dys has often embellished the pages of *L'Art* with borders, head and tail-pieces, which show a most exquisite fancy in dealing with the things which are the elements of Japanese decoration. But he was restricted in scope, as it was necessary to keep his design subordinate to the printed matter, and he had not the advantage of colour. In the "Fantaisies Décoratives," which are now in course of publication, the artist is able to do more justice to himself. In these plates, M. Habert-Dys enters boldly into competition with the Japanese ornamentists. He can draw birds, flowers, fishes, insects, with as just a recognition of natural qualities as they can, but he has more science, and when he introduces the human figure or a bit of conventional ornament he surpasses the eastern artists. It will be said

* I have been inclined to doubt, from the expressions of Woodfall, whether in dilapidations arising from neglect of coverings the coverings themselves were to be estimated as such. His words are these (Woodfall, 293, Co. Lit. 53-4, and notes):—"Waste may be done in houses by pulling them down, or suffering them to be uncovered, whereby the rafters and other timbers of the house are rotten, but the bare suffering them to be uncovered, without rotting the timber is not waste: so if a house be uncovered when a tenant cometh in, it is no waste in the tenant to suffer the same to fall down." I have added the last words to show that the expression "the bare suffering them to be uncovered" does not mean to "remain uncovered" but to become so. But the decisions of the courts and the practice of surveyors are decidedly averse to such an interpretation.

† Woodfall, 325 Fita Abr. T. cov. it f. 42 Esp. R. 590.

* In a case lately tried at Guildford before Judge Grose, The City of London *v.* Varnham, an attempt was made to establish a difference between buildings which could be used only for the purposes of trade and those which, though built and used for trade, were yet convertible to the purposes of agriculture. Varnham had erected and removed buildings of both descriptions to the value of 1,400*l.*, of which those which might be used as barns or granaries were estimated at 1,000*l.*, and for this sum the action was brought; but though the amount was not disputed, the jury gave a verdict for only 300*l.*, thus fluctuating between two opinions, and deciding in a manner irreconcilable with either. I have not, however, complete confidence in my authority as to particulars, and there may perhaps be some important inaccuracy in this statement. At any rate, so arbitrary a distinction, and an inconsequent verdict, can hardly be pleaded as a rule for future decisions.

perhaps that M. Habert-Dys cannot sufficiently forget himself, and therefore cannot have the Japanese *naiveté*. But that is a compliment to him. His work is like a free translation into the purest Paris French of some of the old legends. There is no use in exactly imitating a piece of Japanese work, for the original is sure to be better than the copy. What M. Habert-Dys does by close study (aided by an affinity of nature) is to inflame himself with the spirit of the old artists, and to design while under its influence. We trust that we shall not offend enthusiasts by saying there is no *soupçon* of barbarism in his designs, and that in all his forms there is a daintiness of execution which is enough to excite envy in any Japanese workshop. The artist has been true to the title he gives his work. All the plates are fantastic and decorated. Thus, in his first number, he starts with a hand-screen, which has for subject a troop of geese crossing a foot-bridge. The composition is broken, according to Japanese canons, by a vertical band of ornament on a gold ground. In a second, which serves for a fan, there are birds on a golden ground placed against a stormy sky. A series of four panels show dogs, cats, birds, and monkeys, posed as if they were having portraits taken; while what seem to be flowers at first sight are found to be heads of the subjects. Air, earth and water are alike under the sway of the artist. Here he gives us a flight of birds in all the *abandon* of life; in another place we have a shoal of fishes, who have no less enjoyment; elsewhere a procession of mice serves as a border. Like a conjurer he takes a few insects and makes a bracelet out of them, or he puts a few fans together and we have a novel pattern for a stuff. We see a cat meditating, in a placid, philosophic way, over a group of cows, and possibly thinking of the good arrangement by which they are upheld for her food; a cow, who appears to have turned poet and to be apostrophising the sun; a lobster, who is as eager for prey as any usurer. But in none do we see a trace of the exaggeration which is so often found in the clever burlesques of M. Regamey. M. Habert-Dys has as much controlling power as invention. His fantaisies are the best of all Western attempts to work on Japanese principles, and they can be recommended as inspiriting works for designers.

SPECIFICATIONS FOR PRACTICAL ARCHITECTURE. By FREDERICK ROGERS. Second Edition. Crosby Lockwood & Co.

The collection of specifications prepared by Mr. Rogers on the basis of Bartholomew's work is too well known to need any recommendation from us. The new edition has the advantage of being offered at a reduced price. Twenty-seven examples of specifications are given, comprising all the kinds of work that are likely to occur in ordinary practice. If the book were useful in no more than one case it would still be worth what is charged for it. It is one of the books with which every young architect must be equipped, for time has shown that the specifications cannot be set aside through any defects in them.

KELLY'S DIRECTORY OF THE BUILDING TRADES THROUGHOUT ENGLAND, SCOTLAND, AND WALES. Fifth Edition. London: Kelly & Co.

The importance of the building trades in Great Britain is suggested when we find that nearly two thousand closely-printed pages are required for the names of the representatives in this new edition of Messrs. Kelly's Directory. The volume is a masterpiece of compilation, and exemplifies the perfection of the organisation in the publishers' establishment. The French "Annuaire du Bâtiment," which is supposed to be an illustration of the French system, will not sustain comparison with this English work, either in arrangement or in execution. The French paper, type, and printing are far inferior to Messrs. Kelly's. We have tested this new edition in many ways, and can bear witness to its accuracy. Changes which have occurred since the compilers went their rounds cannot be called errors. We are informed in the preface that the "whole of the names therein have been personally visited by a large staff of canvassers, and the returns made by them have afterwards been arranged by a staff of clerks specially trained to the work." Thanks to so expensive a process, the Directory can be accepted as a trustworthy book of reference. People are too apt to take volumes of this class as mechanical productions, and overlook the labour that is necessary for their production. It may, therefore, be well to mention that the names alone of the towns and villages visited fill eighty-eight columns, and the index to the building trades fills six. However small may be the village, we have a clue to the people who represent building in it. One may have only a bricklayer, a mason, or a carpenter, but if there are other trades we are sure to have them. Thus, on opening a page by chance we find it contains Crewe, the railway centre. It gives the names of the architects, brick and tile makers, builders, builders' ironmongers, building material dealers, carpenters and joiners, gasfitters, gilder, iron gate maker, lime merchants, painters, paviors, plasterers, plumbers, sawyers, slate merchants, slaters, stone and marble masons, timber merchants, window-blind manufacturers, &c. The estate agents are also given. What more is possible? The Directory is indispensable in every office where business is transacted with architects or with any of the trades directed by architects. It is creditable to the publishers that they have spared no expense on this most useful work. The execution is superior to that of the last edition.

KELLY'S DIRECTORY OF THE ENGINEERS AND IRON AND METAL TRADES AND COLLIERY PROPRIETORS. Fifth Edition. London: Kelly & Co.

This is a companion volume to the one we have just described, and is on a similar plan; but as it relates to everybody who can be said to be connected with civil or mechanical engineering, it has more variety than exists among the building trades. In some cases it must have been difficult to draw the line between engineering and building, for a good deal of work is common to both departments. The two volumes being similar, what we have said in praise of one is no less applicable to the second.

NEW BUILDINGS.

Newcastle-under-Lyme.—Extensions have been carried out at the Union Workhouse. The new structure is built of dark brindled bricks effectively relieved by bright red terra-cotta quoins and facings, and it presents a substantial appearance. The building is connected with the present infirmary and workhouse by a covered way leading to the centre of the block. The newly-erected edifice comprises male and female wings to the left and right respectively, these being connected with an administrative central block by open staircases. Each wing possesses a day ward, general wards, and separation wards for special cases. The wings have ground and first floors, and the central block is provided with an additional floor, which takes the form of children's wards. The infirmary affords accommodation for 60 adults, 6 children, and 2 nurses, with the requisite provision in the shape of surgery, stores, cellarage, &c. The separate wards in each wing are provided with all the necessary sanitary appliances of the latest construction, and also with ample bath accommodation. A little distance to the rear a mortuary and other offices have been built, and each department has an enclosed airing yard. The completion of the infirmary signalises the carrying out of the first contract. At the earliest possible moment the inmates of the old hospital will be removed to their more spacious and adequately furnished apartments just finished, and the second portion of the extensions and improvements will be proceeded with. The contractor for the building is Mr. Richard Bradbury, of Stoke, and the work throughout has been executed in a highly satisfactory manner under the superintendence of the architect, Mr. John Blood, of Newcastle.

Portsmouth.—New Prudential Insurance Buildings have just been commenced at Portsmouth. Mr. A. Waterhouse, London, is the architect, and Messrs. Stephens, Bastow & Co., Bristol and London, are the contractors.

GENERAL.

Engravings representing *Interior of the Temple of Claudius*, *Doorway of the Pantheon*, *The Coliseum*, *The Tarpeian Rock*, *Temple of Venus at Rome*—all by Rossini—and *Jacob at the Well*—after Raphael—have been presented by one of the citizens to the Aberdeen Free Library.

A Statue of life-size of *St. Winifrid*, designed by Mr. Kirby, architect, of Liverpool, has been erected at St. Winifrid's Well, Holywell, in the beautiful carved canopy which has been empty for several centuries.

A School of Art was formally inaugurated at Malvern last Friday.

A Memorial Hall for public purposes is to be erected in Pitlochry.

Mr. P. Horsman, who gave an art gallery to the town of Wolverhampton, has now offered to defray the cost of providing and furnishing the in-patients' department of a new eye infirmary to be erected on the Merridale Road.

The Earl of Fife is about to erect a public hall in Braemar for the use of his tenants and the inhabitants of the district generally. The hall will be built entirely of Mar Forest timber on a stone base.

The Memorial Stone of the church of St. Mary, Stamford Brook, W., was laid on Monday last by H.R.H. the Duchess of Teck. The church is from the designs of Mr. Chas. J. Gladman, A.R.I.B.A. The works are being carried out by Messrs. Dove Bros., of Islington.

Earl Derby has given directions for the reservation of three plots of land in Bootle, for the building of churches.

The Bilston Town Commissioners have received the report of Dr. F. W. Barry, of the Local Government Board, on the sanitary state of the town, in which the erection of a suitable hospital for infectious diseases is recommended.

The Architect.

THE WEEK.

THE Committee appointed to arrange for the erection of an Art Gallery and Museum in Leeds confined the competition to the architects of the town, and fixed the sum to be expended at 8,000*l.* That sum is insufficient if the gallery is to be creditable to Leeds. A shrine for works of art ought, moreover, to be itself an example of art, which it cannot be if all the parts are to be grimly plain. The Leeds architects are dissatisfied, as they may well be, and the Council of the Leeds and Yorkshire Architectural Association have asked the Committee to reconsider the question. But the Committee are not to be moved into liberality. They consider 8,000*l.* to be enough for a gallery, and the Leeds architects are, therefore, placed in the unpleasant position of competing under conditions which make it impossible to produce a work of art.

THERE is the usual amount of discontent about the competition for the Edinburgh Municipal Buildings. It is objected that the system of sketch designs is not adopted. But the magistrates and council must be aware that there is not unanimity among architects in respect of the advantages of a preliminary competition restricted to sketches. The Glasgow competition was not between sketches, and corresponded with what is now proposed. Still a great many architects willingly took part in the two competitions for the municipal buildings. Another objection is raised against the absence of a guarantee that the author of the first design is to be selected to carry out the work. It would be better if there was no reserve, but we must remember how influential is northern caution. Architects are familiar with the saving clause which reappears in the advertisement of the latest competition for a public building, viz, the Lewes Public Hall. The first premium is "to sink into the commission, if the architect obtaining such premium shall be employed in the execution of the work." But if he is not employed he receives only 20*l.*, and his design becomes the property of the Lewes Council. In Edinburgh 250*l.* will be paid, and practically the authorities do not assume more power over the execution of the work than the authorities of Lewes.

THE application of the Richmond Vestry to raise 30,000*l.* to purchase the plot of land near the Hill, belonging to the Duke of BUCCLEUCH, is certain to be recommended for approval by the Inspector of the Local Government Board. If the ground is purchased, it will be unwise to sell one-half of it in order that the outlay may be diminished, and probably the proposal was only put forward to subdue the opposition. It is right that one of the finest views in England should be preserved, and if it were possible the big hotel and other buildings about the place could be removed with advantage, for it is not every one who believes that the finest view is improved by a hotel in the foreground. But if Richmond Hill is of national interest, it is hard on the taxpayers of the district that they should have to pay a large sum of money to give pleasure to strangers. It is one of the cases in which the Exchequer should make advances. A few subscriptions are promised, and it is imagined that the London Corporation may offer aid, but the money obtained in that way is not likely to do more than cover the expenses of transference. The local rates will have to bear the cost of purchase.

IF the present age is in need of a title it might call itself the Age of Examinations. They are becoming so general among us that it will be soon hard to decide whether the Chinese or the English give more encouragement to the principle. We see what examinations have done for the Flowery Land, and in a generation or two England may also be able to show that it is on the way to become pedantic and obsolete. The latest adherents to the fashion are the Glasgow measurers. It would be hard to discover men who are more useful to architects and clients. But they have resolved that their successors must follow a different route towards utility. Henceforth employés in offices are to be subjected to periodical examinations by means of paper. It is not suggested that the measurers will give confidence to their assistants by undergoing any test of their own adaptability to be crammed with "science subjects." The Committee for the Federation of Architects also see that the only hope of safety for the clients of remote ages is in the application of a rigid law of examination applied to architects. An ingenuous sort of a circular has been issued in which it is proposed to obtain an Act for the registration of all persons now in practice, however incompetent any of them may be; but the Act is also to make it imperative that from that day forth new practitioners must obtain a diploma of qualification as the result of test examinations, which will be instituted by men who have not been examined. This anxiety for the future is, we suppose, to be considered praiseworthy. But is it not likely that the people who come after us will be as well able to take care of themselves as we are? If they were to be imbeciles there might be some philanthropy in providing them with architects and measurers, but if our successors have to pay the penalty for our excitement in weakened brains it would be better to make provision about the bakers of the future. The wants of our own time are enough to exhaust any wisdom we may have.

IT seems difficult by means of competition to select a measurer that can cope with refractory contractors. But what is to be said to appointing clerks of works for public buildings in that way? Formerly the surveyors were able to recommend efficient practical men for the post. Some of those clerks of works attained a high position. The War Office was never possessed of a more able chief surveyor than the late Mr. MENNIE. He entered as a foreman in 1829, became a fourth-class clerk of works in 1838, and worked his way through all the grades up to a bureau in Pall Mall. Mr. SANDS, who at one time was well known to builders of barracks, was originally a fourth-class clerk of works, and we could name many others. Under the Office of Works it was impossible for a clerk of works to become a surveyor of the first class, for more acquaintance with architecture is expected than is supposed to be possible of acquirement by any one who held so subordinate a position. But the clerks of works under that department of the public service are, as a rule, competent officers. However, *doctrinnaires* have at length prevailed, and henceforth every foreman who aspires to be a clerk of works under the Government will have to go through the ordeal of a day or two in Cannon Row. His knowledge of carpentry and brickwork may be exact, but he may find himself "spun" because he cannot tell where the Yang-tse-Kēang has its rise, or write a page of the longest words in the language from dictation. NEMESIS has not overlooked the new arrangements. We know how often the Office of Works was supposed to condemn civil architects' work because of its sanitary deficiencies. It is now asserted that the system in vogue in Whitehall Place is antiquated. The candidates for the office of clerk of works are, therefore, expected to be *au fait* with the very latest doctrines which a medical gentleman may evolve as a means of advertisement.

HOLIDAYS are becoming imperative, and apparently everything must succumb to them. They have compelled people to suspend their curiosity about the French Exhibition of 1889. M. LOCKROY, the Minister of Commerce, has departed from Paris, and M. ALPHAND, who is arranging the plans, is also away. Until the end of September everything is left in suspense. Immediately after the vacation a start will be made, for the Champ de Mars is to be surrounded with hoarding, and tenders for the work are invited. The co-operative societies of working carpenters are eligible to compete. M. LOCKROY and M. ALPHAND have merited a long holiday, and we hope that when resting they will be inspired by a sense of the inapplicability of the proposed iron tower. It will increase the expenditure, and what will be the return? Does any one anticipate that a single visitor will be attracted by that mass of metal?

AN ARCHITECT'S SKETCHES.*

AN architect's collection of sketches that was not intended to gratify any eyes but the author's is always sure to give pleasure, and when the student of it is kept prisoner in London during the holiday season the gratification is enhanced. Sketches of the kind become records of impressions, and sometimes of hopes. A bit of detail is seen which is pronounced charming; but it is not possible to sketch all that is visible of that class. The thought arises, "It would be useful in such or such a building that may come off some day," and then it is sure to be transferred to paper. We can imagine Mr. DUNN entering foreign Roman Catholic churches, and, when struck with their beauty, asking himself whether the day will come for the erection of similar buildings in England? If it should, he at least will be provided with materials. In this way one sketch-book after another is filled. Then, as we are told, publication became an after-thought, and a volume of a hundred plates is the result.

We have no hesitation in saying that Mr. DUNN'S collection of sketches is among the most valuable of those which have appeared in our time. They are drawn in a style that sometimes suggests WELBY PUGIN and sometimes J. L. PETIT. But the style is controlled by the desire to secure something that is useful in every case. That breadth of effect which is so often sought, and which is not to be despised, is rarely introduced. In many cases a firm line is given where a lover of the picturesque would insist that a broken line was more suggestive. Mr. DUNN'S desire was to make the buildings give him hints, and the qualities which were not capable of aiding him become of secondary importance. Hence we often have small portions of interesting churches and buildings occupying a page, while elsewhere a large building may have only a couple of square inches devoted to it.

There are things in the volume which have been often drawn. The first plate, for example, is the beautiful lantern of St. Nicholas's Church, in Newcastle-on-Tyne, and the last is a part of the Hôtel de Ville, in Ghent, which is possibly more generally known. Then we have sketches from Bruges, Caen, Limburg, Nuremberg, Chartres, Oxford, and other places, which must be tolerably familiar to every English and American architect. But in the majority of the sketches we have reminiscences of scenes that are not on the beaten ground of tourists. Cairo may not be difficult to approach; but as much cannot be said of Spain, which Mr. DUNN has found fertile in subjects.

In his Cairene sketches it is tolerably evident that Mr. DUNN was most struck with the corbelling, and in the notes he jotted down he remarks that it is "very ingenious, and suggestive of Gothic construction." He gives several examples, which bear out his idea. The upper part of the doorway from Damascus is also confirmatory of that theory; but such capitals as are seen in that city are unknown in Gothic. The minarets given from Damascus are very beautiful, scientific, and therefore rational, in their construction. A door from Tunis is effectively ornamented, and without any of the profusion that is sometimes seen in Eastern work. The title of MALHERBE, the poet, is said to depend on his having taught the great power of a word when put in its right place. A similar principle should rule in decoration. Ornament acquires a new power if put in its proper position, and not elsewhere; but artists are not always disposed to recognise this truth. The door has a square framing, with a horseshoe arch. The outer ring of the arch has ornament at intervals, which is executed in nail-heads. In the two upper angles of the spandrels there are two plaques in which there is no correspondence except size—an assertion of liberty which is thoroughly Eastern. The door is sufficiently decorated, but there is no superfluity.

It seems natural that some plates from Spain should follow. The Seville doorway, with the bits of wall and ceiling decoration, show an affinity with what came first; and in the ciborium and towers at Tarragona we see the desire to express an upward-springing power with one of subordination, which are found in the minarets and domes of Damascus. The buttresses and finials of the ciborium form a masterly composition, and the interior must be no less interesting, for the spaces between the ribs of the groining are pierced through in tracery, besides being coloured and gilt. The upper part of the splendid Rodez tower no longer exists, and Mr. DUNN suggests how it may have been completed. No doubt, he writes, this is taking a liberty, but the excuse must be that the primary object of the sketches was study and improvement. A good many plates follow of towers and spires in different countries, and we suppose Mr. DUNN desires to suggest their Eastern relationship. St. Sauveur, Bruges, shows a more severe type, which is again seen in the Caen examples. In Palermo there is another variation.

The interiors begin with the cathedral of Barcelona: the arches are stilted and the reredos rises almost to the height of the capitals. As it is detached the mass of gilded work must have an imposing effect. The bishop's throne appears to be at the epistle or right side, which is unusual. It is suggested as a model for a Roman Catholic church on a large scale. One feature in it is the enormous thickness of the nave-aisle walls, which are deep enough to be formed into chapels. Another interesting church is the one that belonged to the Dominicans at Toulouse. It is divided by a row of columns down the centre, so that there is no nave. This arrangement is supposed to have been adopted to separate the sexes. There is a series of small chapels around the outer wall in the interior, and for a part of the exterior. In the east end of the cathedral of Alby we have an arrangement which is also suggestive.

We have next several plates, illustrative of parts of buildings. One is from the cloisters at Tarragona, in which round and pointed arches and traceried circles are well combined. The Tresor at Caudebec shows work of later type. Some beautiful altar tombs from Burgos and Toledo are given, as well as grandiose altars from Spain. Their effect is partly due to the treatment of the pinnacles, and a page of pinnacles from York, Lichfield, Caen, and Rouen does not seem out of place in this part of the book. The triangular porch at Ratisbon, the king's tomb in St. Chiara, Naples, the doors from Burgos, suggest what Gothic was when there was no necessity for the designer to be hampered by finance. Several examples of the "sacrament house" are also examples of that happy condition of affairs. The skill of the old masons in grappling with difficult problems of stone-cutting is suggested by the stairs of Heidelberg, Stutgard, and Chartres. The cantilevers at Caudebec and the corbelled windows at Marburg bring us once more back to Cairo. Then we have plate after plate to indicate the variety of ways in which roofs are treated in the old German towns. They are followed by examples of fireplaces and windows, which may be called variations of the lintel. We have also valuable suggestions for secular buildings from Marburg, Rothburg, Angers, and Louvain. Diagrams are furnished of the tracery in about twenty windows of different types, and the concluding plates of the book are a magazine of interesting "bits."

From what we have said it is evident that Mr. DUNN has laboured in an extensive field, and it would be strange if he did not glean much that was overlooked by travellers who went over the ground before him. One of the most marked characteristics of the sketches is their freshness. Representations of the buildings may be found in many volumes, but, so far as we know, the majority of the subjects are given for the first time. Europe is so rich that it is not easily exhausted, and we hope that Mr. DUNN may on another occasion produce a second volume similar to the one he has given. But every traveller will be ready to acknowledge that sketching is always easier on one's first visit. Afterwards the subjects appear to be familiar, and one is likely to suppose that they are known to all the world. If Mr. DUNN should not give us more sketches, we hold ourselves indebted for what he has done.

Mr. DUNN'S volume of sketches is exactly the kind of book that is useful in helping one out of a difficulty. From the variety and excellence of the subjects the pages can hardly fail to offer something that will be suggestive whenever they are consulted. The subjects are not indiscriminately taken, but have been selected because they appeared to be worth possessing as materials for practice, and we are confident that not a single page in the volume will be considered superfluous.

* *Notes and Sketches of an Architect.* By Archibald M. Dunn. London: B. T. Batsford.

THE MEDIÆVAL BAPTISMAL FONTS OF ENGLAND.

[BY A CORRESPONDENT.]

(*Concluded from page* 119.)

THE Decorated font at Kidlington* Church, Oxfordshire, is a good instance of a simple village church font. The circular bowl is of considerable depth, very slightly curved in external section, and having a small moulding at the top. The plan changes with excellent effect to an octagon in the bell of the capital under the bowl. The shaft is very short, and has base mouldings of bold proportions and vigorous projection. Altogether this is a very satisfactory instance of what can be done by good proportions and without any extraneous ornamentation whatever. The bowl is plain and unadorned, without even a circular or raised panel or a quatrefoil. There is no lurking ball-flower in the hollowed mouldings, nothing but purely moulded work. The same principle which is applicable to the humble font, little more than half the stature of a life guardsman, can most fitly be appropriated to the stately fabric of a cathedral some hundred feet or so up to the ridge of the roof. Turning from great things to small, the architect in designing fonts should be careful not to change his plan too often from plinth of base to capping of bowl. Many of the most elegant fonts are circular or octagonal throughout. With a square bowl, to continue the same plan all the way results in a somewhat clumsy composition. The writer wishes to lift up a warning voice against too much searching after novelty and change, and rather to inculcate the cultivation of thoroughly good proportions than eccentric or far-fetched striving after architectural legerdemain or *tour-de-force*.

The font to Heckington Church, Lincolnshire, in the Decorated style, is another example of that form of font not so unusual in this period, like that to Exton Church. It has a series of canopied niches, but unfortunately the figures have vanished.

The font of the same period to Woodstock Church, Oxfordshire, has a simple moulding with a hollow member containing ball-flowers. It is curious how seldom any enrichment of this kind at the top of the bowl occurs in ancient fonts. The example at Kiddington Church, not far from the last-mentioned, and in the same county, is hexagonal, and has rich traceried panels to each of its sides, like the octagonal font at Woodstock Church, and has also a moulding at top with ball-flowers.

Offley Church, Hertfordshire, possesses a very ornate specimen of a Decorated font, the bowl having angle buttress-pinnacles and ogee-shaped crocketted canopies, enclosing ornamental panels to each side. The shaft is also very rich, much cut up into parts, which to accurately describe would be difficult, and even then it would not be easy to understand.

That type of Decorated font which may best be designated as the "octagonal cube" is not uncommon. There is no particular beauty in the outline, as might be imagined, for whatever beauty exists is to be found in the enrichments. The specimens at Ewerby Church, Lincolnshire, and Poynings Church, Sussex, are cases in point. How far better it is to see a font the properties of each division of which are good and well studied—the massive simple base, the elegant shaft, the rich bowl! In such compositions the fifteenth century period is, as a rule, eminently successful.

The beautiful font at Redgrave Church, Suffolk, of the same style as the last-mentioned example, has an embattled top to it, a feature rather rare in fonts.

Stanwick Church, Northamptonshire, contains a very ornate specimen of the transition between Decorated and Perpendicular. Each side of the bowl is richly panelled, and there are small pinnacled buttresses at each angle, also crocketted and finialed pediments, &c. The piers of the pinnacles are rather curiously arranged, as they are not vertical but on a curve, following the outline of the lower part of the bowl. The shaft is missing. There is a broad, chamfered plinth or base, enriched with four-leaved flowers as well as richly panelled. But the whole design is rather overdone; it would really have looked better if less ornament had been bestowed on it.

* Not to be confounded with that to *Kiddington*, another church not far off, commented on hereafter.

The grand series of Perpendicular fonts have yet to be commented upon. Let us begin with that of the church of Bradford Abbas, Dorsetshire, a specimen of an elegant and unusual design, having no central shaft, but instead, four detached square panelled piers at its angles. These are carried up to the bowl, with which they are almost flush, giving not only the idea but the reality of actual support. In the Perpendicular era, in the matter of fonts just as in other architectural features, there is a want of variety in the designs, certainly much more so than is to be found in earlier examples. However interesting and pleasing to the lover of heraldry, yet as a matter of ecclesiastical propriety the practice of making coats-of-arms a part of the decoration to fonts cannot be defended. It is not intended to maintain that shields bearing arms must nowhere be put in a church. But they are certainly out of place in a font where earthly distinction should vanish. For here the adult or infant of every degree is admitted into the Christian fold. No such objection applies to shields not bearing heraldic devices, but used only decoratively. They then become most useful and pleasing features for representation of the emblems of the Crucifixion, or other sacred and appropriate devices.

An excellent example of the proper treatment of a Perpendicular font is to be found in Taynton Church, Oxfordshire; this is octagonal and has a most substantial-looking and massive base. It also possesses a shaft of ample diameter, each side of which is delicately panelled in three divisions. The capital under the bowl is handsome and well moulded. But its only other decoration, besides the series of mouldings, is in the sculptured figures in the bell of the capital at each angle. The vertical part of the bowl is divided horizontally into two bands, the upper one projecting beyond the lower, the whole being richly carved. The simple capital and the plain base, contrasted with the elegant shaft and the carved bowl, certainly combine to render this font an exceptionally good specimen of Perpendicular composition. It might perhaps have been better not to have divided the bowl horizontally into two such narrow divisions, but this seems the only fault to find in the design.

The octagonal font to Ensham Church, Oxfordshire, is certainly, to the writer's mind, unique in its design as regards the bowl, which somewhat resembles an Early English double-belled capital, though of the Perpendicular period. There is a rich moulded capping at the top, and then a cavetto moulding, deep as regards its height, but yet shallowly recessed. The latter is, however, prudently filled up towards its lower part by angels with outspread wings, occurring at each angle of the font. Then come some more mouldings, and under these two four-leaved flowers to each side. It was repaired many years since, before the regular era of church restoration had commenced, and one wonders whether this seemingly unique example was then really faithfully and conservatively restored.

The font at Ewelme Church, in the same county, is a more elaborate example of Perpendicular work, but is not equal in composition to the last named. The base is too slight for the superstructure, and the panels to the bowl not being square, but oblong—*i.e.*, less in height than length—are not pleasing, and are, moreover, cusped in an inelegant manner. The magnificent oak cover, with its forest of pinnacles and spire-like outline, is well known and needs no further comment here.

The Late Perpendicular octagonal font to Cold Ashby Church, Northamptonshire, has also a very curious and unusual bowl. The top is deeply embattled, one large embrasure to each side. The embrasures, of course, are not cut through the whole thickness, but are stopped at the back, leaving sufficient substance of stone behind. The remainder of the bowl is perfectly plain. The large embattlement is a quaint conceit, giving the notion of the font having been looked upon by its designer as something to experiment upon.

In Cambridgeshire, at Leverington Church, is about one of the most ornate fonts of the period now treated of. There is scarcely a single part of it left plain, the base and shaft being fully as rich as the bowl. It abounds with sculptured figures, such as bishops represented sitting, pinnacles, crockets and finials, roses, &c. In fact, it is a com-

plete repository of the architectural details of the Perpendicular style.

The font at Covenham St. Mary Church, Lincolnshire, is of the same period, and an instance of one of those anomalies in the form of font. But at the same time it can be called elegant, which is by no means always the case with anomalous objects. The shaft is hollowed out into a shape difficult to explain without illustration. The octagonal bowl possesses small corbels dying into these "flutings" in the shaft, which in its turn sits upon a square base. The latter has peculiar shaped "steppings" at its angles. Altogether this adds another to the long list of remarkable fonts.

A good specimen of a panelled shaft of Perpendicular date is to be found to the font at Yate Church, Gloucestershire. The panels are square-headed, and do not look "fussy," or disturb the repose of the composition, as too many do.

Another Perpendicular font, that at Fakenham, Norfolk, has almost disengaged shafts at the angles at the bowl, which have the fault previously commented on when found in modern fonts. Such examples are not uncommon in the Middle Ages; the shafts carry nothing, and are really only ornamental "dummies." It is too much the way at the present time to defend, or, at any rate, to excuse, the deliberate violation of "true principles" where ancient precedent for so doing can be adduced. In some rare instances the violation may be condoned, and the master-hand may have thrown such an attractive veil over what is in reality a deformity or abortion that it is passed over without adverse criticism. The miniature buttresses with diminutive make-believe water-tables, of which so many examples are to be found in old Perpendicular benches, always offend the writer's eye. For when such projections in woodwork are required, for constructional or other reasons, it is quite possible to treat them in a more legitimate way.

At Ufford Church, Northamptonshire, is a good instance of a kneeling stone to a Perpendicular font. It is remarkable how in modern examples so little decorative employment is made of so useful and essential a feature. The platform and steps on which the font rests should receive more attention in the planning than they often do. When there are several steps and the font is of elaborate character, the risers might be made ornamental and projecting moulded nosings put to the steps. This would add greatly to the dignity of the font.

The writer must not close these remarks without just mentioning a kind of baptismal shrine in which the font is enclosed, of which there are a few rare examples in England, such as the noteworthy one in Luton Church, Bedfordshire. Here the font is enclosed within an octagonal stone screen, having its lower part filled, except at the entrance, with panelling, while the upper part forms a groined canopy. Another enclosure of this kind, but of wood, exists at Trunch Church, Norfolk.

To enter upon the subject of font covers would be to open up a new and rather wide field, and would be foreign to the scope of this article. But it is worth alluding to that most curious example at Fingeringhoe Church, Essex, which is octagonal in plan and has an open ogee-shaped top, formed of several crocketted flying ribs. Two of the sides open like a cupboard door. The interior of the cover has a flat ceiling, ornamentally panelled.

Though so many fonts have been carefully criticised and described, numbers of very interesting ones have been left unnoticed, because their name is really legion. What a valuable work it would make were a book published illustrating every ancient font in England, each drawn to scale. Fonts are easily measured and readily accessible! In foreign countries the Government might undertake such a task, but we have little expectation of it in our England.

There is an almost boundless field of variety in the designs of fonts if the zealous architect will but apply his mind to it. He can be thoroughly original without courting eccentricity.

A Roman House has been discovered in clearing the ground for the new foundations of the buildings of the Banca Nazionale in Rome. It is said to belong to the third century. The walls have paintings, as it seems, of Biblical subjects, mixed with some mythological figures—*e.g.*, Pegasus on Helicon, Æsculapius with his serpent, and Muses.

THE DEGRADATION OF VERSAILLES.

THE interest that is taken in the terraces, fountains, statues, and vases of Versailles is not confined to France, for it is almost universal. No apology is therefore needed for offering a translation of the article by M. Henri Vuagneux from the *Figaro*, which contains a detailed statement of the condition into which the park has been allowed to fall.

If Le Nôtre and Mansart could leave their graves for an instant, says M. Vuagneux, and visit the groves which were created by them, the two architects in their despondency at the sight would be sure to declare that the great work which crowned their career was no longer worthy to survive them, for it was likely to efface their renown. The Marvels of Versailles, that were no less celebrated than the Hanging Gardens of Babylon, and which have astonished the world for two hundred years, will soon become no more than legends.

It is only those who have carefully examined the four or five hundred works in marble and bronze which stud the parterres of Versailles, who are in a position to give a precise account of the rapidity with which the destructive agencies are depriving us of the masterpieces of Adam, Coustou, Coysevox, and of other French celebrities of the seventeenth and eighteenth centuries.

If we were not aware of the insufficiency of the sum which is doled out for the preservation of the place, we might charge the administration of the Beaux-Arts with the whole responsibility of the disaster, in which case the architect of the Palace of Versailles and the conservator of the Museum which is there placed would be reprehensible. But it is too evident that the cause of the ruin which menaces one of the glories of the country rests entirely with the Chambers.

It was bad enough to have subjected to useless transformations that marvellous salle-de-spectacle which was an eighteenth-century chef d'œuvre, and the only one of its class in existence. But it shows an inconceivable want of vigilance to allow the elements to accomplish the work of destruction. Not only have the rain and the sun left many a deep fissure, but not one of the works of art in the park has been exempted from the mutilations of barbarians who cared little for the guardians, and were oblivious of that love of art which at one time distinguished the country. It is painful to contrast this conduct with that of the Germans who, when they were masters of Versailles in 1871, treated with respect all the vestiges of a great epoch.

Upon the terrace of the palace in front of the Salon de la Paix is the great vase sculptured by Tuby. The handles take the form of heads of satyrs. The horns are broken, and the socle, which is of rose marble, is cracked in several places. The companion vase, which is by Coysevox, and with similar handles, is split from top to bottom; the water escapes through the cracks, stains the marble and is causing its decay.

The two great vases of Egyptian marble by Mazière and Rousseau, which are on the coping of the steps near the chapel which lead to the lower parterre, are in a deplorable condition. The marble is being eaten away by the moss, fragments of the necks are lost, and parts of the feet. They are menaced by ruin. Near these vases, and forming a pendant to the *Crouching Venus* of Coysevox, is a bronze reproduction by Keller of the antique *Rémouleur*, or the *Sharpener*, in the tribune of the gallery of Florence. It has a rent in the right forearm and wrist, which is about 7 inches long.

On descending to the parterre we find serious injuries to the two vases by Bertin, which are decorated with branches of vine bearing fruit, with young fauns forming the handles. There are hollows in the marble, and the figures are defaced. The two crown basins are abandoned; great weeds have pushed their way between the plaques of the borders, which are disjointed and blackened by the moss and dirt. The tritons and sirens, by Tuby and Le Hongre, that form the central group of the basins, are decaying under the yellowish deposit. The Fontaine de la Pyramide, with its sculpture in lead by Girardon, is in as defective a state as the neighbouring basin, the borders being disjointed, and in the interstices aquatic plants are growing. In the large vase at the bottom of the basin the water is allowed to stagnate, and is exhaling a miasma that must be dangerous to the health of the crowds of children who walk about the fountain. The part of the basin at the side of the cascade is bending down; the water also leaks from the basin of the latter to the side of the fine relief of the nymphs by Girardon. The lower part of the vase is encumbered with weeds, stones, and detritus of various sorts.

The statues which adorned the space around the Parterre du Nord, and the steps leading to the grove where is the Bath of Apollo, now seem like scarecrows to frighten the birds, and the sight of them in the evening is enough to make any chance visitors think of spectres. All the asperities of the marble are covered with a thick bed of black or green moss. We no longer see a collection of works of art rejoicing the sight with the beauty of the form; the fingers of the hands are nearly all removed, the socles are disjointed, and are succumbing under the weights they support. The *Sanguin* of Jouvenet and the

Colérique of Houzeau (the latter recalling the visage of M. Floquet in an astonishing manner) are horrible; the *Winter* of Girardon appears to be stained with blood; the *Summer* of Hutinot—which is a figure of Ceres—is being consumed by the damp. The *America* of Guerin appears like a savage suffering under a gangrenous eruption. The *Autumn* of Regnaudin, in colour and transformation, can only be compared to one of the comic minstrels in the Jardin de Paris. The *Apollonius* of Melo, the *Shepherdess* of Granier, the *Earth* of Massou, the *Night* of Raon, the *Africa* of Cornu, the *Europe* of Mazeline are all lost, for the moss and the humidity have attacked the marble, which is being disintegrated and falls into dust. The limbs of the *Satyr* of Buyster are covered with moss and weeds.

The twenty-two groups of boys and girls, cupids, satyrs, and tritons by Legros and Lerambert, commonly known as the *Marmozets*, in the Allée d'Eau, no longer carry the attributes which gave them significance. The fine marbles of the circular *allée* before the piece of water, comprising the *Bérénice* by Lespingola, the *Faustine* by Frémery, the *Fame writing the History of Louis XIV.* by Guidi, are ruined. *Bérénice* wants a nose, *Faustine* wants a head, the remaining figures want hands or fingers. The medallions placed at the feet of the personages have lost the corners, and are broken.

The fountains of *Diana* and the *Point du Jour*, which are on each side of the approach leading to the parterre of Latona, are filled with moss and dirt. The water in the basins is darker in colour than the cocoa that is vended near it. The tone of the bronze in the fine groups surmounting the basins—*Tiger and Bear*, *Stag and Bloodhound*, by Houzeau; *Lion and Wild Boar*, *Lion and Wolf*, by Van Clève—has been transformed into a dirty yellow. The great marble vase, by Hurtrelle is wearing away through the damp, and the heads of rams surrounding it have lost their horns.

All the statues which are scattered around the parterre of Latona, one of them being the superb copy of the *Sleeping Ariadne* by Van Clève, are deteriorated to a degree that is indescribable; parts have been carried off, the figures are broken, the moss has imparted the green tone of absinthe to the marble, all the socles are tottering, and are in danger of falling. The copy of the *Nymph of the Shell*, a splendid work by Coysevox, is in a frightful state of dirt, and the parts restored at one time have the look of bandages. The *Dying Gladiator*, by Mosnier, has the aspect of a man dying of cholera; the pedestal is like an old tomb in a cemetery.

Left and right of the basin of Latona are eight beautiful vases which were made by Cornu for Colbert, a great vase by Hardy, and one by Prou. They are all broken, and fragments of the marble are becoming detached, and some day are sure to fall to the ground.

All the stages of rose and veined marble which form the fountain of Latona are disjointed; parts are carved off. The frogs which symbolise the fable of Latona and the metamorphosis of the peasants of Lycia are now of various colours. One might fancy, from their condition and attitude, that they were appealing to Jupiter for a better government. The surmounting group of *Latona* with her children Diana and Apollo, which is the splendid work of Marsy, is seriously injured. Pieces of the marble have vanished, hands are without fingers, *Latona* has no longer the look of one who demands vengeance, and her two children are so enveloped with moss and other substances that they resemble a pair of hideous dwarfs. Gaps are visible on all sides of the socle. The two smaller basins, with figures in lead, known as the *Lézards*, which are also connected with the fable of the metamorphosis, are simply ruins, and become more sad by their contrast with the beautiful parterre of flowers which surrounds them.

In the crescent facing the grass plot the important group of *Castor and Pollux*, which is signed Coysevox, and dated 1712, is mouldering under the power of damp and vegetation. The socle is broken. The group of *Laocoon and his Sons*, by Tuby, is in a worse state: the colour of the marble has disappeared through the action of the moss; the two boys have no fingers; the socle is broken and seems ready to disappear. The group by Carlier, *Papirius and his Mother*, wears a tint of yellow and black that is frightful. *Arria and Pœtus*, by Lespingola, is mutilated and the pedestal is disjointed.

All the works on the Allée du Tapis Vert and about the Fountain of Apollo are also suffering from moss and damp; the heads of the figures are no longer recognisable, in some cases feet and fingers are removed. The copy of the *Venus de Medici* by Frémery is mutilated, and the cupid which bestrode a dolphin at the feet of the figure has disappeared. The child that forms part of the group of *Hercules and Telephus* is a black monster. Here as elsewhere all sorts of words are scribbled on the figures of the goddesses. The vases are disfigured by notches or split from top to bottom. One of them has borne an advertisement of one of the Paris shops.

The twelve statues placed between the Fountain of Apollo and the canal, comprising the *Leucothœ and Bacchus*, the two *Hercules*, the *Roman Emperor* after the antique, the *Clarté* by Baldi, the *Cleopatra* by an Italian sculptor of the sixteenth century, and other work, are all disappearing under the black coating which envelopes them, and which is a bed where weeds grow. The fine group of *Apollo*, which represents the god in his chariot drawn by four horses, and surrounded by marine monsters and tritons, stands again in need of restoration. It was executed by Marsy, after a design by Lebrun.

In the groves the neglect is still more flagrant. The *Bath of Apollo*, the delightful grotto designed by Hubert Robert, is in a lamentable condition. The fissures in the masonry of the upper part, and the infiltration produced by the settlement of the slabs of the basin, have compelled the guardians to let the water run away immediately after the action of the hydraulic jet. The basin is in consequence always dry, and a field is left to the vandals, who have carried their attacks up to the foot of the central group, *Apollo Served by the Nymphs*, the masterpiece of Girardon and Regnaudin. The figures are covered with the writing of the visitors. The groups at the side of the grotto—the *Tritons Watering the Horses of Apollo*, and the *Tritons Holding the Struggling Horses*—the works of Guerin and Marsy, are worse treated, for there are cracks nearly two inches deep here and there.

The Fountain of Ceres (a work by Regnaudin), the Rond Vert, and the Bosquet de l'Etoile, are abandoned. The statuary that once adorned them is in a woful condition, the figures are mutilated, and the symbols they carried are stolen; some have fallen from their pedestals, and the fragments are buried under the soil. The Fountain of Saturn (a group by Girardon), that of Flora by Tuby, the Fountain of Bacchus by the brothers Marsy, and that of Enceladus, are only swamps where the waters stagnate; the surrounding marble being demolished, the weeds are allowed to grow to a height of more than three feet.

The Fountain of the Obelisk (sometimes known as the basin of the hundred jets) has been long left unused, the masonry is demolished as well as the marble steps of the cascades. Some of the big leaden pipes are used as if they were stepping-stones for crossing the swamp.

The vases and statues surrounding the Bassin du Miroir and the King's Garden have dents in all parts, are covered with writing, and rest on stands which are without solidity. The column of *Flora* is cracked by the moss, in the Corinthian capital birds have built their nests, the plinth is broken, and the slabs are disjointed. The two colossal statues of the *Farnese Hercules* and the *Farnese Flora*, by Cornu and Raon, have a spectral aspect; they are covered with a black deposit and parts are broken. In the grove where the famous intrigue of the Diamond Necklace had its origin, in the Salles des Marronniers, the marbles and basins alike demand urgent restoration.

The "colonnade" which Mansart designed, and for which Coysevox, Mazière, Granier, Le Hongre and Leconte prepared bas-reliefs, shows many signs of decay. The central group, the *Rape of Proserpine*, by Girardon, could hardly be more black if stained with ink, the circular pedestal and steps on which it stands are deformed, and seem about to collapse.

The grove of the Salle de Bal—the only part of the park which of late underwent a restoration—is not open to the public, and, when the depredations committed in other parts are remembered, the precaution is not unnecessary.

As to the statues which ornament the garden front of the palace, they are in a condition approaching that of the mutilated saints of Rouen Cathedral. Yet among them are notable works, such as the *Faith and Religion*, by Coustou, which surmounts the tympanum of the chapel.

The façades of the château, which have been restored since the time of Charles X., call for immediate attention. The masonry up to the balconies is covered with a damp moss that is a destructive agent; besides, it is forcing a way between the stones.

This is the state of a palace of which France was at one time so proud, and that must have cost nearly two hundred millions of livres. Of the hundreds of works of art which have been scattered over the gardens not one remains intact. If Versailles contained only Druidical monuments, the neglect might not appear to be their natural condition. But the works now being destroyed are the masterpieces of sculptors who belonged to the period that was the most artistic in France, they are not a greater age than the eighteenth or seventeenth centuries, and they have never undergone removal. A moderate amount of care would have sufficed to conserve them in all their purity of form and style. If it is no longer possible to remedy the evil which has been committed, it is at least possible to stop its advance. As soon as the Chambers meet an Act should be passed providing funds for the expensive works which have to be undertaken, and care should be taken in the selection of the artists who are to have charge of the restoration.

It is also indispensable that the materials which are used should be submitted to strict examination. Look at the condition of the château of Pierrefonds, where restoration has been

going on since the death of the regretted Viollet le Duc. In the beautiful Salle des Gardes, which is now entirely restored, the ceiling beams, which are not two years in position, are already sagging, and appear as if they would soon be unable to carry the load they are supposed to sustain. It is at once curious and painful to see the new stone in the walls at Pierrefonds falling in pieces, while the solidity of the old stone has not been disturbed after several centuries have done their worst upon it.

THE BRITISH ASSOCIATION.

THE meeting of the British Association commenced at Birmingham on Wednesday, when the President's address was delivered in the Town Hall. The following is the official programme for the remainder of the proceedings :—

Thursday, September 2.—Sectional meetings, 11 A.M. to 3 P.M. Garden parties at The Grove, Harborne (Mr. William Kenrick, M.P., and Mrs. Kenrick); Edgbaston Grove, Church Road, Edgbaston (Mr. and Mrs. G. B. Lloyd); Hallfield, Wellington Road, Edgbaston (Mrs. Nettlefold); Wyddrington, Church Road, Edgbaston (Mr. and Mrs. J. E. Wilson). Afternoon walks to Berkswell and Hampton-in-Arden, Hockley Station, Rowley Regis, and Moseley. Conversazione at Exhibition, in Bingley Hall, at 8 P.M.

Friday, September 3.—Sectional meetings, 11 A.M. to 3 P.M. Garden parties at Perry Hall (the Hon. and Mrs. A. C. G. Calthorpe); the Botanical Gardens, Westbourne Road, Edgbaston (the Committee of the Birmingham Botanical and Horticultural Society). Afternoon walks to Pouk Hill Quarry and Daw End. Afternoon visits to public elementary schools. Lecture by Professor W. Rutherford, M.D., on "The Sense of Hearing," in the Town Hall, at 8.30 P.M.

Saturday, September 4.—Sectional meetings, 11 A.M. to 1 P.M. Excursions. Lecture to working men in the Town Hall, at 7.30 P.M.

Monday, September 6.—Sectional meetings, 11 A.M. to 3 P.M. Garden parties at Chad Hill, Harborne Road, Edgbaston (Mr. and Mrs. R. L. Chance); The Dales, Augustus Road, Edgbaston (Mr. George Dixon, M.P., and the Misses Dixon); Westfield, Augustus Road, Edgbaston (Mr. and Mrs. Richard Peyton). Afternoon walks to Rowley Regis, Sutton Park, Packwood, Bromsgrove Lickey, and St. Chad's Cathedral. Afternoon visits to public elementary schools. Lecture by Mr. A. W. Rücker, M.A., F.R.S., on "Soap Bubbles," in the Town Hall, at 8.30 P.M.

Tuesday, September 7.—Sectional meetings, 11 A.M. to 3 P.M. Afternoon walks to Harborne, Sedgley Beacon and Quarries, Oscott College and Great Barr, and Walsall. Afternoon visits to public elementary schools. Conversazione in the Council House and Museum and Art Gallery, at 8 P.M.

Wednesday, September 8.—General meeting in Town Hall, at 2.30 P.M. Performance of the "Elijah" in the Town Hall, at 8 P.M.

Thursday, September 9.—Excursions.

TESSERÆ.

English Academies of Art.

JOHN PYE.

A PRIVATE academy of one kind or the other for the study of drawing appears to have existed in London from 1711. Sir Godfrey Kneller presided over the first of which mention is made. That having ceased to exist, in 1724 Sir James Thornhill established one at his own residence. Sir James died in 1734, and Hogarth having become possessed of his "neglected apparatus," established an academy in St. Peter's Court, St. Martin's Lane, at which most of the British artists of the reign of George II., and of the early part of the reign of George III., received the rudiments of their professional education. In 1740 the Foundling Hospital, then of rising celebrity, and deemed of great national importance, induced Hogarth to present to this establishment a portrait of its founder, Captain Coram. This example of liberality was soon followed by other artists. The attractiveness of this public exhibition, probably the first ever made of British works of art, demonstrated to the artists that they possessed in common the means of raising themselves from the obscurity in which they then lived, by making exhibitions of their works. In consequence a general meeting of artists was held at the Turk's Head, Gerrard Street, Soho, on November 12, 1759, when they resolved to establish an annual exhibition, to charge one shilling as the price of admission, and to appropriate the profits to raising a charitable fund for the protection of decayed artists, and a committee was appointed to carry the resolutions of the meeting into effect. The first exhibition was opened at the great room of the Society of Arts, then opposite Beaufort Buildings, in the Strand, from April 21 to May 12, 1760. But the society having objected that money could not be charged for admission to their establishment, the public were admitted gratis, and sixpence charged instead for the catalogue, of which 6,582 copies were sold; and thus was raised by British artists the first money they ever possessed in common. From the close of this exhibition the committee appointed by the general meeting to give practical effect to its resolutions appears to have shaken confidence in the community by an attempt made to divert their common property from its original purpose. A few withdrew from the many, and in the spring of 1761 the artists thus divided established two annual exhibitions. The most numerous and distinguished body exhibited in the great room in Spring Gardens, and the seceders commenced exhibiting in the room of the Society of Arts, in which the original exhibition had been made, and constituted themselves into a Society of Provident Care, supported by the revenue of exhibitions of their works, which society was enrolled in the Court of King's Bench. In 1768 the arts of painting, sculpture, and architecture were connected with the Crown by the formation of the Royal Academy, the constitution of which established an annual exhibition, and required that all candidates for the countenance of the Crown through academic honours should send their works there to be exhibited, and that they should not belong to, nor exhibit with, any other society of artists in London. In consequence the artists, with the hope of obtaining honours which were otherwise denied them, abandoned the original societies, and thus the germ of provident care and mental independence was rooted out of the national character of British artists by the acquisition, on the part of the Royal Academy, of the revenue of exhibiting the works of all the painters and sculptors of the kingdom.

Strength of Beams.

EDWIN CLARK.

In a simple rectangular beam the strength varies as $\frac{b\,d^2}{l}$; or, in other words, the strength of one beam compared with another is, first, directly as the section of fracture; secondly, directly as the depth; and, thirdly, inversely as the length. And it possesses these properties independent of the nature of its resistance, so that by direct experiment with any given beam we can determine the strength of any other beam of the same material. Experiments have been made on beams of every kind of material, and to simplify the calculation of other beams from these, the results have been reduced to those which would be obtained from beams 1 inch square and 1 inch long. Thus a beam of cast iron of these dimensions breaks with 11 tons on it (Hodgkinson); of wrought iron, 13 or 12·264 tons (Barlow); of red pine, 2·4. Knowing, then, the breaking weight of this 1-inch beam, to find the strength of any other similar beam we have simply :—(1) Multiply this breaking-weight by the sectional area of the new beam; (2) by the depth of the new beam; (3) divide this product by the length, using inches for each dimension. Taking, for example, a beam 8 feet long, 12 inches deep, 1 inch broad, we have for wrought iron,

$$\frac{\text{Constant. } 13 \times \text{Area of Section. } 12 \text{ inches} \times \text{Depth. } 12 \text{ inches}}{\text{Length, } 96 \text{ inches}} = 19{\cdot}5 \text{ tons.}$$

It is frequently more convenient to divide by the length in feet instead of inches, in which case these constants must be divided by 12, and in this form they are usually tabulated in works on the subject.

The Statues in Trafalgar Square.

ALBANY FONBLANQUE.

"My eyes!" cried an old sailor on seeing the Nelson Monument, "they've mast-headed the Admiral!" They have indeed. There he is at the mast-head like a midshipman who has incurred the captain's wrath. The mast is sufficiently represented by the column, and the capital of it is in the closest resemblance to the cross-trees. There are no shrouds, and for this good reason, that the absence of them accounts for the Admiral's having such a long spell of punishment, seeing that he cannot come down again. To stick up an admiral at the mast-head is much the same sort of thing as putting a grown gentleman into the corner with a fool's cap on his head. It may, however, be considered as a stern example of the rigour of naval discipline. The hero in the naval pillory looks very solitary, cold, and comfortless, notwithstanding all the benefit of his cocked hat. And in this last particular he comes into advantageous contrast with the king below him, George IV., who is on horseback, without a hat, and with nothing but a cloth over his shoulders. And mark here how impossible it is to please people. They complain that Nelson has a three-cornered cocked hat on. Well, here is a king riding without a hat, and they cry, "What a shame to set a king on horseback without a hat or any covering except his wig!" The horse is in an attitude of rest for two good reasons—first, that if he moved the king is sitting so that he must inevitably fall off; and, secondly, that beggars on

horseback proverbially ride to the devil, and therefore kings on horseback, who should do the very reverse in the direction of heaven, do not move at all. The king rides, as all figures with cloths instead of coats on the shoulders do, without stirrups, and looks marvellously ill at ease with his legs dangling down. In his right hand he holds a large roll of bills (marking the time when he was Prince of Wales); but it is clear that, though he has given the bridle to his horse, he is not flying from his creditors. The horse has been much criticised and found fault with as if he had been a real horse. It is asked, What sort of horse is he like? and we should answer, a clothes-horse, but for the unfortunate fact that his rider is so slightly and insufficiently apparelled. A thousand years hence, when the thing is dug up from some heap of congenial rubbish, it will be supposed to be the figure of a fat ostler with a sack over his shoulders (a covering often so worn on a rainy day), riding a horse to water. The roll in his hand will be taken for a stick broken in the attempt to beat the animal into a pace, and the bridle on the neck as denoting the rider's despair of any need of the curb with such a steed. When the Trafalgar Square monuments are complete, the mast-headed Admiral, the George the Fourth, the Charles the First, the George the Third altogether, it will be seen that the happy idea of such groupings is derived from Madame Tussaud's waxwork exhibition, where Mr. Wilberforce is grouped with Fieschi, Lord Eldon coupled with Oliver Cromwell, Mrs. Fry with Mother Brownrigg.

Early Use of Concrete.

SIR J. RENNIE.

Concrete, a mixture of gravel, sand, lime, and other cements, in certain proportions, was well known to the ancients, and in conjunction with the invaluable cement pozzolana, was applied with the greatest success in the then numerous moles and other submarine works, and its use has been still continued in Italy to the present day. Wren is said to have used it for a portion of the foundation of St. Paul's, where it was defective. Semple also alludes to it in 1776. Its use appears to have been discontinued for a time. Rennie proposed it for the foundation of the Penitentiary in 1811, Smirke and others followed in the same track, and now the employment of concrete for the foundations of buildings has become nearly universal wherever it is necessary.

Vicat's Discoveries.

F. ARAGO.

In his first essays M. Vicat made use of synthesis. Every one who had remarked how much the crystalline or molecular condition modified the physical properties of certain bodies could not give more than a limited confidence to the advantages likely to be gained by architecture from the chemical analysis of limes. The experiments of M. Vicat were directed straight to the object in view. The natural limes of Senonches were the type of perfection. M. Vicat composed an artificial lime, superior to that of the Senonches. He obtained this great result by calcinating in proper proportions chalk or pure lime mixed with clay. By this experiment light succeeded to obscurity, certainty to doubt: the art of building had received the accession of an admirable discovery. We do not suppose that the merit can be contested. It may be proved incontestably that M. Vicat was not less really the discoverer in the subject of hydraulic limes than Newton was when he published the "Theory of the Composition of White Light," or that Franklin was when he proposed lightning conductors to the civilised world. The great Smeaton vainly tried to render rich lime hydraulic by the addition of clay, without preparation. Smeaton mistaking, after repeated trials, the necessity of roasting the clay, showed, moreover, more clearly than all reasoning could do, the immense distance which separates simple appearances from realised and complete discoveries. M. Vicat occupied himself with equal success in investigating the properties of cements. Architects distinguish cements from mortars by their natural appearances. The sand contained in mortar exists there in the form of gravel more or less coarse, and more or less apparent. The composition of cement appears homogeneous, although it contains lime, silex, and alumina. No substance has gained more celebrity among builders than that known at the present day as Roman cement. This cement, called originally aquatic cement, was made in the year 1796 by Messrs. Parker and Wyatt. It was the result of subjecting to heat certain nodules of limestone of an ovoid form found in great abundance at some distance from London. Roman cement, mixed rather thick, solidifies in a few minutes either in air or water. There are certain works, the Thames Tunnel for instance, which could not have been executed without Roman cement. Under other circumstances this rapid solidification is a real obstacle, and in such cases it is necessary to substitute hydraulic lime, of which the price is much less. Parker and Wyatt manufactured their cement, and found a sale for it throughout Europe; builders used it, but no one took notice of the real cause of its singular properties. The discovery of this cause belonged incontestably to M. Vicat. We find, in fact, that after having indicated the proportion of clay which renders lime hydraulic, the skilful experimenter published in 1817 the categorical observation—"When we increase the proportion (of clay) to 33 or 40 per cent. we obtain a lime which does not slake; but it pulverises readily, and produces, when wetted and mixed up, a composition which quickly sets under water." The proportion of clay indicated is precisely that of the substance manufactured by Parker and Wyatt. M. Vicat made, then, from 1817, every kind, not only of hydraulic lime, but also of Roman cement. To render rich lime hydraulic, it is sufficient to wet it in proper proportions with pozzolana or tarras. What more simple or convenient mode could be imagined? But in many localities the expense of conveyance renders it impossible to use either pozzolana or tarras. Many attempts have been made to prepare substances which possess the same properties. Chaptal thought he had resolved the problem by very much calcinating certain schists or ochreous clay. But even supposing the properties of tarras and pozzolana to be reproduced in this manner, the difficulty was only shifted. The schists experimented on by Chaptal are not common in France; and there is, moreover, in the operation recommended, even if ochreous clay be employed, one circumstance which opposes an irremediable difficulty. It is the very high temperature requisite. M. Vicat resolved the question into its elements. This solution is as follows:—Artificial pozzolana superior, or at least equal to the best Italian pozzolana, may be obtained by a simple manner of using clay of the purest kind. This method consists in slightly calcinating the clay, in merely driving off the water of combination, and always keeping the temperature between 600 degs. and 700 degs. Centigrade (1·112 degs. to 1·282 degs. Fahr.). The mind rests with satisfaction on the solutions of problems of practical art when they possess this admirable simplicity. On the other hand, one is astonished to see an operation so easy that the workmen call it a *tour de main*, enrich a kingdom, or rather the whole world with a substance eminently useful, and which appeared as if it must inevitably remain the privileged property of a corner of the earth once the seat of volcanic eruptions.

Triumphal Arches.

J. GAILHABAUD.

The Greeks do not appear to have built any triumphal arches. All those in Greece or Asia Minor belong to the period of the Roman domination. The Romans must therefore be regarded as the inventors of these edifices, which at first were nothing more than wooden structures raised across the streets where the triumphal processions passed. These fragile and temporary constructions undoubtedly supplied the original model of the form and decoration of triumphal arches. The descriptions in ancient authors inform us that it was usual to place musicians and men bearing trophies on the top of these monuments, while the spoils of the enemy and representations of battles covered the sides. Such were the nature and object of the structure that the architect was afterwards required to produce in solid materials calculated to endure for centuries. The first permanent triumphal arches were reared under the Republic, but they had no pretensions to splendour. The Arch of Romulus was rudely built of bricks; that of Camillus of stones, almost as rough as they came from the quarry. For a long time these monuments consisted merely of a semicircular arch, surmounted by trophies and the statue of the conqueror. Such was the one which Cicero called Arcus Fabianus. Triumphal arches did not hold any honourable rank among the monuments of art until the time of the emperors; and it is a remarkable fact that, notwithstanding several were erected to Augustus, and very probably in his lifetime, Vitruvius does not even allude to them. At a later period, when a considerable number had already been erected, Pliny speaks of them as a modern invention. Down to the time of the Antonines, arches generally consisted of a single arcade; but this rule was not always adhered to, as the arch built in honour of Tiberius, Drusus, and Germanicus, on the bridge of Saintes, in the Department of the Lower Charente, had two openings of equal dimensions. This last style, though commonly and judiciously reserved by the Romans for gates of towns, was also employed in the Roman arch at Langres, in the Department of the Upper Marne, probably for the purpose of expressing the equality of the two Gordians, who both received the honours of a triumph at the same time. The use of three arcades at an earlier period is proved by medals of Domitian and Trajan, relating to arches no longer in existence; but we find instances of one principal arch, with a small one on each side, for the first time in the Arch of Orange, belonging to the early years of the empire; again under Septimius and his successors, as well as in most of those belonging to modern times. Thus we see, in accordance with the usual course of human affairs, that the richness of triumphal arches increases in an inverse ratio to the merits of the actions and men whose memory they were intended to perpetuate.

NOTES AND COMMENTS.

THE colossal statue of *Liberty* enlightening the world, by M. BARTHOLDI, which stands at the entrance to New York Harbour, was to have been inaugurated to-day. But Congress is inventive in raising causes of delay, and the ceremony is postponed until October 20. It is to be hoped there will then be an end to M. BARTHOLDI's trouble. He has gone through a veritable sea of troubles already, and he must be a staunch Republican or his loyalty would be damped long since. If there is a further postponement many people will suffer inconvenience, for the representatives of France are to embark on October 2.

IT may not be known to all English visitors to Paris, as it is not known to all residents of the city, that in addition to the Luxembourg and the Tuileries, NAPOLEON I. occupied eight buildings in the city between 1784 and 1815. He began as a military student with one of the small closets of the Ecole Militaire. In 1785 he was the occupant of a little belvidere in a house on the Quai Conti, near the Institut. It is at the corner of the Rue de Nevers. About 1790 BONAPARTE lived in a mansarde of the Hôtel de Metz, in the Rue du Mail, a shabby street near the church of Notre-Dame-des-Victoires. He is next heard of in the Rue des Fossés-Montmartre, which runs parallel with the Rue du Mail. In 1792 he was again in Paris. This time he lived at No. 19 Rue de la Michodière, which leads into the boulevard near the Opera House. The events of the French Revolution brought him to Paris as the friend of ROBESPIERRE, to be the saviour of the National Convention. On the 13th Vendémiaire he occupied a room in the Hôtel Mirabeau, in the Rue du Dauphin, facing the church of St. Roch. It was in that street he placed the cannon which mowed down the people who were on the steps of the church. BONAPARTE was, from that victory, a rising man, and a dwelling was found for him in the Rue Neuve-des-Capucines, the street between the Rue de la Paix and the Boulevard de la Madeleine. It is there where the Crédit Foncier has its offices. Under the Convention there were public offices in it. When BONAPARTE married JOSÉPHINE, she was the owner of the house No. 60 in the Rue de la Victoire, which then bore a different name. Originally the house belonged to CONDORCET; then TALMA, the actor, became owner, and he sold it to the widow of General BEAUHARNAIS. There BONAPARTE lived before and after his Italian and Egyptian campaigns, and it was his abode when he became First Consul. Afterwards he removed to the Luxembourg and finally to the Tuileries. During his consulship he held the part between the Pavilion Flora and the Pavilion Horloge. JOSÉPHINE occupied the ground floor on the garden side.

THE letter by Mr. W. H. WHITE, which appears in another column, relates to the deficiencies in the lectures which should be delivered in the Royal Academy. It is, however, an old story. About fifty years ago a return was furnished to the House of Commons showing the number of lectures given to the Academy students in the ten years between 1824 and 1833. We give a copy of that curious document:—

	1824	1825	1826	1827	1828	1829	1830	1831	1832	1833	Total	Deficient.
Anatomy .	6	6	6	6	6	6	6	6	6	6	60	none.

Painting .	6	none	4	6	6	6	6	6	none	3	43	17
											189	Total deficiency, 111.

Or by the four Academician Professors—delivered, 129, instead of 240—deficiency, 111.
* Given by substitute.

According to the original rule of the Academy, each of the five professors was expected to deliver six lectures annually. But the necessity for that mode of instruction is not so evident now as it probably was when the Academy was founded. The lectures on architecture, sculpture, and painting by Academicians, which have been printed, are little more than compilations from books that are not difficult to obtain. What is the advantage of a professor attempting the task of becoming a substitute for VASARI? In the eighteenth century there was a belief that it was necessary for an academy to show its relationship to the original one by prescribing discourses, and many of those delivered in the Royal Academy have been about as useful as the Gresham College orations. It is evident that REYNOLDS, although a fascinating talker, did not give much importance to the institution; and, according to him, the progress of the Academy rested with the visitors rather than with the professors. He says, in the most emphatic way, that art is better learned from works of art than from precepts about works of art, and he warned the students against trusting to any teacher but themselves. In the case of architecture the Academy's professional system is an absurdity. What can be taught about the art in a course of six lectures? The best of all the architectural professors was COCKERELL, but we see the value he attached to his discourses when we find that he would not publish them, nor allow more than the briefest abstracts to appear in any journal.

AFTER five years' exploration M. DIEULAFOY has succeeded in unearthing the remains of the palace of ARTAXERXES and DARIUS at Susa, and the French archæologists are anticipating many valuable additions to the Louvre collections from the excavations. The work was conducted amidst repeated attacks from brigands and fanatics, who allege that M. DIEULAFOY was violating Moslem sepulchres. The palace of ARTAXERXES appears to have been constructed on the site of the palace of DARIUS, and it is said to have some affinity with Greek work.

THE colonists who helped to create the exhibition at South Kensington have discovered, like their predecessors, the inventors and the producers of sanitary appliances, that they were put to enormous expense in order to serve other people's interests. It was supposed in Australia and Canada that the exhibition was intended to make the value of colonial products universally known. One of the Victorian commissioners, Mr. GEORGE MORRIS, is the first to express the thoughts which have been rankling in the minds of many men. He came over at his own expense, in the belief that he might advance the wine trade of Australia; but, on his arrival, he discovered that the authorities of the exhibition had disposed of the right to control that branch of industry to a firm of refreshment contractors. In consequence "one of the best opportunities that have ever been presented for bringing the wine industry prominently before the people of Great Britain has been lost." We are told that "the exhibition has entirely failed in one of its principal objects." Of course it has, for the promotion of colonial trade was not the purpose of the exhibition. It is very possible that we shall soon hear many other expressions of disappointed hopes. The colonials need not fear to say they were bamboozled, which is the conviction among the majority of exhibitors in the preceding exhibitions, although they consider it is more prudent to be silent on the subject, and to console themselves with reflecting on the number of distinctions which they were able to acquire for gentlemen who were not exhibitors.

WE are not always able to approve of the change of names in Paris streets, for they involve the loss of many historical and romantic associations. To the latest alteration there will not be much opposition. One of the last acts of M. GRÉVY before he departed on his holiday excursion was to approve of the decree of the Prefect of the Seine by which the Rue de Boulogne becomes henceforth the Rue Ballu. This is intended as an honour to the memory of the architect, one of whose latest works was the new Hôtel de Ville. The Rue Ballu is near the Boulevard Clichy, and not far from the Church La Trinité, which was designed by M. BALLU. It is a small street, and several artists reside in it. In 1836 several Roman works were discovered there. A bust of M. BALLU is in the Hôtel de Ville. He lived in the Rue Blanche, from which the Rue Boulogne or Ballu leads; but we suppose there were reasons against altering the name of that street, and its neighbour was substituted.

ILLUSTRATIONS.

BAROMETER AND THERMOMETER IN BOXWOOD.

WHILE *L'Art* gives etchings by the first artists of England and France from the masterpieces of painting and sculpture, it is not oblivious of industrial art. The etching which we give this week is an example of the care that is taken to illustrate works of that class. In this case it is difficult to draw the line between high and industrial art, for the philosophical instrument by M. BEURDELEY is so perfect in design that sculptors might claim it.

ARCHITECTURAL ILLUSTRATION SOCIETY.

NO. 21. WEST ELEVATION OF CHURCH IN GORDON SQUARE.

DRAWING-ROOM, HAMSTEAD, STAFFORDSHIRE.

THIS room has the whole of the internal woodwork of polished oak, the whole of the columns being of polished Devonshire marbles. The lead lights have been supplied by Messrs. R. W. WINFIELD & Co., and the gas-fittings by Messrs. BEST & LLOYD. The remaining work has been executed by Mr. WILLIAM BLOORE, from the designs and under the superintendence of Mr. JOHN P. OSBORNE, architect, Birmingham.

JAPANESE LEATHER PAPER (SEVILLE PATTERN).

THE material this represents is a leather paper manufactured in Yokohama, Japan, and imported by Messrs. A. SANDERSON & SON, of 52 Berners Street, London, W. It is a departure from the old Japanese paper both in style and quality; the emboss is far deeper than anything that has been used before, and all the raised parts are filled at the back, thus forming a solid raised material that has all the soft and artistic effect of real leather, which is, unfortunately, so entirely lost in most solid raised decorations. The treatment is also quite new, being an imitation of carved ivory, the effect of which is very fine and has been greatly admired. This pattern is also made, in imitation of the old leather, in gold and in crimson and gold, &c. We might mention here that the gold in these parts is imperishable, and will withstand damp and gas. The pattern we illustrate is a reproduction of an old and very famous Spanish leather which is known as the Seville pattern, and in this material it has the advantage of the Japanese fine work and high finish without losing the artistic design and feeling of the best Spanish work.

THE FOUNDATIONS OF VENICE.

THROUGH the kindness of Signor Boni, one of the architects of the Ducal Palace, I have been examining, says a correspondent of the *Times*, the data gathered by him and his colleagues as to the methods of the builders of Venice in preparing the foundations of their structures, data which furnish information of interest to those who love the city of the lagoons.

Signor Boni's examination of the cylinders drawn up from the artesian borings shows that the subsoil of Venice for at least 200 mètres is an alternation of clay, sea-sand, mud, and carbonaceous matter, showing that for ages before Venice existed its site was exposed at long intervals to the action of rivers, to the sun, and then to the sea, no fewer than ten different strata showing the evidences of as many periods of exposure to the sun, having been covered by vegetation, and then re-immersed, the sea coming and receding, followed by the floods from the mountains again. The present period of exposure has been a much longer one than has generally been imagined, for Cavalier Battaglini, the zealous custodian of the museum of Sorallo, has found in his excavations on the island vases of early Italic type, with others Etruscan, and many of the early Imperial epoch, so that when the people of Altinum fled before Attila, they took refuge in well-known and inhabitable localities, though sea-built isles.

When, therefore, it was intended to place the foundations of a mass of masonry like the palaces of the twelfth to fifteenth centuries or the huge piles of the campaniles, the practice was to excavate the unstable soil and *débris* of depositions, the constructions and demolitions of centuries previous, until solid clay was reached, rock being out of question at any depth. The first layer of clay being reached, piles were, when great stability was needed, driven in and down to and through the next stratum of firmer and more resisting clay into the stratum of sand beneath. These piles, first driven in a hollow square, were then driven within it until the square was filled as close as piles could be driven, and the interstices with fragments of stone rammed in. On this a raft of oak planks several inches thick was laid crossing in double layer, and on this were deposited masses of squared stone up to the wall bases. This wood, laid in the fourteenth century, is still found in perfect preservation. This, at least, was the process followed in the construction of the campanile of St. Mark's, the foundations of which were recently laid bare by Signor Boni, and the surprising fact was learnt that this foundation, bearing the greatest weight per superficial inch of any substructure in the world, only widens about two mètres on fifteen square at the pavement from the base of the campanile to the *palafitta*, as the mass of piles is called, a depth of five mètres. And this is the most solid foundation yet explored. That of the Ducal Palace lacks the *palafitta*, the stones of the substructure, 2·88 mètres deep, being laid directly on the first stratum of clay, and this in the structures of the various periods; that of St. Mark's has a *palafitta* only 2 10 mètres deep. The foundations of the church of the eleventh century show better work and better materials than the later constructions, the marble shell which was added a century later having only a semblance of foundation, even less than was the case with the pavilions of the south-west and north-west angles already described. This *palafitta*, where it exists, does not go down to that deep stratum of clay of great firmness on which the campanile rests, and therefore is more liable to subsequent and unequal subsidence, the stratum of clay on which the *palafitta* rests being unequal in thickness as well as compactness.

Now, as we do not know how far the general subsidence or elevation of the surface of the island has gone since the date of these constructions, it is impossible to determine exactly what may be the subsidence of the structures; but we have in St. Mark's an inequality between portions that must have been on a level once of nearly or quite a quarter of a mètre in the width of the portico. The campanile must have subsided as a whole, for the weight of the mass, calculated at nearly 20,000 tons, could not fail to make an impression on the stratum of clay already entirely traversed by the *palafitta*, the points of which enter into the sand beneath it, and it has certainly not failed to produce the partial subsidence which is found more or less in all Venetian buildings, the north side of the campanile having reached the perpendicular from the gradual greater subsidence of the foundation on that side, and the old pavement of the square is found at 72 centimètres below the present. A similar difference is found in the Ducal Palace, where were in the original construction three steps leading from the piazza up to the floor of the arcade, now on the same level. But this difference is difficult to apportion, as we have no data from which to prove the original elevation above the general surface of the island. What is clear is that the site of the Ducal Palace was much more trustworthy and equal than that of St. Mark's, as the permeability of the latter is still very great, the rise and fall of the tide being visible in that portion of the first church which lies under the great dome, as may be seen through the little window in the enclosed portion of it. The Ducal Palace, if sinking, is sinking solidly and equally, and though by its construction necessitating ties and braces of iron, does not show any serious cracks such as appear in St. Mark's, which, considering the slight difference in the substructures of the two buildings, can only be due to the fact that the palace was built on a natural ridge and the church on a more or less artificially formed soil.

This partial subsidence is the cause of the precarious state of St. Mark's, and, were the means forthcoming, would justify a far more radical statical restoration than anything hitherto attempted. This subsidence, besides the fracturing of the walls and general injury caused to mosaics and marbles of the facing, is, as I before said, destroying the pavement, and the committee of the English Society for the Preservation of Ancient Monuments, in the protest to which I have alluded, adduces the fantastic theory that the pavement was originally made undulating to show that St. Mark ruled the waves. It ought to suffice to study with even slight care the pavement itself to recognise the absurdity of this idea. In the first place, the position of the piers beneath is tolerably well indicated by the thrusting upward of the pavement, and then it will appear clearly, if one will examine the splendid slabs of Greek marble which cover a great part of the pavement of the nave, of which those under the nave, about 12 feet by 5 feet, are all sawn from one block, and were clearly intended to preserve their plane surface, but are now cracked, or in some cases badly broken over the resisting points of the substructure, the number of the fragments varying from half a dozen to three dozen, all, however, being broken. Of this the just issued annual report for this year says:—"In the interior of the church one of the most urgent works is the reconstruction of that large portion of the

pavement which lies under the central cupola, and this on account of the unequal subsidence (*avvalamento*, valleying) which seems to be increasing, and which causes numerous and dangerous falls." This portion of the church is that before the pulpit of the Patriarch, and the present state of it is a positive danger to his audience, which certainly was not the intention of builders of St. Mark's. I am glad to see that the report recognises the necessity in the future of the complete restoration of the pavement, some of the most interesting designs in which are already destroyed beyond recovery by wear, though for the present these plans are simply recommendations for consideration of the Government of Rome, which, on the recommendation of the Commission for the Preservation of Ancient Monuments, decides what part of the suggested works shall be carried out. And since I am on this subject I will, for the information of your readers as to the effects of the subsidence spoken of, quote a single sentence from Dr. Saccardo's report of the restoration of the ancient chapel of St. Isidoro, "the roof showed, still open, the crevices produced by ancient movements of who knows how many centuries, movements so great and grave that the head of one of the figures in the mosaic was removed a good palm from the body."

Of course much of this insufficiency of the foundations of St. Mark's is due to the facts that the church was not in its beginnings calculated for the scale which it has reached, and that work of the eighth century, which was for its then uses sufficient, became by the later additions buried beyond reach and reinforcement of the architects of the twelfth century, during the interval between which periods it was in progress. The basilica had four centuries of construction, four of embellishment—it is approaching its fourth of nursing and more or less intelligent restoration—in all a history unique in the existence of architecture.

THE ROYAL ACADEMY AND ARCHITECTURE.

THE following letter from Mr. W. H. White appeared in the *Times* on Monday :—

Sir,—To those who, like myself, believe that George III. established the Royal Academy "for the purposes of the arts of painting, sculpture, and architecture," the correspondence you have recently published on the subject is peculiarly painful. It would seem, from the letters of both Academicians and outsiders, that the country recognises only one artistic profession—namely, painting—and that a speculative annual exhibition is, if not the sole, at least the primary object of an English Academy of Arts. Moreover, it would seem that this Georgian institution is still so perfect as to merely require the better regulation of the number of pictures which each exhibitor should hang periodically within its walls; and I have patiently waited in the hope that some painter would write to remind his colleagues in what the true functions of a Royal Academy consist—that beyond the narrow limits of these isles an Academy of the Fine Arts is not simply an open market for the exposition of pictures, or even a fashionable emporium for their sale. But no one has yet ventured to do so. On the contrary, a triumphant majority of Academicians, through their spokesman, "R.A.," has gratuitously flung a gauntlet of defiance at all those who, besides painters, practise the arts of design, such as sculpture, architecture, engraving, drawing, for the cultivation of which, according to the instrument of foundation, the Royal Academy was established. "R.A.," admitting that the institution was founded for public objects defined in that instrument, fearlessly claims judgment upon the stewardship of its trust, which trust, he adds, "has to be tested by the objects thus defined." So, with your permission, sir, I will attempt to prove that, as far as concerns architecture, the Royal Academy has not fulfilled some of the crucial obligations imposed upon it by royal mandate.

Clause XI. of that instrument decrees :—"There shall be a professor of architecture, who shall read annually six public lectures calculated to form the taste of the students, to instruct them in the laws and principles of composition, to point out to them the beauties or faults of celebrated productions, to fit them for an unprejudiced study of books, and for a critical examination of structures;" and under another clause this professor is to be elected from among the Academicians. But there is not, and there has not been for at least a quarter of a century, any study of architectural composition in the Academy schools; for years there has not been any serious study of planning there, such as the Continental schools deem absolutely essential to the teaching of architecture. Mr. Street was the last professor, and as, since his death in 1881, no Academician has been found willing or fit to carry out this part of the trust, the Academy Chair of Architecture has remained vacant for five successive years.

Clause XIII. decrees :—"There shall be a professor of perspective and geometry, who shall read six public lectures annually in the schools, in which all the useful proportions of geometry, together with the principle of linear and aerial perspective, and also the projection of shadows, reflections, and refractions, shall be clearly and fully illustrated;" and under another clause this professor is to be elected from among the Academicians. But there is not, and for 26 years there has not been found one Academician willing or fit to perform this part of the trust—a part which in the higher schools of the Continent is regarded as vital to the teaching, not alone of architecture, but of all the arts of design.

Clause XX decrees :—"There shall be a library of books of architecture, sculpture, painting, and all the sciences relating thereto." But how many books of the last-named category can be found there? I ask this because, though the Royal Academy makes a vast pretence of teaching architecture, it has not and never has had a professor of construction. Indeed, when, two or three years ago, looking at the students' drawings at Burlington House, I perceived that the architectural design to which the highest prize had been awarded could not possibly hold together—that it would fall like a house of cards on a rickety table—I was gravely informed that the Academy gold medal for architecture is given for "design" not "construction." From that moment I have ceased to wonder at the many unkind things which have been printed about modern architects in the *Times*, for how can it be otherwise when in their very nursery they are encouraged to be unkind to themselves?

A statement of "R.A." also demands inquiry. If, as he says (August 14, 1886), the Academy schools since their foundation have given to the country most of its chief artists, at a cost of several thousands of pounds annually, how comes it that so few of the Academicians and Associates have entered as students therein? The architects alone concern me, and, since the foundation in 1769, there have been twenty-eight architects admitted to membership of the Royal Academy. Of these, ten were received as students, only six of whom obtained honours in the schools. Of the architects elected during the present century, neither Wyatville nor Wilkins, neither Cockerell, Barry, Scott, Burges, nor Street (all now deceased), neither Mr. Pearson, Mr. Waterhouse, nor Mr. Bodley were students of the Royal Academy. It is utterly misleading for "R.A." to claim such recognition by the country, and, as for the annual cost of the schools, how much of that cost goes to the Academicians themselves? It would be instructive to know the total annual amount of "the emoluments of the Institution," which, in compliance with King George's gracious intention (Clause XXIII. of the instrument of foundation), are to be divided as nearly as possible among all the members. In other art corporations, one or two, or perhaps more, of the executive officers, who give all or most of their time to the Institution, are paid; the general body of members join in the common work without pecuniary reward, after business hours and at their leisure. But each member of the Royal Academy receives a fee for his attendance, and every kind of work done there by Academicians is paid for in hard cash; besides which, every officer, from the president downwards, receives an annual salary, and all this over and above the comparatively large incomes assured to them by their position alone from public and private patronage.

"R.A." maintains that the Royal Academy was founded by King George III. "upon property which was his own." Observe how history grows by time and repetition. As far as I can learn, the King, after starting "his exhibition," gave the Royal Academy at different times 5,000*l.* out of his privy purse, and in 1771 ordered certain apartments in his old palace of Somerset House to be appropriated to its use. When this was pulled down and the present building erected for Government offices at the public cost, the King ordered a few rooms in the new building to be reserved for the use of the Royal Academy. Later on it was permitted to occupy half of the new building intended for the National Gallery in Trafalgar Square, the national collection of pictures being then comparatively small, and ultimately a part of Old Burlington House was presented to the Royal Academy at the cost of the taxpayers. It is this last gift which, in the words of "R.A.," has removed from the nation "the lien of the King's gift to the Academy." The gift is now regarded as the mere fulfilment of a pledge or as an outstanding debt at last happily paid. But when Parliament was voting supplies for the purchase of Old Burlington House, you, sir, did not regard the matter in such a light. The *Times* then wrote :—"It is not 70,000*l.* that we are asked to give the Academicians, but absolute and despotic control over British art;" and you added, "Is this right?" Sir, the events of the subsequent twenty-seven years have shown that it was not right. It was not just to deliver over the sculptors, architects, engravers, and draughtsmen of the country to the mercy of an exclusive majority of painters. At the present hour the representation of the arts of design at the Royal Academy is divided among seventy-three privileged persons (Academicians and Associates), of whom fifty-nine are painters, seven are sculptors, five are architects, and two are engravers. Such a proportion is not only not equitable, it does not constitute even an efficient

representation of the "arts of design," which are the words used in the instrument of foundation.

When, two years ago, I set myself to compare, from an architectural standpoint, the relations of School, Academy, and State in Paris and in London, I was amazed to find how complete and national is the French academic system; how hollow and personal is the English one. In France the Académie des Beaux-Arts (Institut de France) is a recognised tribunal of world-wide fame. It consists of fourteen painters, eight sculptors, eight architects, six engravers, and four musical composers, in all forty distinguished experts, always maintained at the same strength and in the same proportion. If an epidemic were to carry off the sixteen sculptors and architects of that Academy, sixteen others almost similarly accomplished would be forthcoming at once. But, awful reflection! if our four sculptor Academicians and our three architect Academicians were to be suddenly taken from us at one fell swoop, would their surviving brethren seek abroad for foreigners to fill the void, as John Bull sometimes does when he wants a sculptor? or would they advertise in the public prints for latent genius of the native sort, as the Government of this country does when it wants an architect? I have, however, no wish to appear funny or smart, for, thanks chiefly to the Royal Academy, architects have been left very little wherewith to make merry in this teeming corner of an overbuilt part of the world.

It has not been my intention to describe how the arts of design other than those purely architectural have suffered at the hands of the Academicians, but I ask leave to state that the Academy chair of sculpture, last filled by Mr. Woolner, R.A., has remained vacant for six successive years.

Mr. G. Aitchison, A.R.A., in reply to the foregoing, says:—

Mr. W. H. White, in his letter that appeared on the 30th inst., quotes from clause 11 of the instrument of foundation of the Royal Academy, which decrees that "there shall be a professor of architecture, who shall read annually six public lectures," and subsequently states that "the Academy chair of architecture has remained vacant for five successive years."

This latter statement is correct, but the council has not allowed this vacancy to wholly deprive the architectural students of their lectures, for lectures on architecture were delivered in 1882-3-4-5-6, and I know that the following gentlemen were employed for the purpose, viz.:—F. Penrose, M.A., Stanley Lane Poole, B.A., A. Waterhouse, R.A., G. F. Bodley, A.R.A., and myself.

Mr. White is also ambiguous when he says, "But there is not, and there has not been for at least a quarter of a century, any study of architectural composition in the Academy schools; for years there has not been any serious study of planning there, such as the Continental schools deem absolutely essential to the teaching of architecture." Mr. R. Phené Spiers, the master of the architectural schools, is not only an accomplished architect and water-colour painter, but he went through the course of the Ecole des Beaux-Arts at Paris. The architectural R.A.'s and A.R.A.'s serve in turn as visitors in the school, and every six weeks a subject to be illustrated by plan, elevation, section, and details is given out, drawn out by the students, and exhibited, when prizes are awarded for the best.

SWYNNERTON CHURCH.

THE members of the North Staffordshire Field Club lately visited the neighbourhood of Swynnerton. Mr. Charles Lynam, architect, supplied a description of the parish church. He informed the members that his first visit to the building was made as far back as 1850, when it was in an unrestored state, at which time, he said, it possessed an interest absent in its present more perfect condition. Its hoary age was then its prevailing characteristic, and it begot in one that strong sympathy which the upright wall and the newly-wrought stones never seem to command. Of the details which still retained their ancient character, attention was first directed to the beautiful Norman doorway in the east wall of the tower. Its western face was exceptionally fine both in its general design and in the elaboration of its details. It was of very rare occurrence, if not unique, he pointed out, to find an inner doorway of a tower treated with enrichment such as was to be seen here. Indeed, a second door at all to a tower was uncommon, and its existence here gave rise to the supposition that originally this was an external western doorway to the nave, and this suggestion involved the question whether the internal doorway was not of older date than the lower stage of the tower. Its bold details and the character of the carvings certainly pointed in that direction, whilst the work of the tower itself, with its spreading base weatherings and the slight remains of the original external doorway, showed later characteristics. Having pointed out other points respecting the tower and the principal features about the body of the church, Mr. Lynam dwelt at some length on what was interesting in connection with the chapel on the south side of the chancel. It was known as "The Lady Chapel," but he thought that in all probability it was erected as a mortuary chapel. It now contained two relics of interest, one the alabaster slab against the east wall, and the other the colossal seated figure of our Lord against the west wall. The figure was found, the rector informed him, beneath the floor of the chapel, on an occasion when the family vault had to be opened. Opinions differed as to the date of the sculpture. Some placed it as far back as the original church, and assigned to it a date as early as the twelfth century. Any master of Mediæval sculpture, however, should be able to fix the date with certainty. Having regard to the form of the seat occupied, and to what can be made out of its mouldings, his opinion inclined to a later rather than an earlier date. What its purpose was remained a further puzzle; it had been suggested that it was brought from Lichfield Cathedral, but that view the present rector discarded. It was certainly difficult to conceive its being in proportion to any part of the church which now contained it. From within the chapel might be seen a low window, commonly known as a "leper window," where, it was supposed, persons afflicted with disease came to receive the rites of the Church without coming in contact with the congregation. The original windows of the chancel were of an interesting character, from the fact that they pointed to the date immediately previous to the introduction of tracery—about 1245. Of the recumbent effigy in the south of the chancel, Mr. Lynam said it was a stately figure, and probably represented the founder, not of the original church, but of its rebuilding in the thirteenth century. It used to be considered that cross-legged figures (the right leg of this effigy being crossed over the left) were either Crusaders or were pledged in some way in reference to the same. The latest authorities now declaimed against this theory, and the last assumption he was aware of was to the effect that this position of the body was chosen as best representing that of complete repose, aiming at an expression of the idea of Sir Walter Scott—

> Soldier rest, thy warfare o'er,
> Sleep the sleep that knows no breaking,
> Dream of battlefields no more,
> Days of danger, nights of waking.

THE BUCCLEUCH ESTATE, RICHMOND.

THE Richmond Vestry having made application to the Local Government Board for powers to borrow 30,000*l.* in order to purchase the Buccleuch estate, containing twelve acres, and which adjoins a field already owned by the town, an inquiry into the subject was held before Mr. Harrison, C.E., on last Friday and Saturday. Mr. Michael, Q.C., represented the applicants, and Mr. Burt the opponents.

Mr. Michael said the population of the town was estimated to be 22,000, and the valuation for taxation was 169,349*l.* At present there were unpaid loans amounting to 91,594*l.* To that sum must be added the probable expenditure hereafter on main drainage, which might amount to 100,000*l.* But the total sum would not much exceed one year's valuation. Counsel then explained how the Duke of Buccleuch, having put his property into the market, had agreed to dispose of it to the Vestry for 30,000*l.* If it were purchased, and a light iron rail substituted for the existing wall, the finest walk in Europe would be secured. The Vestry had received offers amounting to 15,000*l.* for a part of the land; there was no reason why Richmond should be injured when a rate of three-halfpence in the pound would save it. If the estate fell into the hands of speculative builders, the property in the town would become deteriorated in value and inhabitants would be driven away. He calculated the rate in this way. The interest on the 15,000*l.* would amount to 600*l.*, the expense might be taken at 300*l.*, or in all say 917*l.* At present a penny rate produced 625*l.*, so that one of three-halfpence would be sufficient.

The first witness called was Sir Frederick Leighton, P.R.A. The President said he was very well acquainted with the view from Richmond Hill, and it was one of his greatest solaces after a weary day's work. He should contemplate any building on the Buccleuch Estate with horror and dismay. It would be the greatest public disadvantage. "I don't know the peculiar circumstances of property in Richmond, but," continued the President, "I feel in regard to that view that it is a view which is famous all the world over, which is enshrined in our literature and art, and Englishmen all over the globe are proud of it. People come from the Antipodes to see it. It is the property of all of us as it is our pride, and I venture to think, with all deference to the opposition, that it is in some sense the life-blood of Richmond. I do not speak of the gain that its acquisition would be to Richmond. I have only just visited the spot, and I cannot trust myself to speak of the extraordinary gain to the resources and beauty of Richmond that this would be, not only for the population of Richmond, but for every artist in the country, and if I am not out of order I should like to express at this moment the deep sense of gratitude of every

artist in the country to the Vestry of Richmond for their most patriotic action."

Sir J. Whittaker Ellis, M.P., said he agreed with Sir Frederick Leighton as to the scenic value of the estate. In a picture foreground was wanted as well as background. With many artists it was everything; in this case, if the foreground was removed the picture was gone. There was very little to be done except removing the wall and putting up some light fences, and from his experience in his own gardens he thought 250*l.* was an ample allowance for keeping up the grounds. If houses were built on the grounds they would decidedly affect the value of the property on the hill, owing to the smoke being driven upwards by the mist of the river. When asked if the view could be improved by removing some of the trees, Sir J. Whittaker Ellis said the work must be done carefully, because trees live and grow together—if one is destroyed its neighbour is likely to be destroyed. Hence if houses were built and drains made, it would be necessary to remove some trees, and the others would be sure to die.

The Inspector said he remembered hearing the late General Scott say that the effect of the drainage of the Albert Hall was the killing of several of the elms in Hyde Park. Evidence was also given by Mr. Driver, Mr. Ryde, Mr. Clutton, and Mr. Chancellor in support of the application.

Mr. Vicat Cole attended on Friday, but could not wait. In a letter on the subject he wrote:—"I could only have said in answer to any questions the Inspector might have put to me, that I, as an artist, do sincerely hope the purchase of the estate will be effected by the Vestry. It is the loveliest spot in all England. Driving through miles of crowded noisy streets one finds another world suddenly opened—one of exquisite beauty in form and colour, with the silver Thames gliding through it, and, above all, one of unspeakable repose. This I feel sure would be quite lost if the building speculator had his way. The effects of covering a part of the hill with buildings, and their accompanying smoke, or turning the estate into Cremorne Gardens with brass bands and fireworks, would be to utterly destroy the greatest charm of Richmond Hill. The situation of the estate is of inestimable value to the view. I remember when, some years ago, trying to paint the scene how important those trees on the right were to it, and how impoverished it would have been without them. I feel that the cutting up of this estate would be ruinous to Richmond and disgraceful to the country. I am thankful that Sir Frederick Leighton will be present at the meeting with his artistic knowledge and eloquence."

On Saturday the case of the opponents was heard, the contention being that the Vestry could not gain support in the town for the application, and had to depend on witnesses who did not reside in Richmond. In reply to a question from the Inspector, Mr. Michael, Q.C., said that if the Vestry only required the sum of 15,000*l.*, in consequence of the resale of a portion of the property not required for the public enjoyment, he assumed there would be no difficulty in amending the application, and that the Local Government Board would sanction the loan of 15,000*l.* only.

THE ARCHÆOLOGY OF THE SWANSEA DISTRICT.

THE Cambrian Archæological Society visited Swansea and its district last week. The president of the meeting was Mr. J. T. D. Llewelyn, who in his address said:—

The antiquities of Swansea have already received your attention at a previous meeting in the year 1861, but for two reasons another meeting on an already reconnoitred locality may be held with advantage. In the first place, a new generation will have sprung up after an interval of twenty-five years, to whom this meeting will come fresh and full of interest; and secondly, the information acquired by those who were here in 1861 will not only bear refreshing, but very possibly be the germ from which more matured opinion and views will have been developed, and if such find expression in the debates and transactions of the "Archæologia Cambrensis," it will be to the advantage and benefit of the history which it is our special point and object to clear up and emphasise for those who come after us. Truly it is for this that the Cambrian Archæological Association exists. The remains of past generations rapidly become obliterated by the ravages of time, weather, and careless and destructive man. We cannot well avoid the former, but it should be our constant watch and care to prevent the latter, and in such a cause every member of our association can act as though he were a member of a vigilance society, to prevent any Vandalism which he may observe, to secure that any excavation, disinterment of remains, such as opening a tumulus, barrow, or cairn, or laying bare a Roman tesselated pavement, shall not be carelessly done, or left to inexperienced workmen, but if carried out at all, be well superintended, and an accurate and reliable report prepared for the next meetin of our association. Remains do exist in our district, and it would be a lamentable loss if their destruction should be wanton or careless, and the histories on which they might shed invaluable light be left in the Cimmerian gloom which we, as an institution, exist to brighten. The district around Swansea abounds with material for reflection on the past, and interest for the archæologist. Whether it be in the Cymric, Roman, Norman, or Mediæval periods, remains exist in pre-historic cairns and encampments, giving a dim evidence of the rude quarrels and resistance to the intrusions of unwelcome invaders of the old land of their fathers, in the cromlechs and Druidic remains which testify to the earliest forms of their primitive worship; or whether we come down to the Roman period, when the evidences point to the probabilities that their roads and stations (which are still to be traced both by their names and their actual visible remains) were not destined to bring about that civilisation and colonial success which attended their engineering efforts in richer and more accessible parts of Great Britain, probably both on account of the distance and the poverty of the district, and of the resistance of the rude Welsh tribes, we find a scarcity of these remnants of the luxury which attended these settlers in other places. Villas with their tesselated pavements, baths, and other evidences of luxurious ease and rest are scarce here, while the names of castell and caer, one of Roman, the other of Cymric origin, are as suggestive in their opposition as the positions of the camps of these rival nations. Names and legends may, if taken alone, be of little real value, but they are suggestive to many.

The most interesting of the visits were those to Margam and Neath Abbeys. Mr. S. C. Gamwell read a paper on Margam Abbey. He said the conquering Robert Fitzhamon died in 1107, Lord of Glamorgan as well as Earl of Gloucester. He left but one child, a daughter, Mabel, who was, of course, a great heiress. It is on record in verse that King Henry sought her hand in marriage for his illegitimate son. The lady, knowing her own worth, asked what name the suitor should bear. The King replied that he should be called Robert Fitzleroy, and should be created Earl of Gloucester and Lord of Glamorgan. This settled the matter; the marriage took place, and this bold and powerful noble, who was known as Robert the Consul, founded Margam Abbey in 1147, the last year of his life. His body was buried at Bristol, which was the head of the honour of Gloucester. The abbey was dedicated to St. Mary, and its name was variously written Morgan, Margan, and Margam in that happy time when as yet there were no school boards and no plucking for unorthodox spelling. Margam Abbey existed for four hundred years, a period as long as, and probably involving nearly as many political and social changes, as have passed between our own day and the accession to the English throne of Henry VII., the first of the Tudors; and during these four centuries it no doubt passed through many vicissitudes, the history of which is now irrevocably lost, if it was ever written. Leland says the abbey possessed the right of sanctuary, a rare privilege granted by the Normans to their inveterate foes in Wales. But Margam's abbots appear to have held the balance fairly, and to have done much to soften, by the sanctions and prohibitions of religion, the painful condition of things subsisting between the invaders and the invaded. Margam was one of the 1,000 religious houses which Henry VIII. suppressed, and probably some of its revenues went into the general fund of 160,000*l.*, equal to about 1,500,000*l.* of our money, out of which the King founded six new bishoprics, several colleges, schools, and hospitals, repaired Dover Castle and other national defences, and pensioned a few monks and many favourites. There were many applicants for the lands of the abbey, notably St. John, ancestor of the Fonmon family; Carne, ancestor of the St. Donatt's family, and one Gunter, who was a farmer of abbey lands. These negotiations terminated in 1564 by the sale of Margam Abbey and its demesne to Sir Rice Mansel, of Oxwich Castle, Gower, for 678*l.* 1*s.* 6*d.* It was granted to him in fee, subject to a gross rental of 4*l.* 4*s.* 11½*d.* This document, with a great seal in white wax, is still at Margam.

Mr. T. S. Sutton, in his paper on Neath Abbey, dwelt mainly with the supposed original plan of the abbey. The story, he said, of the dilapidation of the abbey had still to be written, because time alone would not account for the devastations now seen. Some portions of the building had fallen within the past thirty years, probably through the vibrations of the trains which passed on the adjacent railway. There were, however, still standing many indications of what the abbey was before—a grand west window, a lofty nave, pillared aisles, handsome transepts, a rood screen, &c., the whole dominated by a square tower. Then there were traces of the domestic buildings, whose object was the dispension of hospitality, besides a small building which had the aspect of a porter's lodge. This last-named building, in comparatively recent time, had been utilised for the refining of ores, the chimneys being used as furnace stacks. As to its extent, there were buildings in the neighbourhood which showed that it must have been great, and had extensive dependencies.

THE PRESERVATION OF OUR ABBEYS.

IN a letter addressed to the *Times*, the Rev. Precentor Venables writes :—

The condition of Stonehenge—its constant exposure to mutilation and the apprehensions for its stability—has brought the preservation of our ancient monuments, which are among the most priceless treasures of our land, prominently before the public. Among these monuments of the past few are dearer to Englishmen, whether home-born or children of the Greater England beyond the sea, than our ancient abbeys, and yet none are in greater danger of being gradually lost to us. It is not generally recognised that a ruin, by the very fact of its being a ruin, deprived of the usual protection of roofs and eaves and the like, requires not less but more care than a perfect building to preserve it from further decay. Those who have watched our ancient buildings know well that even when they are carefully looked after no winter passes without loss of some kind to the fabric, while, where no attempt is made to secure their stability, their gradual destruction is certain, and is only a question of time.

May I then be allowed to employ your columns in urging on the proprietors of all ruined abbeys, and I may add castles, to take timely measures for their preservation, and to continue these measures year by year as circumstances require? I would not be supposed to be advocating anything in the way of so-called "restoration," which too usually means substituting a lifeless copy for the outcome of the genius of the original builder—a man who loved his work and threw his heart into what he did; still less any wholesale destruction of old work and replacing it by Brummagem nineteenth-century finery because the old is worn and homely and failing, such as every true antiquary has to lament at St. Albans. What I would urge is simply the removal of all causes of injury, such as ivy and trees and shrubs (which, however much they may add to the picturesqueness of a building, are the most fatal enemies to its stability); the erection of buttresses to keep up tottering walls, taking care that the additions show their date and character on their face; the supply of fresh masonry here and there, where for want of it a pier or an arch or a window is nodding to a fall; and, above all, the careful cementing of the tops of the walls to prevent the penetration of moisture. It may also be necessary sometimes to add iron bars, however ugly in themselves, to bind together tottering pillars and walls, as has been done with such excellent results by the Duke of Devonshire at Furness Abbey, and save them from a ruinous collapse.

It is needless to say that such work is costly work. A ruined abbey is something of a *damnosa hæreditas*. But if those who inherit these monuments of the past regard themselves as they really are, not in the light of owners who may do what they will with their own, but simply as trustees of a portion of our national heritage, they will be far from grudging the expenditure necessary to enable them to hand down their inheritance unimpaired to future generations.

This letter has been called forth by a recent visit to two of our most celebrated abbeys, both Cistercian, Valle Crucis and Rievaulx. I can remember both covered with the deadly Nessus robe of ivy, with trees and creepers growing from the walls, and slowly but most surely disintegrating the masonry—lovely, but fast sinking to decay. Now, in defiance of the outcry of the amateurs of the picturesque, the whole buildings have been disencumbered of this fatal beauty, the yawning fissures have been closed, and a coating of cement has rendered the summit of the walls impervious to moisture. The one is a work of several years back, due to the late Lord Dungannon and Mr. Wynne, of Peniarth. The other was only completed last year by Lord Feversham. When I visited Rievaulx last August the lovely choir was invested with a scaffolding, and was busy with workmen, under efficient superintendence, staying the progress of decay. Last Thursday I found the work finished, and rejoiced that so good a work was done. In one respect, however, the work at Rievaulx contrasts unfavourably with that done at Valle Crucis, as well as that at Fountains, Furness, and other abbeys. No attempt has yet been made to disencumber the buildings of the immense masses of *debris* which rise in huge heaps on all sides and conceal their original plan and arrangement and much of the architecture. The nave at Rievaulx is simply a confused pile of grass-grown rubbish, in which it is hopeless to discover any trace of its ancient form or details. The fragments of the lantern tower rise in a lofty mound on the crossing. The day-room or calefactory is heaped high with mossy *débris*, over which it is not very easy or safe to scramble. So also is the infirmary, a very curious room. The foundations of the chapter-house are quite hidden by turfy heaps of rubbish. The choir is least encumbered, but even that needs excavation, a work which would certainly bring to light interesting features of the original choral arrangements. Perhaps the work so excellently begun last year by Lord Feversham is only temporarily suspended. I hope this may be so, and that another season may see the commencement and earnest prosecution of a work of disinterment at Rievaulx, which will be certainly fruitful in discoveries, for which every archæologist will have cause to thank the noble owner.

I cannot close this letter, though already too long, without calling attention to the contrast presented by the neglected state of the noble ruins of Kirkstall Abbey. When I saw them last some of the most important parts of this historic building were in imminent danger of falling, and called for speedy attention to save them from ruin. I was told that the owner had been appealed to in vain, and that it was proposed to form a committee of the leading merchants and clergy and professional men of Leeds to consider what measures should be taken to arrest the decay which threatened the destruction of so noble a monument of antiquity, which by the spread of the town has almost become a part of Leeds itself. My informant also said that it was intended to call in the professional aid of Mr. Pearson. As far as I can learn, nothing has yet been done in this direction, and the ruin is fast becoming more ruinous.

Surely in the immediate vicinity of a town of such wealth and energy as Leeds such a building will not be permitted to tumble down for want of timely care. Even if the owner is unable or unwilling to undertake the necessary repair, let the movement be started, and Leeds will speedily provide the means for carrying out the work. Kirkstall, it is almost needless to say, is one of our very finest abbeys, any injury to which would be a national disaster.

EDINBURGH IN 1561.

THE visit of the Queen to the Edinburgh Exhibition has been taken as an opportunity by Professor Masson to describe in the *Scotsman* some of the circumstances relating to the visit of Queen Mary to the city when she returned from France. In his second essay he gives the following account of "The Plan and Fabric of the Town in 1561":—

Then, as now, the buildings that went by the general name of Holyrood were distinguishable into two portions. There was the abbey, now represented only by one beautiful and spacious fragment of ruin, called the royal chapel, but then, despite the spoliations to which it had been subjected by recent English invasions, still tolerably preserved in its integrity as the famous edifice, in Early Norman style, which had been founded in the twelfth century by David I., and had been enlarged in the fifteenth by additions in the later and more florid Gothic. Close by this was Holyrood House, or the palace proper, built in the earlier part of the sixteenth century, and chiefly by James IV., to form a distinct royal dwelling, and so supersede that occasional accommodation in the abbey itself which had sufficed for Scottish sovereigns before Edinburgh was their habitual or capital residence. One block of this original Holyrood House still remains in the two-turreted projection of the present Holyrood, which adjoins the ruined relic of the abbey, and which contains the rooms now specially shown as "Queen Mary's Apartments." But the present Holyrood, as a whole, is a construction of the reign of Charles II., and gives little idea of the palace in which Mary took up her abode in 1561. The two-turreted projection on the left was not balanced then, as now, by a similar two-turreted projection on the right, with a façade of less height between, but was flanked on the right by a continued chateau-like frontage, of about the same height as the turreted projection, and at a uniform depth of recess from it, but independently garnished with towers and pinnacles. The main entrance into the palace from the great outer courtyard was through this château-like flank, just about the spot where there is the entrance through the present middle façade; and this entrance led, like the present, into an inner court or quadrangle, built round on all the four sides. That quadrangle of château, touching the abbey to the back from its north-eastern corner, and with the two-turreted projection to its front from its north-western corner, constituted, indeed, the main bulk of the palace. There, were, however, extensive appurtenances of other buildings at the back or at the side furthest from the abbey, forming minor inner courts, while part of that side of the great outer courtyard which faced the entrance was occupied by offices belonging to the palace, and separating the courtyard from the adjacent purlieus of the town. For the grounds of both palace and abbey were encompassed by a wall, having gates at various points of its circuit, the principal and most strongly guarded of which was the Gothic porch admitting from the foot of the Canongate into the front courtyard. The grounds so enclosed were ample enough to contain gardens and spaces of plantation, besides the buildings and their courts. Altogether, what with the buildings themselves, what with the courts and gardens, and what with the natural grandeur of the site—a level of deep and wooded park, between the Calton heights and crags on the one hand, and the towering shoulders of Arthur Seat and precipitous escarpment of Salisbury Crags on the other—Holyrood in 1561 must have seemed, even to an eye

the most satiated with palatial splendours abroad, a sufficiently impressive dwelling-place to be the metropolitan home of Scottish royalty.

The town itself, of which Holyrood was but the eastward terminus, corresponded singularly well. Edinburgh even now is, more than almost any other city in Europe, a city of heights and hollows, and owes its characteristic and indestructible beauty to that fact. But the peculiarity of Old Edinburgh was that it consisted mainly of that one continuous ridge of street which rises, by gradual ascent for a whole mile, from the deeply ensconced Holyrood at one end to the high Castle Rock at the other, sending off on both sides a multiplicity of narrow foot passages, called closes, with a few wider and more street-like cuttings, called wynds, all of which slope downward from the main ridge in some degree, while many descend from it with the steepness of mountain gullies into the parallel ravines. Whoever walks now from Holyrood to the Castle, up the Canongate, the High Street, and the Lawnmarket, walks through that portion of the present "Old Town" which figures to us the main Edinburgh of Queen Mary's time, and is, in fact, its residue. But imagination and some study of old maps and records are necessary to divest this residue of its acquired irrelevancies, and so to reconvert it into the actual Edinburgh of three hundred years ago. The divisions of the great ridge of street from Holyrood to the castle were the same as now, with the same names; but objects once conspicuous in each have disappeared, and the features of each have been otherwise altered.

The first part of the long ascent from Holyrood was the Canongate. Though occupying nearly half of the whole, and in complete junction with the Edinburgh proper up to which it led, it was a separate "burgh of regality," which had formed itself, as its name implies, under the protection of the abbots and canons of Holyrood. By virtue of that original, it was not yet included in the municipal jurisdiction of the Edinburgh magistrates and town council, but held out under a magistracy of its own. Hence some characteristics distinguishing this lower part of the ascent from the rest. The old Canongate was by no means the dense exhibition of dingy picturesqueness now known as the Canongate of Edinburgh, with repulsive entries and closes on both sides, leading to cages of crammed humanity of the poorer sort, or to inner recesses of bone-yards, pipe-clay yards, and the like. It had the sparseness and airiness of a suburb of the court. The houses, whether of stone or partly of wood, were pretty thickly put together, indeed, along the immediate street margins, with the inevitable access to many of them by entries and closes, but did not go so deeply back on either side as not to leave room for pleasant gardens and tracts of vacant ground behind. A paved and causewayed street, ascending continuously between two rows of houses, of irregular forms and varying heights, but few of them of more than three storeys; other houses at the backs of these to some little depth all the way, reached by closes from the street, and generally set gablewise to those in front; and, behind these again, garden grounds and grassy slopes and hollows: such was the ancient Canongate. In token of its claims to be a separate burgh, it had its own market cross, and, near this, its own Tolbooth or prison and council house. The present Canongate Tolbooth, though an antique object, is only the successor of the older Canongate Tolbooth of Queen Mary's time.

The ending of the Canongate and beginning of the High Street of Edinburgh proper was at a cross street, the left arm of which, descending from the ridge into the ravine on that side, was called St. Mary's Wynd, while the arm to the right was called Leith Wynd. Here, to mark more emphatically the transition from the smaller burgh into the greater, one encountered the separating barrier of the Nether Bow Port. It has left no trace of itself now, but was a battlemented stone structure, spanning the entire breadth of the thoroughfare, with an arched gateway in the middle and gates for admission or exclusion. That passed, one was in the lower portion of the High Street, called specifically the Nether Bow. Here it was not merely the increasing breadth of the thoroughfare and the increasing height of the houses that showed one had come within the boundaries of the real civic and commercial Edinburgh. No such sparseness of building now as in the Canongate; no mere double fringe of houses to a short depth, with entries and closes ending in gardens and vacant ground; but a sense of being between two masses of densely-peopled habitations, clothing the declivities from the ridge to their lowest depths on both sides, and penetrable only by those courts and wynds of which one saw the mouths, but the labyrinthine intricacy of which in the course of their descent baffled conception.

The same sensation accompanied one on advancing still upwards into the middle and broadest part of the High Street. Here the street had much the same striking appearance as now. One saw a spacious incline of oblong piazza, rather than a street, lined by buildings, some of solid stone throughout, and very tall, others lower and timber-fronted, all of quaint architecture from their basements to their peaked roofs and chimneys, and not a few with "fore-stairs," or projecting flights of steps from doors on the first floor down to the causeway. It was here, too, that the lateral fringes of habitation down the steep alleys were of greatest width. That on the right was stopped only at the bottom of the ravine on that side by a lake called the North Loch, while that on the left, after reaching the bottom of the other ravine, mingled itself there with an independent and very aristocratic suburb that had grown up in the ravine itself, under the name of the Cowgate, as a southern parallel of relief to the main Edinburgh of the ridge above. This low-lying aristocratic suburb, though accessible from the piazza of the High Street by the wynds and closes on the southern side, did not come easily into the cognisance of a stranger that might be exploring the piazza itself. He had enough to arrest his attention where he was. One difference between the old High Street and the present, despite their general resemblance, consisted in a huge obstruction, now removed, which interrupted the old High Street at its very midmost point, immediately above the Town Cross. Just above the spot now marked in the causeway as the site of this Town Cross, and beginning exactly where the great church of St. Giles protrudes its complex pile on the left, and raises into the sky its remarkable tower and open octagonal crown of stonework, there stood in the old High Street a stack of lofty masonry, stretching up the centre of the street for a considerable way, and leaving only a gloomy and tortuous lane for pedestrians along the buttresses of the church on one side, and a somewhat wider channel, called the Luckenbooths, for shops and traffic, on the other. The lower portion of this obstructive stack of masonry belonged to the Luckenbooths, and was included in the name, the basement being let out in shops or stalls for goods, while the upper floors were parcelled out as dwellings. The higher and larger portion, separated from the lower by a narrow suture, called "The Kirk Stile," was nothing less than the famous Heart of Midlothian itself, or Old Tolbooth, which had served hitherto as the *prætorium burgi*, at once the gaol of Edinburgh, its Town Council House, the seat of the Supreme Courts of Justice for Scotland, and the occasional meeting-place of a Scottish Parliament. Little wonder if one lingered round this core of the High Street and of the whole town. The channel of the Luckenbooths on one side of the street, the lane between the Tolbooth and St. Giles's on the other, and the cross-passage or Kirk Stile, were worth more than one perambulation, if only on account of their amusing interconnection; at the back of St. Giles's Church, overhanging the Cowgate, was St. Giles's Churchyard, the chief cemetery of the town; and the Tolbooth alone might well detain one by its look and the interest of its associations. In 1561 they were voting it to be too old and decayed, if not too unsightly, for the various and important purposes which it had hitherto served; and within a few months from our present date there was to be an order for its demolition, and for the erection of another building more suitable for those purposes, and especially for the accommodation of the Lords of Council and Session. But, though they did then begin to take it down, and though a "New Tolbooth" or "Council House" was built near it in the same part of the High Street, the old or original Tolbooth escaped its doom, and was left standing after all. A little re-edified, it was to survive its more modern substitute, and to be known till 1817 as at least the Gaol of Edinburgh and real old Heart of Midlothian. Some persons still alive can remember it.

The Tolbooth having been passed, one was again in an open piazza of tall or tallish houses, nearly as broad as the former piazza, but further up the incline, and known indifferently as the High Street above the Tolbooth or as the Lawnmarket. Here, also, one could not but note the number of the closes and wynds on both sides, plunging down the house-laden slopes with break-neck precipitancy from the vertebral street. At the head of this piazza, however, where it began to narrow, and where there was an obstruction across it in the form of a clumsy building called the Butter Tron, or Weigh-house, there was one offshoot to the left of greater consequence than any mere wynd or close. This was the West Bow, a steep zig-zag or spiral kind of street of antique houses, bringing one down to the deeply-sunk Grassmarket or Horsemarket, *i.e.* to a large square space opening out from the end of the Cowgate, and convenient for the country people coming into the town with cattle. Refraining from this descent by the West Bow, and keeping still to the vertebral street, one reached the last portion of the long causewayed and inhabited ridge. This was the Castle Hill, a narrowish continuation of the High Street, so steep as to require climbing rather than walking, but up which, nevertheless, there was still a plentiful straggling of houses, perched anyhow, with closes and paved yards reticulating what lateral depth of earth they could cling to, and with views of dizzying profundity from their back windows.

All civic Edinburgh thus left behind, and a military portal having been passed, one entered the precincts of the castle itself, the high rocky stronghold which was more ancient than anything recognisable as most ancient in the Edinburgh be-

neath, which, indeed, had fostered that Edinburgh into its first existence and growth, and in which there were relics of days older than those of Malcolm Canmore and David I., older than the infancy of Holyrood Abbey. After the long walk upwards between the two lines of close-packed houses, with perpetual mouths of mere wynds and closes for a whole mile, it was something to emerge into the open air, even in the battlemented exterior esplanade or courtyard of this castle, slanting up the hillside to the moat and drawbridge. It was more to be allowed to pass the drawbridge and the other defences, and so to pursue the winding, rock-hewn track by which one mounted to the fortified aggregate of guard-houses, store-rooms, and royal towers, heaved together on the cliff-bound summit. What a platform then to stand on, beside the cannon, on any of the ledges of the embrasured parapets! The feeling for scenery, they say, had not been much developed in the sixteenth century; but no more in that century than in this could any human eye have gazed with indifference on the vast panorama of Scottish land and water that burst into the vision from Edinburgh's Castle Rock. To the north there were villages and farmsteads dotting the range of fields towards the Firth which is now covered with the streets of the new town, and beyond these always the unwearying loveliness of the face of the Firth, with the boundary of the Fifeshire hills; to the west, the near Corstorphines, and over these also a tract of varied country, fading away up the course of the Firth into a purple suggestion of Stirling and the first spurs of the Highlands; to the south, the Braids and the Pentlands, hiding the pastoral territory of the Esks and the Upper Tweed, with its sleepy stretch towards the Borders and England. Scores of castles and keeps, each the residence of some nobleman or laird of distinction, could be counted within this sweep of the eye, north, west, and south, over the immediate vicinity of Edinburgh. But, if one's interest were still rather in the town itself, it was the eastward glance that would help most to complete and define the previous impressions. The whole sea-approach to Edinburgh by the Firth was now splendidly visible, with the already described curve of the hither coast from Berwick Law to Leith; the road from Leith to Holyrood was plainly discernible; and the Canongate and Edinburgh could be looked down upon together, and seen in connected shape and ground-plan.

However slight the defences of the Canongate and Holyrood, Edinburgh proper, it could now be seen, was carefully enclosed and bastioned. On the north side, the North Loch, washing the base of the Castle Rock, and filling the valley through which the railway now runs, was sufficient protection; but all the rest of the town was bounded in by a wall, called the Flodden wall. It had been constructed mainly in the panic after the Battle of Flodden in 1513, to supersede an older and less perfect circumvallation, but had been much repaired and modified since. It started from the east end of the North Loch, and ran thence along Leith Wynd and St. Mary's Wynd, crossing the High Street at the Nether Bow Port, and so shutting out the Canongate; it then went so far south as to include the whole of the Cowgate and some space of the heights beyond the ravine of the Cowgate; and the west bend of its irregular rectangle, after recrossing this ravine a little beyond the Grassmarket, rivetted itself to the Castle Rock, on its most precipitous side, at the head of the High Street. There were several gates in the circuit of the wall, besides the Nether Bow Port, the chief being the Cowgate Port, which was also to the east, the Kirk of Field Port (afterwards Potter Row Port) and Greyfriars' Port (afterwards Bristo Port), both to the south, and the West Port, just beyond the Grassmarket and the sole inlet from the west. When these gates were closed, Edinburgh could rest within herself, tolerably secure from external attack, and conscious of a reserve of strength in the cannon and garrison of the dominating castle. Even if the town itself should yield to a siege, the castle could hold out as a separate affair, impregnable, or almost impregnable, within her own fortifications. Successful assaults on Edinburgh Castle were among the rarest and most memorable accidents of Scottish history.

ARCHÆOLOGY.

The Carlisle Clock Bell.—The old bell which was used for striking the hours in the Carlisle Town Hall was cracked in the recent fire. The following paper on it by the local archæologists, Mr. R. S. Ferguson and Mr. W. Nanson, appears in the Transactions of the Westmoreland and Cumberland Archæological Society:—

"Some time ago one of the writers drew up an account of the market bell of Carlisle, now in the Carlisle Museum, and dated 1584. The writer had no notion that the Corporation possessed a bell near two hundred years older than that, bigger and finer in every way. In fact it had never occurred to him to inquire on what the town clock struck the hours: a coil of wire for all the writer knew. However, Mr. C. W. Parker, to whose exertions local campanologists are so much indebted, informed him that the town clock struck on a large bell, which had an inscription on the shoulder. Of this Mr. Parker has since made a rubbing, and it turns out to be—

+ RADULPHUS COMES ⋮ DE WESTMORLAND ⋮ EFECIT ME FIE RI,

running round the bell in one line, except that the last two letters are put below the others for want of room. The initial cross is plain, but not precisely the same as that on any other bell yet discovered in Cumberland. The intervening stop, three roundlets, is the same as on the Scaleby tenor and on the fifth or 'Maria' bell in the cathedral. The letters are stately, floriated Gothic capitals, very like, but not identical with, those on 'Maria.' The initial letter in 'Westmorland' is a Gothic U. The bell, like the cathedral 'Maria' and the pair at Burgh-by-Sands, is long-waisted—a sign of antiquity. Its diameter at mouth is 26 inches; weight, therefore, about 4 cwt., exceeding that of the market bell (diam. 1 ft.) by about 3½ cwt., and only falling short of that of the cathedral treble (diam. 28½ in.) by about 1¼ cwt. It has three canons for suspension; no clapper, but a ring on the under side of the crown to which to attach one. The clock hammer strikes on the outside of the sound-bow.

"'Radulphus Comes de Westmorland' is Ralph Nevill, fourth Baron Nevill of Raby, 1st Earl of Westmorland, a K.G. and Earl Marshal of England. He was born about 1365; and in the 9 Richard II. (1385-6) when barely of years of discretion, was appointed by that king joint governor of the castle and city of Carlisle, and a commissioner for the guardianship of the West Marches; these honours were renewed in him in the 12 Richard II. In the 21 Richard II. (1397-8) he was appointed Constable of the Tower of London, and was also created Earl of Westmorland, and had a grant of the honour of Penrith from Richard II. On the landing of Henry of Lancaster he deserted his benefactor, and became one of Henry's chief adherents, fighting for him against the Percies, and by gross treachery getting into his power Archbishop Scrope and other partisans of Richard. By Henry IV. he was appointed governor of Roxburgh, and had a grant for life of the fee-farm rent of Carlisle. He accompanied Henry V. to France, and was one of the victors of Agincourt. He died October 21, 4 Henry IV. (1435), and was buried in the choir of the collegiate church of Staindrop (which he had founded and endowed), under a stately monument, whereon were the figures of himself and his two wives, Margaret of Stafford, daughter of Hugh, Earl of Stafford, and Joan Beaufort, daughter of John of Gaunt, Duke of Lancaster, whose portrait, by the way, is in the east window of Carlisle Cathedral. He was thus brother-in-law of Henry IV. His eldest son, by his second wife, was Richard Neville, Earl of Salisbury, who had also a grant for his life of the fee-farm of Carlisle, and was the father of Richard Neville, the great Earl of Warwick, commonly called the King-Maker. His youngest daughter, Cecily, married Richard Plantagenet, Duke of York, and of this marriage there were some twelve children, two of whom ascended the throne of England, namely, Edward IV. and Richard III. Another daughter, Phillippa, married the owner of Naworth, Thomas de Dacre de Gilsland.

"The Corporation have some other relics of Ralph Nevill besides his bell. There still exist six acquittances or receipts given by him to the mayor and bailiffs for the fee-farm rent.

"The Earl was probably governor of Carlisle in 1392, when a fire broke out in Carlisle which destroyed fifteen hundred houses in Castlegate, Rickergate, and Botchergate. Rickergate and Botchergate are what we now call Scotch Street and English Street, and though the number of houses burnt may be an exaggeration, the centre of the town and the north transept of the Cathedral were destroyed, including the seat of municipal government, whatever that was then called (Moothall, probably), and the neighbouring chantry of St. Alban's. It may be noted that the architecture of Redness Hall, formerly the property of the family of De Redness, and now called the Guildhall, points to its having been built shortly after the fire. If we knew what the Moothall, or Townhall, that preceded the present one was like, we should find it date from the same period.

"To go back to the bell, the citizens, impoverished by the fire of 1392, probably could not replace any bell which had been destroyed, or did not see the necessity of replacing it. But a governor of Carlisle would see the necessity of a good big bell to alarm the town and the garrison, and that is why Nevill seems to have caused this fine bell to be made. If such was his object, he was powerfully, though perhaps incidentally, assisted by William de Strickland, Bishop of Carlisle from 1400 to 1419, who in one of the earlier years of his episcopate raised the Cathedral tower 'a medietate ad summum,' and placed in it 'quatuor magnas campanas' (Leland); the sole survivor of which, the aforesaid 'Maria,' weighing nearly 17 cwt., attests the efficiency of the four as 'Fray bells.' Their predecessors, the bells which took part in the cursing of Robert Bruce by Cardinal d'Espagnol in 1307 (Holinshed), were probably

destroyed, like the predecessor of Ralph Nevill's bell, by the fire of 1392, the reality of which fire, doubted by Hutchinson and others, but corroborated during the work of cathedral restoration in 1856 (Purdy's lecture, p. 20), derives confirmation from the fact of new bells given by Strickland and Nevill in the very beginning of the fifteenth century.

"Of the intermediate history of this bell nothing is known; a conjecture has been made that Earl Ralph gave it to the chantry of St. Alban's, of which the name survives in St. Alban's Row, and that the city got it when the chantry was suppressed in the reign of Edward VI. How long this bell has been used for its present employment we can't say, or how old the town clock is; a portion of the train is of considerable age, though a modern escapement has been added during this century.

"It's long since this fine old bell was rung, but its tones must have sounded far and wide, even to Solport, if we can believe the old Border ballad—the 'Fray of Suport'—for the farmer's wife, who laments that the Mosstroopers have harried her farm, announces the arrival of her friends thus:—

> Captain Musgrave and a' his band
> Are coming doon by the Siller-strand,
> And the muckle toun-bell o' Carlile is rung."

CHURCH BUILDING AND RESTORATION.

Farnworth.—The church of St. Peter, Farnworth, will shortly be opened on completion. The building has been erected from the designs of Mr. R. Knill Freeman, architect, of Bolton.

Gorton.—Brookfield Church has been reopened after works of cleaning and decoration. A group of angels is depicted over the chancel arch. The chancel arch and wall margins are decorated in keeping with the picture. The spandrels of the nave contain rich Gothic foliage designs, with a medallion representation in the centre of each. Bands of fret ornaments, small battlement designs, &c., complete the treatment of these spandrels. The tones of colour are olive, citron, chocolate, &c., upon a groundwork of vellum colour. The aisle walls and the west wall have decorations in similar tones, with bands of pomegranate designs, quatrefoil ornamentation, &c. Upon the east wall of the south aisle a Gothic panel has been formed containing the Beatitudes. In the chancel the walls have been diapered of Gothic rose foliated design, with bands and borderings. On a label over the east window are the words, "Thy kingdom come, Thy will be done," the text being surrounded with hand-painted foliage. On the walls to the right and left of the window are, on one side a figure of Moses with the Tables of the Law, and on the other a picture of the Good Shepherd—the figures enclosed in a setting of canopy work and other enrichment. Throughout the church the stained woodwork has been re-toned. The work has been carried out, under the direction of the architects, Messrs. Worthington & Elgood, by Mr. Reuben Bennett, of South King Street, Manchester; and the pictures have been painted by Mr. J. Milner Allen, of London.

Netherton.—The new church of All Saints, erected from the designs of Mr. C. J. Ferguson, Carlisle and London, has been opened. The style of architecture is Early English, and the church provides accommodation for about 700 persons. The contractors were, for mason work, Messrs. Whillan, Netherton, and Messrs. Beaty Bros., Carlisle; joiners' work, Mr. Black, Carlisle; painting, Messrs. Kirk & Robley, Carlisle. Mr. Henry Luscombe was the clerk of works.

Pytchley.—The memorial-stones of a Wesleyan chapel have been laid. The building, which is being erected from the plans of Mr. Charles Saunders, architect, of Kettering, by Mr. George V. Henson, builder, also of Kettering, is shaped like the letter T. The centre portion comprises the chapel proper, and the two wings, two schoolrooms, a vestry, and a library.

Shustoke.—A new church is about to be built at Shustoke, Warwickshire. Messrs. Bodley & Garner are the architects, and the building is to be carried out by Messrs. Stephens, Bastow & Co., Bristol and London.

Shelf.—The memorial-stones of a Wesleyan chapel have been laid. The new structure is intended to accommodate 260 worshippers in the area and 120 in the gallery. The building will be Gothic, and is designed by Mr. Herbert Isitt, architect, of Bradford.

Wellingboro'.—The Roman Catholic Church was opened yesterday (Thursday). It is cruciform on plan, having a nave, transepts, and chancel with aisles, a lady chapel, an organ chamber, porch, and sacristy, 24 feet by 14 feet 6 inches, two storeys in height, with, in addition, a small fireproof room for the registers and treasures, above which is an oratory looking into the sanctuary. The porch has a richly moulded entrance doorway, with traceried windows above. The nave, 25 feet in clear width, has an open timbered roof, which is continued at the same height over the chancel, the division being marked on the exterior of a small lantern of pierced stonework. On account of the steep rise of the ground, eight steps are required at the entrance to the nave, six to the chancel, and three to the high altar. The rose window behind the altar is filled with stained glass by Messrs. Lavers & Westlake, and has double stone tracery, the inner stone tracery of arcaded form being designed for the evening effect when the beauty of the glass is lost. The altar is of the simple early form, a stone slab supported on marble columns in front, and also at the back by a low wall of alabaster, the wall being adorned with paintings by Mr. Joseph Bouvier, in gold and colour. The canopy of the altar is of stone of the ancient ciborium form, supported on columns 18 feet high. The whole is surmounted by a cross rising to a height of 30 feet, of the form of the labarum, the ensign of Constantine. In the lady chapel are paintings by Messrs. G. and J. Bouvier. The style of the church is late fourteenth century Gothic, freely treated. The main dimensions of the church are 100 feet in length by 50 feet across the transept clear between the walls, and the estimated accommodation, including the choir, is for about 400 persons. The contract has been carried out by Mr. F. G. Anstey, from the design and under the direction of the architect, Mr. S. J. Nicholl, of 1 Caversham Road, London, N.W.

GENERAL.

A Public Testimonial to Mr. Philip Horsman, of Wolverhampton, in recognition of his munificence to the town, is spoken of, and a committee has been formed for the purpose. A portrait of Mr. Horsman and a scholarship for the Art Gallery have been suggested.

M. Ferrario has obtained the commission for the scenery of Verdi's new opera, "Othello," which is to be produced during the winter at the Scala, Milan.

Mr. Alderman Goldschmidt, of Manchester, has invited the President of the Royal Academy, the Royal Academicians, and the Associates of the Royal Academy to dine with him on the 7th inst., on the occasion of the opening of the fourth annual exhibition of the City of Manchester Art Gallery.

Mr. H. H. Bridgman has been appointed architect to the Board of Guardians for the parish of St. Mary Abbotts, Kensington. A large number of applications were received. Six names were selected, from whom the appointment was ultimately made.

Columns have been found during excavations near the stairway at the northern wall of the Acropolis in Athens. They are said to belong to a period prior to the Persian wall.

The Vyrnwy Reservoir, which is only partly finished, has cost up to the end of June 1,382,213*l.*

Prince Putiakin has presented to the Russian Archæological Society a stone slab which was recently found in the course of some excavations at the Bologne Station on the St. Petersburg and Moscow Railway, along with some stone weapons and utensils. A representation of the constellation of the Great Bear was, although rudely, carefully drawn on the slab. Some years ago a similar slab was found near Weimar.

A Collection of Indian Folk Tales, gleaned by the Rev. Charles Swynnerton, is announced by Mr. Elliot Stock. The volume will contain a large number of stories gleaned from oral recitation by natives, and will be illustrated by native artists.

M. Devrez has been appointed successor to M. Bailly as architect of the cathedral of Notre Dame, Paris. The restoration of the south transept of the Cathedral of Meaux was directed by M. Devrez.

The Sixth Instalment of the Fantaisies Decoratives by M. Habert-Dys has been issued. It contains four novel subjects.

A Surveyor of Ecclesiastical Dilapidations will be elected for the diocese of Manchester in October.

The Tower of Pevensey Church is to be restored to its original proportions, the churchwardens of former years having solved the question of repairs by reducing the tower one storey.

Funds are being raised for the renovation of the church bells at Wootton. The bells are heavy for a village peal, and cannot be safely rung at present.

The Restoration of Earl's Barton Church Tower will soon be complete, the last stage of the work having just been commenced by Messrs. Harris, Knight & Simcoe.

A Fish Market is proposed to be built along the quay at Commercial Road, Aberdeen. The cost is estimated at about 3,000*l.*

The Severn Tunnel, which has been thirteen years in construction, and has cost 2,000,000*l.*, was opened for goods traffic on Wednesday. It is nearly four miles and a half in length, of which two miles and a quarter are beneath the arm of the sea. In its construction 75,000,000 bricks have been used.

The Architect.

THE WEEK.

Intending competitors for the Edinburgh Municipal Buildings should inquire how far the gift of 50,000*l.* by Mr. Carnegie for a free library will affect the proposed arrangements. When the offer was first made, it was suggested by the Lord Provost to Mr. Carnegie that the free library might form a part of the new buildings. Mr. Carnegie rather approved of that plan, for he said the money could be made to go much further than if a new site were necessary. On Tuesday the subject was brought before the Town Council, when it was agreed to take the opinion of the citizens at a public meeting. The only suggestion about a site that was given at the Council meeting was by one of the bailies, who proposed George IV. Bridge. It is, of course, necessary to gain the approval of the people to a scheme which will entail a rate of a penny in the pound, and many in Edinburgh say there are libraries enough already for students whose reading is not confined to novels. But, meanwhile, the question of site must remain in abeyance, and with it the arranging of the plan of the Municipal Buildings.

The meeting of the British Association was not utilised to announce many important discoveries relating to practical science. One, however, is worth attention. On Tuesday Mr. Turner was able to demonstrate that it is possible to increase the tensile strength of cast iron by the addition of silicon. It must be in proportion to the quality of the metal, for with too much silicon cast iron becomes weak. Hard iron requires less than soft. Examples were exhibited, of which the tensile strength was found to range from 15·8 to 18¼ tons per square inch, the average being 17 tons. A strength of 13 tons was obtained in a very soft working iron, made from cheap mixed scrap and silicon pig used in proper proportion. Hitherto 7 tons was supposed to be the average tensile strength of cast iron. Silicon has been used on a large scale in Middlesbrough, where about 20,000 tons of sound castings were produced from the mixture during the past fifteen months.

The Morris columns in Paris no longer present their monotonous appearance, for they are becoming quite gay with the announcements of the reopening of the theatres. The Théâtre Français and the Porte St.-Martin have bravely kept their doors open in the hottest part of the season, but when one is confined to the city the young comedians or "Patrie" cease to have perennial attractions. Therefore every resident looks to the octagonal columns as soon as the last days of August are approaching, and it is astonishing how interesting the first sight of a common play becomes to eyes that are wearied with white limestone. There are some changes. The Varieties has been altered, and will no longer suggest the architectural style of the early part of the century. The Palais Royal, warned by the failures of the past season, tries to bring back its old luck by introducing the electric light. M. Porel would gladly do so in the Odéon, but it is a subsidised house, and he has to obtain the approval of the Minister of Fine Arts before he attempts the innovation. We suppose it will be granted, for few theatres are more broiling.

Professor E. A. Freeman appeals for help towards the restoration of the Saxon church at Bradford-on-Avon, which is being carried out by Mr. Adye, architect. "Not long ago," says the Professor, "we were in great fright lest the whole building was coming down. The ancient, massive, unbuttressed walls seemed altogether giving way, and we had to shore them up while we devised means to make them safe. The walls were made of a casing of stone inside and out, with cement poured in between. In the course of ages the cement had vanished, and there was nothing to tie the inner and outer faces of the wall together. Mr. Adye has made the whole safe by gradually and warily pouring in new cement. It was a long business, but it has been successfully done, and St. Ealdhelm's walls stand again quite safe. The wooden roof, of course ages later than St. Ealdhelm's day, was getting in many places thoroughly rotten. The nave roof we have made good; we have kept every timber that could physically be kept, and have made no kind of innovation in those timbers which were necessarily new. But the walls and the roof have used up nearly all our money, and we have still two things to do. We want to mend the chancel roof, as we have mended that of the nave. We also want to do another thing, about which there may be some difference of opinion, but in which I firmly believe we are doing right. A great part of the south side of the church was covered by a building which had been added during the time when the church was lived in as a house. It is a building, I suppose, of the seventeenth century, of no architectural value, and it hides the south doorway and part of the blank arcade, which is such a characteristic feature of the church. We have, therefore, settled to take the late building down, all except the east and west walls, which act as buttresses to the ancient walls. These we design to leave, after giving them the shape of buttresses." To an appeal of this kind there can be but one answer from lovers of old English work.

A sort of federation of local scientific societies has been accomplished in connection with the British Association. One of the first ways of utilising the new organisation is likely to be the preparation of a record of prehistoric and historic remains. With the ordnance map so nearly complete, the work would not be difficult. But the Association might as well make arrangements for exhibiting maps, having remains indicated on them, in accessible places throughout the country. Railway stations and post-offices might with advantage have a sheet of the survey hung up as a guide to the position of the objects having scientific or archæological importance which are to be found in the neighbourhood. The case of Stonehenge was brought under the notice of the delegates of the societies. The owner will not be persuaded to hand over the care of the stones to the Inspector of Ancient Monuments, and there is no law to compel him. It remains to be seen whether he will continue inexorable against an appeal that would be expressive of the opinion of the few people who have any real interest in the preservation of the stones.

During the past year it appears there were 340 cases tried in the English County Courts under the Employers' Liability Act. The amount of compensation claimed was 49,446*l.*, but only 7,356*l.*, or about one-seventh, was awarded. Thirty-four cases were struck out, and seventy-five were settled. In Scotland there was a more remarkable difference. The number of cases tried was 143, and the amount claimed was 35,628*l.* 16*s.*, but all that was awarded was 2,377*l.* 10*s.* It is supposed that in several Scottish cases the award was only formal, and much larger sums were paid out of the courts. Ireland can only show fifty-seven cases. Whether that arises from the absence of employers to become liable, or from the difficulty of injuring so tough a race, might be subject for discussion in several departments of the British Association. The claims amounted to 6,526*l.*, and the awards amounted to 1,116*l.* 6*s.* 10*d.*

Dr. Schliemann is trying to obtain a firman to enable him to carry out excavations in Crete under similar conditions to those fixed by the Greek Government for the German exploration of Olympia, which has produced such important results. A colossal statue of a woman has been found in Crete at Hagiri Deke, the site of the ancient Gortyna. The head is wanting, and one arm. The other arm is broken off, but was found with the statue. The woman is richly attired, with one foot forward as if in the act of setting out to walk. On the base there are traces of an inscription which would make it the work of Eisidotus of Athens. The statue has been placed in the museum lately established at Heraclea. Grotyna has been prominently mentioned as a place where abundant remains ought to be found; it was there that Halbherr and Fabricius found the ancient legal inscription. England seems to have forgotten that explorations are worth the care of a Government.

FIFTEENTH-CENTURY WINDOWS.*

THE characteristics of a Perpendicular window are not difficult of recognition, for they are in general sufficiently distinct, although, as RICKMAN pointed out, there are some of them which may be taken for Decorated at first sight. But it would be strange if there was an equally definite variation in the character of the painting of the windows. Alterations in masonry and in figure-painting were not necessarily synchronous. Indeed, in the fifteenth century the painters were seeking for freedom, and apparently they were less disposed than their predecessors to exhibit loyalty to architecture. Like many men before and since, they confounded liberty with license.

The fifteenth century was a period of transition, and, in spite of the splendid windows which were produced, it is not every authority on glass who cares to praise the work of that age. Its best effects are supposed to be illegitimate, and as we are sticklers for legality in everything in England, Perpendicular glass has been treated as if it were a "nobody's child." The late Mr. WINSTON went so far as to suggest that when modern architects are erecting buildings in the style of the fifteenth century, however careful they might be in details of wood and stone, they were to avoid the imitation of fifteenth-century glass. Windows of the fifteenth century, he said, should be designed on the model of the glass paintings of the sixteenth century. Mr. GAMBIER PARRY, while recognising that improvements were introduced in the fifteenth century, cannot find a more appropriate phrase to describe them than "poison drops" by which the art was destroyed.

It is not an agreeable task to write the history of work that is supposed to be false art, for if it is praised the writer is said to be deficient in taste, or to go against accepted opinions in order to appear singular. But as an artist, Mr. WESTLAKE knows that much of what is condemned is excellent. In every period good and bad work was produced at the same time. Greek sculptors scamped their work occasionally; there were Mediæval men who can be called "jerry builders," and, on the other hand, this nineteenth century, which is supposed to do everything in a mechanical way, can show examples which are inspired by as noble motives as those which prevailed in Athens or Amiens.

Mr. WESTLAKE has a fellow feeling for artists, and, when he sees a fine example of glass, he forgets the consequences of admiring it. We are all supposed to be under the sway of a single style, and of one only, and it is not unlikely that people will forget all that Mr. WESTLAKE has written in praise of earlier work, and declare that he is an imitator of the fifteenth century.

Whatever may follow, Mr. WESTLAKE writes what he thinks. He tells us how "a thoroughly glass-like character of design was practised during the greater part of the fifteenth century, and some of the work of this period is of the finest quality." The heads of the first quarter are described as "drawn with knowledge and very great care, whilst the hair and features are lined with great delicacy." The foliage is said to present "greater simplicity of colour and design." We read that "whatever tone of colour was used it was harmonious; the rubies, blues, yellows, and whites were not chosen for their own individual value or brightness, but for the harmonised value that they gave to each other." Some or all of these judgments are the opposite of the accepted opinions on the qualities of Perpendicular glass.

Mr. WESTLAKE does not, however, overlook the real defects of the period. He explains, for instance, the influence of the endeavour to obtain pictorial or rather picturesque effects, by which the artist sought distinction for his own work without any care of its relation to the architecture. We learn also that as glass became only a ground like paper or canvas, it was no longer thought necessary to employ an expensive description, and in consequence a material "which is really little better than ordinary window sheet glass was in use from thence nearly to our own time, and, in fact, it is still used in some ateliers, especially on the Continent." It is only right for the fifteenth-century artists to have their defects brought to light, but there is no use in condemning the imaginary evils, as is too often done.

It is almost impossible to avoid rash judgments when general views of the history of art are taken. It will be remembered that Mr. WESTLAKE'S book is distinguished by the care which is given to particular examples. All the most typical specimens of a period are described in detail, and with this arrangement it is not easy to indulge in sweeping condemnations unless there is evidence for them.

The ideas of the time, coupled with the increased power which the artists possessed, impelled them to seek after richness, or, we might say, expensiveness in their details. The canopies which are generally introduced over the figures are so elaborate that a carver would find a difficulty in copying one of them in stone. The figures are clad in sumptuous robes, generally so capacious in size that one wonders how they could be borne in this life, and if the character of the subject was not an impediment the stuff is profusely ornamented. We can understand Mr. WINSTON when he said that an assemblage of the figures reminded him of court cards. A further element of richness is found in heraldry, for in no previous style was so much use made of shields and devices. It would be wrong in us to condemn the fifteenth-century mode of treatment. Artists and patrons had their own theory of æsthetics, and the way in which costly things are introduced in the windows enables us to realise the ideas which prevailed at a time when a new world was discovered which was supposed to abound in gold and silver, and where precious stones were to be picked up. The glories of paradise were no longer taken in a metaphorical sense. If they did not go so far as to believe, like CHRISTIAN in the "Pilgrim's Progress," that they were to be "put into an equipage" and ride about Heaven, the people could at least realise a place where the streets were paved with gold, where the inhabitants wore golden crowns and played on golden harps.

The English windows of the period are divided by Mr. WESTLAKE into three classes, viz., figure windows, Jesse Tree windows, and subject windows. It is too often taken for granted that the last are the most characteristic, as the artists would not regard the obstacles offered by mullions, but carried their composition across the window as if they were working in an open field. There are fortunately important examples surviving of the other classes to show us that there were cases where the design was accommodated to the stonework.

The South Kensington Museum possesses three figures from Winchester College Chapel. How they came there is related by the Rev. Mr. LLOYD, and as the transaction illustrates the way in which old glass can be treated at the whim of the clergy of a church, we reprint the story:—

> Early in the present century Messrs. Belton & Evans, glass stainers at Shrewsbury, were employed by the authorities at Winchester to fill with modern work some windows both in the cathedral and in the college chapel. Much of the old surviving glass fell into their hands, though I know not on what terms. The three great figures at Kensington seem to have been the only entire works; but a large quantity of unsorted fragments were carried off at the same time. The greater part was purchased by the Rev. W. G. Rowland, the then vicar of St. Mary's, Shrewsbury, to whose taste and liberality the collection of painted glass in that church is due. He set the Winchester glass at first in the chancel, where it remained for eleven years, but having afterwards obtained glass which he prized more highly, viz., the life of St. Bernard, in a series of panels, of which the drawing was attributed to Albert Dürer, he removed it, with the intention of re-erecting it in the south transept. He died, however, before his intention was carried out, and at the sale of his effects the glass fell into other hands, and the choicer pieces were purchased for the Kensington Museum.

Mr. WESTLAKE well says that what was left undone by fanatics was completed by cool and earnest men. With such an account before us, we can well believe all the stories of destruction which have been related.

The windows of Merton College, Oxford, are so near in character to those of Winchester, that Mr. WESTLAKE supposes them to have been produced under WYKEHAM'S influence. In All Souls College, among other figures are two of St. AUGUSTINE and St. GREGORY, which are interesting, as they are accompanied by the evangelistic eagle and bull. In the chapel of Exeter College there was some fifteenth-century glass. "I cannot find it in the present

* *A History of Painted Glass.* By N. H. J. Westlake, F.S.A. Vol. III. James Parker & Co.

building," says Mr. WESTLAKE, "after having searched most carefully; to me it was of more than ordinary interest, as it contained, amongst other portraits, those of WILLIAM PALMER and JOHN WESTLAKE, Canons of Newbury and Principals of Exeter College."

York Cathedral must be a place of pilgrimage to every student of fifteenth-century glass. The great east window is one of the glories of the art. It is known to be the work of JOHN THORNTON, of Coventry, who probably had settled in York. Mr. WESTLAKE believes that he also had in some way come under the influence of WYKEHAM. But the cathedral is not the only church in the city containing fine windows.

The English figure windows of the period are described in succession, and most of them are illustrated to some extent, but it would be impossible within our limits to refer even to the names. We therefore pass to what is said about the Fairford windows. Everyone knows that they have given rise to more discussion than any other windows in the country, and the controversy between Dürerites and anti-Dürerites has given an impetus to the study of stained glass. Mr. WESTLAKE is a doughty champion among the latter party, and he goes so far as to doubt whether DÜRER, with all his versatility, ever made a design for glass. The chief grounds for the belief that DÜRER was connected with the windows are the peculiar individuality of several of the figures, and the monogram of a capital A with a stroke above. There is no documentary evidence worth notice on the subject. Mr. WESTLAKE admits that there is a foreign aspect about a part of the work, but that is not unusual, he says, as the design of Continental glass was sometimes adapted to English needs, and there was intercommunication between the artists. In respect of some of the details he says :—

The canopies and ornaments are not more varied in design and execution than would ordinarily occur in the period occupied by the whole series of windows; the diversities of design in the figures were, as far as possible, neutralised by placing them in canopies suitable to the architecture and in one style. We find little of the foliage ornament, or of the interpenetrating mouldings, ever recurring in German work. There is a certain Flemish or German-like method of design in a great deal of English, French, and Spanish art of this period; and one is not entirely surprised that those who were not thoroughly acquainted with all our own productions of this period considered it to be German. The canopies are full of late Perpendicular peculiarities, mostly English looking, and the foreign features are not more frequent than is found in other glass of this period and in the country.

The windows with the Tree of JESSE for a *motif* are believed to have had their origin in the east window of Winchester College, which possesses additional interest from having figures of the designer, the carpenter, the mason, and the clerk of works. Gloucester has a window on a nearly similar plan, which is again found in York. The stem of the tree follows lines that are roughly straight, but in Margaretting, Essex, it is curved. The latter is a fine example, and on the strength of the mannerism in the costumes Mr. WESTLAKE infers it to be the work of JOHN PRUDDE, of Westminster, who designed the window in Beauchamp Chapel, Warwick.

The subject windows begin with the York windows, and then follow descriptions of those at Malvern Priory, Ticehurst, Long Melford, &c. Fairford is again described, and here also a subject of controversy is indicated. In one of the chapels is a representation of the *Transfiguration*, but on the breast of the figure of Our LORD are the letters I.H.S. surrounded with rays. Mr. WESTLAKE argues that the chapel must have been a Holy Sacrament Chapel, which seems reasonable, but he does not appear to have gained supporters among exegetists. He restored some of the windows, and a portion of the ruby glass was on that occasion analysed. It was found to correspond with English rubies, and Mr. WESTLAKE is justified in offering the circumstance as evidence. But the best evidence that the west window is English is, he says, found in the fact that the subject was designed for the window, and by an artist who probably had seen the stonework.

Mr. WESTLAKE next takes his reader across the Channel to examine fifteenth-century glass in France, Germany, Belgium and Italy. In France, the difference between the fourteenth and the fifteenth century is said to be less distinctly marked than in English examples. In Germany there was a change about the middle of the century, when the style that is represented by DÜRER and others became popular. Mr. WESTLAKE attributes it to "an accentuation of that angularity found in the Romanesque style, which had never died in Germany, rather than to any new infusion."

The chapter on Italian glass is of much interest. Mr. WESTLAKE says that a window in Siena Cathedral, which in his second volume he described as fifteenth-century work, is of the thirteenth century. The windows in the Cathedral of Florence, which are supposed to be GHIBERTI'S work, have been lately cleaned, and are said to be partly in the style of the fourteenth and partly in that of the sixteenth. In Florence there is uncertainty about their production. According to some accounts they were painted in Lubeck, after designs by GAMBASSI, a Florentine, who in one of the cathedral records is described as the greatest master in the art then living. Some of the windows have a startling effect of brilliancy. Mr. WESTLAKE says it was Mr. BURGES'S opinion that talc or a similar material was placed behind the glass; but from his own experiments he believes that the effect is owing to some burnished gold which is fixed a little way behind the glass. The most consummate example of Florentine glass is, according to Mr. WESTLAKE, the east window of Sta. Maria Novella. The church contains many treasures, and our author becomes indignant over the way in which the herd of tourists treat the building as a mere museum. What he says is applicable to other places as well :—

The *Frati* did make this as far as they could "a House of God" or "a Gate of Heaven." But in our days visitors, not only travellers from that vast Continent across the Atlantic—perhaps the chief sinners—but Englishmen and other foreigners forget that it is a place of prayer, a portico of heaven, and, instead of resting in studious delight or pious prayer, rush through the edifice guided by some cicerone whose object would appear to be only to earn some small fee quickly. Surely one is almost inclined to say, We are not living in an Art age, nor a pious age, nor even, with all its boastings, a great scientific age, but in a century of "Society," when we are satisfied with merely seeing things to boast of and talk about in this "Society." Is not this a period when few minds are seriously occupied with any subject above the hour taken over a short article—the stuffing of the goose who carries it about to flavour his conversation? The reader must forgive this bitter digression; but if he is a student, and sits in churches or palaces, or in art galleries, afflicted by this species of tourist, he will add his protest to mine, and perhaps think that, much as we talk of æsthetics, the ethics of art are ignored.

The final chapter in the third volume treats of heraldry, roundlets, monograms, quarries, &c. The history will be completed in four volumes, and it will be the best of all works on the subject, especially for the artist. Mr. WESTLAKE does not trust any eyes but his own; there is little taken on the authority of his predecessors. With a conscientiousness that is rare, he examines every fragment of glass that he considers worth description, and his remarks are those of a practical artist. We must say that the more often we refer to the volumes the higher becomes our esteem for the enthusiasm of the author who has placed such a treasury of information within our reach.

THE FADING OF WATER-COLOUR DRAWINGS.

THE Sections of Chemistry and Physics of the meeting of the British Association were occupied with subjects relating to light and colour. On Saturday Professor Hartley read a paper on a subject which has of late given rise to some controversy, viz., the degree of permanence belonging to water-colour drawings. He said there have been two ideas brought forward—one being that water-colour drawings fade on keeping, while others have contended that the tints increase in depth on keeping for a length of time. Hence, on the one hand it has been recommended to keep water-colour drawings in the light, while others have suggested that darkness is preferable. Colours used are of two kinds, mineral and organic. Mineral colours are generally unalterable, except in special cases, such as lead. The tendency is for red light to act as an oxidising agent on such colours, while violet light exerts a reducing action. But in the case of organic colouring matters

oxidation is promoted by light from either end of the spectrum. Acidity in any form is a great cause of the deterioration in water-colours. The chief sources of acidity are the impurities in the atmosphere in presence of moisture, imperfectly prepared colours, and the acidity of the paper. The paper is always itself slightly acid, and the use of size or gum is a source of acidity, while the burning of coal and of gas in towns produces a sensible amount of sulphurous acid in the atmosphere. The author has carefully examined the effect of acids, of exposure to sunlight, of hydrogen peroxide, and of sulphurous acid in the case of sixteen common water-colours. As a result he concludes that the character of the colours examined is very creditable to the manufacturer. Lakes are very permanent in pure air; while cases are known where indigo has remained unchanged for upwards of 1,800 years. Indigo is, however, liable to be attacked by acids. Generally the effect of chemical agents upon water-colours is what might have been expected from their chemical composition. Thus yellows containing cadmium sulphide are bleached by oxidising agents. In some few cases, however, unexpected results were obtained. Ultramarine is very readily affected by dilute acids; no preparation of lead should be used as a pigment either for oil or water-colour drawing. It is shown that many water-colour drawings have been exposed to light for fifty years or more in properly-arranged galleries without appreciable deterioration. The tendency is to produce apparently darker tints owing to the lighter tints being most liable to fade, while the brown colour developed in the paper itself tends to produce a similar effect. To preserve delicate sunlight effects the drawings should be kept in rooms imperfectly illuminated, and preferably with blinds transmitting a yellow or brown light. They should be carefully protected from the effects of an impure atmosphere, while paste or gum should not be used in affixing them. A slight wash of borax on the paper destroys its acid reaction, and makes the colours fix readily on the fibres. A small quantity of borax might be used in the water employed for mixing the colours. For illuminating galleries incandescent lamps are to be preferred to lighting by the electric arc, as the latter may be regarded as a sure means of destruction of the colours.

Mr. Crookes, after referring to the value of the paper to which they had just listened, mentioned that a committee had been appointed by the Science and Art Department to work with artists and chemists, and from the labours of this committee much benefit might be anticipated.

ST. ALBANS CATHEDRAL.

IT is gratifying to find that the elevation to the peerage of Sir Edmund Beckett has not, as often happens, put a stop to his racy letter writing. The letter of Canon Venables, which appeared last week on the "Preservation of Our Abbeys," has called forth the following rejoinder from Lord Grimthorpe, which is as characteristic as any of the preceding letters on the iniquities of architects:—

I agree with most of what Canon Venables says of the proper treatment of buildings which can never again be anything but ruins. It had all been said often enough before in one sense, but truth requires telling a great many times, and the example of the Duke of Devonshire and Lord Feversham may possibly influence the female owner of Kirkstall, and the male one of Castle Acre Priory, and others. So Canon Venables has probably done good by publishing it.

But why does he spoil a good case by chaining it to a bad one? One of the weaknesses of the present age of "great principles" is the inability to perceive differences. I should have thought a canon of a grand living cathedral which is always needing restoration could see the difference between the *mortua corpora* of defunct buildings and what we may call live ones for the use of living souls, though the canons of Peterborough could not. But these Mezentii who call themselves "true antiquaries" can see very little that they don't like, and invent in abundance to make up for it. As he chooses to try another kick at the walls of St. Albans and their preservation as a living church, I have a few questions to ask him, to which if he does not give distinct answers I shall know what it means.

1. What is the particular "Brummagem nineteenth-century finery" for which "all true antiquaries lament the wholesale destruction of old work, worn, homely, and failing" (*i.e.* falling) here? And what old work?

2. When did he last see it, and has he seen at all the nave since it has been restored and used for service? If he has, does he prefer it as it was before?

3. Does he think the windows, which have been very nearly all rebuilt and eight new ones added as much like twelfth and thirteenth century ones as possible, ought to have been built and rebuilt "so as to show their date and character on their face;" and is that the way he tries to get the Lincoln restorations done? It is true that architects' restorations always do show their modern character only too well, because they do not know how to get them done in the old way or will not take the trouble, and that is why they are so much and justly complained of, though few people know the reason. What Mr. Woodward said lately of the restorations here before I was master of them only erred in being short of the truth. The Scotts, father and son, would not let Mr. Longmire entirely rebuild the Early English windows and clerestory, but made him stick in new Chilmark stone in patches wherever the old clunch was not very much decayed. The result is that those are now the shabbiest parts of the nave, and yearly getting worse, and some day another set of patches will have to be put in.

4. What does he know or suppose (without writing to somebody to tell him) is now being done here in the way of Brummagem nineteenth-century restoration? And what fault has he to find with it?

5. Did he not himself, in a lucid interval in 1878, write in favour of our restoring the high roof over the nave instead of the later low one, which a great majority of "true antiquaries," and the R.I.B.A., led by the immortal author of the Law Courts, and all the ruinationists, swore by all their gods was the original one, and that the high "weatherings" or grooves on the faces of the tower meant anything but high roofs round it?

6. Does he maintain, as all those people do, that "architecture" as applied to restoration does not mean building as well in every respect as you can, but means either making incongruous additions intentionally unlike old work or copying any ugly or defective thing that must be rebuilt somehow? You may copy what is bad, but not what is good, for fear it should be mistaken for original.

7. I occasionally hear of true antiquaries making delightful mistakes of from five to eight centuries in distributing their abuse and praise between me and the old abbots, most of whom, I am sorry to say, were shamefully cheated by their architects and builders in the quality of their work. And an architect who is restoring a church near here thinks he cannot do better than imitate them, by building the walls of a tower as a thin shell of 4½-inch brickwork and flints with common concrete poured in between. Does Mr. Venables think such work as that, or mine and Mr. Longmire's instead of it, the best; and if "Brummagem" means bad (which he may settle with Messrs. Chamberlain and Bright), which is the Brummagem church-restorer—he or I?

TESSERÆ.

Precedent and Criticism.

HERBERT SPENCER.

THE influence of precedent has been much increased by unfair criticism. It has been the universal custom to enlarge upon all the beauties of the old buildings, and to pass over all the defects, and on the other hand all the imperfections of the modern ones are sought out and magnified, and all the merits passed over as unworthy of remark. The fact is that to an unprejudiced eye there are in many ancient examples far more glaring errors than in any modern buildings of the same character. For instance, if I recollect rightly, in the nave of Gloucester Cathedral we have ranges of plain and massive Norman columns supporting small circular Norman arches, producing the impression of great stability, and then we find the adjoining aisles lighted by pointed Gothic windows, with all the usual characteristic lightness of this style of architecture. What can be more inharmonious than such a mixture? If one of the moderns had perpetrated such an incongruity, his reputation as a man of taste would have been irrecoverably lost. Again, if one of the profession of the present day, a little more liberal than his brethren, happens in making a design in accordance with the style of some particular period, to introduce an ornament which was only used at some other era, although all the architects in England should not be able to offer any cogent reason why it should not harmonise with the other features of the building, he is at once sneered at by the critic, and stigmatised as a man of no purity of taste. But, on the other hand, if there should chance to be in the elevation of some cathedral a range of Gothic windows with angles of half a dozen different degrees of acuteness, producing evident want of unity in character, and anyone draws attention to the fact as a great defect, the case is quite different. Oh, no! this is one of the works of our great ancestors, and we must not dare to criticise the designs of such superior men. It is much to be regretted that such erroneous impressions respecting the ancients and their works should ever have crept into society: that same veneration for antiquity is one of the greatest obstacles, not only to the advancement of architecture, but to the progress of every species of improvement. Perhaps no more effectual method could be adopted to lower the dignity of mankind, and to reduce the general tone of society, than to accept the doctrine of the superiority of our predecessors: no

method better calculated to produce want of confidence and consequent danger of incapability than to instil the belief that we have retrograded instead of advanced.

Opportunities for Cement-making in Ireland.

ROBERT MALLET, F.R.S.

Henri Sainte Claire Deville, the illustrious French chemist, in the course of certain recent researches, has discovered that some compounds of hydrate of lime and hydrate of magnesia afford a cement of eminently hydraulic properties, and setting rapidly under water. He has further found that the natural dolomites, which consist of carbonate of lime and carbonate of magnesia, in proportions either of one atom of each or of two or three atoms of the lime carbonate to one of magnesia, if calcined at a very low red heat and ground to powder, produce without any other treatment a fast-setting hydraulic cement, which becomes so hard that it may be employed also as an artificial stone, which for architectural purposes retains the fine warm tint of colour of the dolomite in its natural state. Now, in many parts of Ireland dolomite is abundant as a quarry rock. It can be obtained of a fine creamy white colour, and very free from iron and manganese, which would in the preparation darken its colour as a cement. The amount of heat required for its calcination is very slight, and may with great advantage and cheapness be communicated in furnaces heated by gas evolved by the imperfect combustion of peat, employing a modification of Charles Siemens's regenerative furnace. The calcined stone can be ground by water power, and the casks for packing the cement may be a subsidiary manufacture, and even made from small native timber; but little skilled labour is required. The materials are all at hand; the product directly marketable. The process which has been given to the world by Deville is hampered with no patent. Here seem to be the conditions for at least one new industry in Ireland. Let us hope that the hint may not fall wholly unproductive.

Classical and Jewish Architecture.

PROFESSOR COCKERELL.

The resemblance of the plan of the Tabernacle in the Wilderness, with its surrounding court (the first in our series, B.C. 1491), and, still more, of the temple of Solomon, with the arrangement of the Greek and Roman temple, down to the Antonines at the end of the second century of our era, is very remarkable. In the first the parallelogram is preceded by a portico of an irregular number, namely, of five columns. In the second (1012 B.C.) we have the temple in antis. If we enter into particulars we are still more struck with their correspondence; we find, for instance, the irregular number in the temple of Jupiter at Agrigentum, one of the largest and most important of antiquity. Seven columns compose the front, and we are reminded of Solomon's saying (Prov. ix.), "Wisdom hath builded her house; she hath hewn out her seven pillars." Again, at Pæstum we have a temple (miscalled a basilica) with nine columns in the front. Other examples also might be cited. Again, of the temple of Solomon, that of Themis at Rhamnus, and the frequent temple in antis, with its pronaos and heiron, is the constant copy. The altar of sacrifice, that of incense, the laver, the table of shewbread, are all traced either in existing remains, in bas-reliefs, or in medals. The connection of classic and sacred architecture is thus apparent; and the author of "The Plagiarisms of the Heathen Detected" (Mr. Wood, of Bath) is borne out in this comparison of the plan and arrangement of temple architecture. The common error (and one to be carefully avoided) is the attempt to trace this resemblance in the styles, or the ichnographic figure of the parts and orders—the mere vesture of the scheme; and the failure in straining the texts and examples (Corinthian or Doric) to a perfect correspondence, either in Wood, Villalpandus, or his learned predecessor, Wilkins, has always thrown a doubt upon these interesting investigations; but the comparison of the plans makes the Tabernacle the type of the Greek and Roman temple, a work which Paul as well as Moses assures us was inspired by the Deity, "for see, saith He, that thou make all things according to the pattern showed to thee in the mount" (Heb. viii.). It is remarkable that the earlier contemporary works of Egypt show no similar arrangement; nor was it likely that Moses should adopt and recommend any form associated with Egyptian recollections. The circular form of plan is indeed traced in Greece, and Rome more especially, and amongst the Druids, but the most frequent by far is the parallelogram after the Tabernacle; in fact, the earliest inhabitants of the bordering countries were apparently monotheists. Their connection with the Jews through Tyre and Sidon, their respect for a people of superior knowledge and religious instruction, may well have sanctified their form with them. The ritual was the same with them. The idol took the place of the ark. With both the temple was the Domus Dei. Both were religions of sacrifice. The ritual was thus the originator of the form of the temple, and must always be so. The temple in antis became (with a view to ornament, and by the successive inventions for decorum and dignity) the prostyle, peripteral, dipteral, and pseudo-dipteral. The much boasted beauty of the Greek temple was not then an invention of taste, but one of ritual; and in the consideration of templar architecture, in all times and countries, this important fact must be carefully borne in mind. Another point of resemblance of classical and Jewish architecture of great import, since it is the hinge upon which the whole system of ancient architecture turns, is the employment of "costly stones, even great stones, stones of ten cubits, stones of eight cubits." Upon this practice the whole character and taste of sacred and classical architecture depends. The tenth book of Vitruvius treats chiefly on large stones and their transport. The type of Domus Dei admitted of no extension; the only mode of giving magnificence and dignity to temples, thus circumscribed in form and composition, was by the employment of monolithic masses, and by the exquisite detail of proportion, order, and sculpture bestowed upon them. The ancient world is full of examples of this remarkable principle, and the last and most signal one is that in the temple at Baalbec, by the Antonines, in which three stones measure in the aggregate upwards of 199 feet in length. The Saviour, whose religion was soon to supersede all ancient laws, constantly illustrates His arguments by this practice: "the head stone, the chief of the corner, which the builders rejected," are His constant metaphors; and His prediction that of these great stones "there shall not be left one upon another," is literally verified in the subsequent history of architecture.

Quarrying Granite.

G. W. MUIR.

The forces employed in breaking the masses of rock into the dimensions desired are powder and the wedge. In using powder, a hole is "jumped" to the depth required, and being filled with powder and closed at top, it is fired with a fuse, timed to allow the workmen to retire to a safe distance. The first shot generally does no more than shake the rock round the hole, and make a number of cracks. The hole is again charged, and these cracks become filled with powder. The greater quantity of powder produces a greater effect, and the rock is further shaken and opened up. A third shot generally brings down the mass, and makes it available for the cutters to shape into blocks. This is done by wedging, or the "plug and feather," the latter being a short piece of steel inserted in a hole in the stone between two thin pieces of iron. By striking the plug with a heavy hammer the stone is split into pieces of the size desired. At the Kirkmabreck quarries no powder is ever used, but the stone lies in the most favourable position for detaching. It is desirable to use as little powder as possible, as otherwise the rock is frequently shattered in a way not intended, but it is not possible in every quarry to dispense entirely with its use. In selecting granite it is advisable to consider the purpose to which it has to be applied. The stone best suited for a monument or a column in a position where it can be closely inspected, may be of a finer grain than if it has to be placed at a higher elevation. I have seen buildings with very fine columns of grey granite, so small in the grain that at the distance from which they could be seen the effect was no better than if they had been so many cylinders of zinc.

Italian Builders' Work.

C. H. WILSON.

Although there is not much employment for architects in Italy, there can be no question of the skill displayed in erecting their designs. The masonry is excellent, and the ancient Roman brickwork is rivalled by that of the present generation; houses are built of brick, in which all the exterior decorations are moulded in that material as perfectly as if executed in stone. The skill with which the Italian workmen build in brick may be exemplified by a notice of the Florentine practice of arching over rooms without centering of any description. Two thin moulds of board, the shape of the intended arch, alone are used; these are placed at each end of the apartment which it is intended to cover in, and pieces of string are stretched from the one to the other, guiding the workman as he advances in the formation of his arch, which he builds, uniting the bricks by their thin edges (greatly thinner than in those we use), and trusting entirely to the tenacity and quick setting of the cement. Plastering is carried to a perfection in Italy of which we have, I believe, no idea in this country; rooms are so exquisitely finished, that no additional work in the shape of house-painting is required, the polish of the plaster and its evenness of tint rivalling fine porcelain. At times the surface of the plaster is fluted, or various designs are executed in intaglio upon it, in the most beautiful manner. Scagliola, a very fine preparation from gypsum, is the material chiefly used. As an instance of the cheap rate at which this work is done, I may mention the ball-room in the Palazzo Pitti at Florence, which, including mouldings, figures, bas-reliefs and ornaments, was executed at a cost of two crowns for every 4 feet square.

NOTES AND COMMENTS.

THE regulations for the Paris International Exhibition of 1889 announce that no work of art or other object exhibited will be allowed to be copied or reproduced in any form, without the authority of the exhibitor and of the director-general. The latter officer has of course the right to sanction the production of general views of the courts. The removal of any work of art before the closing of the exhibition will be prohibited. In other cases special permission must be obtained. Intending exhibitors will be glad to hear that Customs duties at the ports, and all duties payable in Paris, will not be levied. Rent will not be charged for location in the building, but exhibitors will have to pay for expenses of installation and of decoration. The Government will take measures to protect the exhibits, but it declines to become responsible for accidents from fire or other cause. The exhibitors will have to insure their goods at their own expense. Foreign sections will have to provide their own guardians, who in case of need can summon the French police to assist them in case of necessity. It is recommended that exhibitors should mark the price of their goods in every case.

IT is evident that Corporation art galleries can be made to pay. Liverpool is not much of a patron of art, but the last autumn exhibition produced a profit of 1,803*l.* 17*s.* 7*d.* If to that sum be added the balance from the year before, the result is a surplus of 2,339*l.* 2*s.* 2*d.* The figures speak well, for, including catalogues, 3,419*l.* 2*s.* 1*d.* was received from the visitors. It is proposed to credit the library and museum rate account with 2,000*l.*, and to allow the remainder to be held towards the expenses of this year's exhibition. When it is found that so much is obtainable in Liverpool the question will be naturally asked how much is paid for admission to Burlington House? The Academicians do not publish accounts. Up to 1836 the average income was calculated at 5,000*l.* a year. Since that time the interest in art has grown, and three or four times the amount would probably be under the average receipts.

IN the erection of the Berlin Museum of Decorative Art the London example was imitated, and instead of finding a site where operatives and designers congregate, a fashionable quarter was substituted. The museum is in consequence a failure, and in Berlin that crime is not easily pardoned. The authorities of the museum are now deliberating about their next course of action. The wisest course would be to abandon the building, but that means a public confession of want of foresight. It is likely, therefore, that a branch museum on a grand scale will be erected. The Committee of the proposed Museum of Decorative Art in Paris will no doubt be warned by the Berlin example.

IT is already a question among the Belgian painters whether they ought to exhibit in Paris in 1889. They apply the old test, "Cui bono?" They are apprehensive that they will not sustain a comparison with the works of their neighbours. In Berlin, France was an absentee, and extraordinary precautions were taken in the selection of Belgian works. Whether the best pictures were selected is, of course, doubted by the artists of the rejected works; but the Belgians confess that they were beaten by England. What position can they hold against France and England combined? The Government appear to recognise the shortcomings of the Belgian artists, and therefore purchase modern French pictures for the public galleries. This remedy raised a storm, and it was increased when the local artists and visitors saw in the exhibition just opened in Ghent the best positions assigned to French pictures.

IT is difficult to please everybody, and when we find the Art for Schools Association going back for subjects to the Civil War between Royalists and Puritans, we suppose it was with the intention of satisfying two classes of patrons. There are probably school managers who think it is improving to children's minds if they are obliged to look every day upon portraits of *Charles I.*, his children, *Laud*, *Strafford*, and *Montrose*. For those of the opposite way of thinking there are *Cromwell*, *Fairfax*, *Hampden*, *Pym*, and *Milton*. The selection may have been forced on the Society, but there is no necessity that we can discover for bringing out the portraits on a scale that will try children's eyes. Subscribers are charged a shilling a portrait, and non-subscribers double that price. For that money reproductions ought to be obtained of the size of the original engravings. Photographs measuring $7\frac{1}{2}$ inches by $5\frac{1}{2}$ inches will not tell on the walls of a big schoolroom. It is the first time in which the Society's arrangements are of questionable advantage.

THE Wallace Tower at Abbey Craig, Stirling, which was designed by the late Mr. ROCHEAD, architect, is one of the most effective and picturesque memorials in Great Britain. It can be seen from a long distance, and the view from it suggests the exclamation of FITZ-EUSTACE, "Where's the coward that would not dare to fight for such a land?" The structure is to be a Walhalla of Scotsmen who were inspired with WALLACE's patriotism. A bust of BURNS, the poet, by Mr. D. W. STEVENSON, was unveiled in the hall on Saturday last. It was a gift from Mr. CARNEGIE, who has given other proofs of the interest he takes in Scotland, and it is appropriate, for next to WALLACE there is no more powerful factor in Scottish history than the Ayrshire song writer. Other gifts of the kind will follow. The Marquis of BUTE has promised a bust of ROBERT BRUCE, and a commission has been given for a bronze statue of WALLACE. The bust of the poet is modelled after NASMYTH's portrait, and it is placed on a bracket designed by Mr. KINROSS, architect.

PEOPLE occasionally are heard to complain of the arbitrary conduct of the Metropolitan Water Companies, but there is no power in London that can be compared with what is possessed by the Glasgow Corporation. Everyone knows that the Glasgow supply is so affluent as to excite the envy of visitors from southern towns, but the Waterworks Acts are drawn as if Loch Katrine was a small reservoir with a limited catchment basin. A Glasgow house is occupied by many tenants, but if any of them is found wasting, misusing, or unduly consuming water, the whole supply to the house can be cut off without going through the formality of a notice. What is more extraordinary, if the ratepayers are deprived of water for a year they are bound to pay their water rates to the farthing. Apparently the Water Commissioners have unrestrained powers, but the sheriff who presides over the Small Debt Court of Glasgow takes an equitable view of their position, and acts as if the Commissioners had duties as well as rights. A man had claimed 5*l.* 5*s.* damages because the water to his dwelling had been cut off for five days, while one of his children was seriously ill. The cause was a leak which was readily repaired. The representative of the Commissioners stood on his rights, but the sheriff said their conduct was unwarrantable, and awarded 2*l.* damages with costs.

AN amusing book might be written on the "Curiosities of Competitions," and if the subject were treated at the length it deserves it would occupy a good many volumes. One story that has come from Genoa is too good to be omitted from such a work, especially as it throws a light on the way in which judges go through their work. There was lately a competition among sculptors for a statue of VICTOR EMMANUEL, of whom, by this time, there must be as many effigies as we have of the PRINCE CONSORT. The models were stowed in a spare room of the theatre Carlo Felice. The caretaker was an old cavalry sergeant, who was loquacious on the subject of horseflesh. He says the committee who were the judges in the competition consulted him about the designs, and it was by his advice the model by Messrs. BARZAGHI & PAGANI was selected. But with all his desire to see the best form of horse perpetuated, the worthy guardian was not oblivious of his own interests. He made a legal demand of the customary percentage on the commission, and as the fortunate sculptors did not recognise his rights forthwith he has instituted an action. The issue will be watched with interest. Contractors say that it is impossible to carry out public works in Italy or to obtain a contract without a very liberal expenditure on what the French call *courtage*, which is one of the survivals of seignorial rights. It is comprehensive in its action, and extends from statesmen to sergeants.

ILLUSTRATIONS.

THE OLD CHATEAU, MOULINS.

THE etching we give this week is another example of the illustrations of architecture which appear from time to time in *L'Art*. The style of M. BRUNET-DEBAINES is well adapted for work of this class, and it will be interesting to compare his manner of producing effect with M. GAUTIER'S and M. LITOUX'.

Moulins is about midway between Bourges and Lyons, but it is not much sought after by artists, for the buildings shown in the illustration are all that are worth notice in the town as examples of Mediæval art. Of the fifteenth-century castle, the tower—locally known as La Mal Coiffée—is the sole survivor. The cathedral is only a choir.

The town is not without interest for the English visitor. Lord CLARENDON lived there while writing a great part of his "History of the Rebellion," and there STERNE laid the scene of the story introduced in "Tristram Shandy," and known as "Maria."

HOUSE, CROCKHAM HILL, KENT.

THIS house, designed by Mr. ARTHUR ARDRON, stands upon a very picturesque site on the main road, about equidistant between Westerham and Edenbridge. The external walls up to first floor level are built with local hammer-dressed stone, with Bath stone dressing for moulded work. The upper storeys are constructed of timber framing, with red tile hangings, the roofs being covered with strawberry-coloured Bordesley tiles. The plan, as shown, was arranged by the owner to be used during the summer as a simple cottage residence. There is stabling for six horses, with residence accommodation for gardener and coachman. Messrs. J. & J. GREENWOOD, of London, were the builders.

ANDREA VEROCCHIO.*

BY EUGÈNE MÜNTZ.

VASARI, when writing of Verocchio, tells us that the artist had a somewhat hard and crude manner in painting and sculpture, suggesting that his art had been acquired through infinite labour and study rather than through natural endowments. That judgment upon the author of the *Incredulity of St. Thomas* may appear to be rather severe, but after a close investigation one cannot say that the biographer was in error.

All that we propose to do now, however, is to consider the Florentine master as a precursor. Whatever may be the merit of his own productions, his importance to us consists essentially in the indications he has left and the path which he opened. The strongest title of Verocchio to fame rests on the fact that he was the master of Leonardo da Vinci, to say nothing of Perugino or Lorenzo di Credi. The Renaissance offers several of these apparent contradictions. The painter Mantegna was the pupil of the sculptor Donatello; the sculptor Michel Angelo was taught by the painter Ghirlandajo; Andrea Pisano began with Giotto, and Benozzo Gozzoli with Ghiberti. Is not all this another proof of the relationship which in those privileged days united one art to all the others?

Andrea Verocchio was born in Florence in 1435. His father, Michele de Francesco de' Cioni, belonged to a humble grade among the industrial classes of the city. He may have been a brickmaker. Andrea began with a study of the sciences, and like Brunelleschi, Piero della Francisca, and many other famous artists, he especially cultivated geometry. He was apprenticed to a goldsmith, and in gratitude Andrea joined his master's name to his own. Besides Baldinucci, he had Donatello for a teacher, and may have assisted the latter when he was engaged on the marble lavabos in the sacristy of St. Laurent. What seems certain is that Andrea, in common with the majority of artists among his countrymen, followed the goldsmith's craft in his early days.

The knowledge acquired in that way, and the initiation into the mysteries of a most delicate and difficult class of work, were advantageous to Verocchio when he tried his hand in sculpture. They accustomed him to fathom all the technical secrets, and to impart to his works that finish which distinguishes them. We must admire particularly his ability when he is dealing with bronze. His skill was so well recognised that in 1467 Luca della Robbia confided to him the casting of the two last compartments of the door of the sacristy of the cathedral of Florence.

Among the goldsmith's work of Verocchio mention is made by Vasari of certain brooches or buttons used for fastening copes, and which were preserved in the Duomo, together with pieces of plate. One of the latter class was a cup or vase, which was renowned. It was distinguished by a frieze composed of animals, foliage, and other ornaments. On another cup was a dance of children, remarkable for grace and beauty.

But as these works are not to be traced, Verocchio as a goldsmith is better known to us from a little bas-relief, *The Beheading of St. John the Baptist*, which was chiselled between 1477 and 1480 for the famous altar of silver which stood in the Baptistery. Taken as a whole, that altar, on which Pollajuolo, Bernardo Cennini, Antonio de' Salvi, and Francesco di Giovanni worked together, is not very attractive. The arrangement is still Gothic; there is no precision or distinction in the disposition, and, looking at it, one might suppose that the Renaissance spirit had not yet penetrated to the banks of the Arno, or that the goldsmiths were not so far advanced as the sculptors. But if judged separately, the little relief by Verocchio will be found to have originality and a vigour that is impressive.

I can well imagine Verocchio as slow and undecided in manner, and as a bad man of business. It took him a long time to emancipate himself; he was supposed to have abandoned goldsmith's work for sculpture, but after a time he as suddenly resumed it. Donatello and many others sought and preserved their liberty in a different way. When he took up painting it was with hesitation, and in truth it would have been better not to have meddled with that art.

The youth of Verocchio was marked by an event which must have often troubled his mind. In 1451—he was then sixteen—he and some of his comrades were amusing themselves outside the walls of Florence. They took to stone-throwing. Andrea had the misfortune to strike one of his friends in the temple and killed him. This homicide being due to accident, was not followed by any punishment from the magistracy, but the remembrance of it must have preyed on him and increased the indecision of his character.

The first statue that Verocchio executed was the *David*, in bronze, which was completed in 1476, and for which 150 fl. were paid. It was for the Palace of the Seignory, but all the world knows that it is now in the National Museum. The conception is most original. It was to stand in face of the *David* of Donatello, and to the exuberance of life, the poetry of that figure, Verocchio opposed the leanness of a Florentine *gamin*. The contours are clear, hard, almost angular; the expression of the face is exasperating and almost impertinent. Artists find great pleasure in the figure, but I must own that I am not so much touched by it. The realisation of character rather than of beauty was sought after, and the meagreness is pushed to the verge of caricature. Original the *David* is undoubtedly, but it is not beautiful.

During the pontificate of Sixtus IV. (1471–1484) Verocchio visited Rome, and we may ask, Did the journey have all the influence over him which is supposed? We are told how he was impressed by the masterpieces which were then in the city, and especially by the equestrian statue of *Marcus Aurelius*; how he resolved to give up goldsmith's work in order to devote himself to sculpture, and with what resolution he carried out his project. In all this exaggeration we may recognise the customary rhetoric of our old friend Vasari. If Verocchio studied and imitated antiquity, it was not in the fashion of Donatello, Mantegna, and Ghirlandajo. He may have admired antiquity, but his admiration was altogether platonic. No style differs more sensibly from that of the ancients than his; every one of his works proclaims this fact; every one shows that his bent was not towards classicism, but towards realism.

The monument of the wife of Jean Tornabuoni—of which the bas-reliefs are now deposited in the National Museum of Florence—is said to have been executed during his sojourn in Rome. But can we believe that Verocchio, a year after he had shown himself by his bronze *David* to be familiar with all the secrets of a statuary, could display the inexperience, heaviness, and rudeness which mark this work? It is not merely the declamatory character of the style, the execution itself is open to criticism. The construction is bad, the proportions are vicious, and the types are ugly. It is more reasonable to suppose either that what we see is not the tomb of Francesca Tornabuoni, and was executed before 1477, or that it is the work of one of Verocchio's pupils.

The oratory of Or San Michele, which is adorned with masterpieces by Orcagna, Donatello, Ghiberti and Nanni di Banco, also possesses one of the finest creations of Verocchio,

* From *L'Art*.

the group of the *Incredulity of St. Thomas.* It appears to have been commenced about 1476, and was fixed in its place in 1483. There is no other work of the master which shows such depth of religious emotion. The expression is grave, without being severe or hard. In the exchange of sentiment between Christ and the apostle, in the fine and penetrating psychological analysis, we can see the dawn of that power which was manifested fifteen years afterwards, when Leonardo painted his *Last Supper* in the refectory of Santa Marie delle Grazie. The deeply-cut and somewhat conventional draperies, with their angular folds, as Mr. Perkins remarks, suggest that Verocchio employed wet cloths for his model, a method which forbids a happy development of the lines, and those happier accidents which often result in most graceful dispositions.

The *Child and the Dolphin* originally was intended for Careggi, the favourite villa of Lorenzo the Magnificent, and afterwards placed on a fountain in the court of the Palace at Florence, is one of the most pleasing of Verocchio's creations. The *motif* is treated with equal simplicity and freedom. It may be remarked that in spite of what is said by Vasari about Verocchio's admiration for antiquity, no artist has less imitated the neatness and sweep of the contours of the Greco-Romano sculpture. His statues have a character that is essentially supple, with faces that have none of the antique regularity of outline, and which are more suggestive of painter's work.

The *Madonnas* in bas-relief by Verocchio (one is in the National Museum, the other in the Hospital of Santa Maria Nuova) are important works, and have exercised great influence on painting. The composition is of an extreme simplicity, the work is a little weak and in parts too subdued. To the polish of Mino, Benedetto da Majano and Civitale, Verocchio opposed suppleness and softness of flesh ; the infant Christ is represented as a chubby child, with dimples on the arms and legs ; in a word, we can see everywhere with what ardour the master studied nature, and how well he could utilise the casts which he took from different parts of the human body.

The bust of a young woman holding a flower, now in the National Museum, shows the personality, suavity, and incompleteness that marks the style of Verocchio. Some parts, such as the hand and the wrist, have a delicacy that Leonardo might not disown : the countenance is sweet, and wears a smile of exquisite grace. But how much exists to provoke critics in the construction of the figure, on the setting up of the parts, and in the contours ! The artist was so absorbed in the details that he overlooked the general effect. But what signify defects against the salutary reaction which the figure exemplifies, in its softness and ardent curiosity, against the coldness, dryness, and banality that the Tuscan school with Mino and Civitale helped to introduce into sculpture ? Verocchio wished to make flesh palpitate ; a little later he would try, like Leonardo in the *Joconde*, to make the throbbing of the temples be felt.

The cathedral of Pistoja possesses the sketch of a grandiose monument of the Cardinal Fortequerra, which Verocchio dreamt of erecting. But he was surprised by death before he executed more than a few of the figures. Two angels in particular, who seem partly running, partly flying, are among the most characteristic and the most charming of his creations. The attitudes are uncomfortable, the foreshortening rather hazardous, the draperies are broken up and crumpled ; but what grace is found in the heads—although it may be a little affected—what charm in the smile of the two divine messengers, who are indeed angels and not genii, which is another proof of the independence of the artist when tested by antique tradition.

Verocchio, as we know, had abandoned goldsmith's work for sculpture. His ardent spirit, always eager to extend its knowledge, wished to have a turn with painting. He began with a cartoon representing a combat between naked men, for among the Italian innovators anatomy held an important *rôle*. He worked hard at drawing. Vasari gives great praise to the beauty of his female heads, and points out their distinction and the coquettish arrangement of the hair. I believe, however, that his drawings with a pen, which were lately exhibited in Paris, are more suggestive of the sculptor than of the painter. The style is hard, unfinished, without delicacy or picturesque effect.

Of all the pictures by Verocchio, one alone has come down to us bearing marks of authenticity. It is the famous *Baptism of Christ* in the Academy of Fine Arts at Florence. According to tradition, the young Leonardo da Vinci painted the angel that is near Christ, and when Verocchio saw the skill of his pupil he renounced painting forthwith. The work is far from being satisfactory. The Baptist appears to be a portrait, and the model was not of a kind to inspire an artist. The man is beardless, but not young, and without any sign of enthusiasm. He was probably some Florentine merchant or artisan. Verocchio was no less independent of the traditions of Christian art than of those of antique art. His Christ is without beauty. The figure is stunted, and without anything that would suggest a superior nature. As if to impart an air of vulgarity and poverty, the veins of the hands, arms, and legs are emphasised with elaboration. As to the draperies, they are more contorted than those of St. Thomas in Or San Michele. The two angels, on the contrary, especially the figure painted by Leonardo, are full of grace, and afford a contrast to the remainder. The background—a fantastic landscape—is also in Leonardo's manner. The colouring is thoughtful, and we there see the influence of brown as in his pictures. It is remarkable that the painters who issued from Verocchio's atelier—Lorenzo di Credi, Perugino, and Leonardo—were colourists of the first order.

Although he may have rarely used the pencil, the influence of Verocchio on painting has been very great. M. Bode has explained that a series of pictures must have been produced under the inspiration of the painter-sculptor, or in his atelier. The principal among them is a Madonna in the Louvre, in the "Galerie des Sept Mètres," and attributed to Cosimo Rosselli. The pictures are generally of an extreme simplicity. The Blessed Virgin is seen standing in half-length, and the infant Christ is standing or seated ; that is all the composition.

There are numerous designs in public or private collections which enable us to follow the preoccupations of Verocchio, his attempts, his conquests. We can see among them parts highly finished beside attempts almost formless, some foreshortening that if timid is not conventional, heads carefully studied, horses which are rearing or neighing, entirely in the style of Leonardo.

The principal work of Verocchio is the equestrian statue of the famous condottiere, Colleone. It and the *Gattamelata* of Donatello are the finest of the Renaissance works of the class.

Colleone having enriched himself in the service of the Venetian Republic, bequeathed to it considerable sums. In recognition of his munificence and as a souvenir of his exploits, the Senate resolved in 1479 to erect a monument worthy of him in one of the principal places of the city. It was also considered that a master could not be found for its execution more justly famous than Andrea Verocchio. The price fixed was 1,000 Venetian ducats, or about 100,000 francs (4,000*l.*).

The artist undertook the work with ardour. He had completed the model in clay of the horse, and had commenced the preparations for the founding, when, after a course of intrigue, Vellano of Padua obtained the commission for the figure of Colleone. Verocchio became indignant. He broke the legs and head of the horse and then fled to Florence. The Venetian Senate decreed that if he should ever return to Venice he was to be decapitated. The reply of Verocchio to this threat was a proud one. "You had better be cautious," he wrote, "about cutting off my head, for it is not in your power to readjust human heads once they are separated from the trunk, or to make a head like mine, which knows how to put a head on the horse much better than the one that was broken."

The senators were struck by the answer : they recalled the sculptor, and doubled his price. Verocchio succeeded in mending the model he had broken, and completed the clay model of the horse and rider. But he died before he was able to cast the colossal mass, leaving the task of carrying out the operation to his pupil, Lorenzo di Credi. As Lorenzo was not competent to undertake a work of that magnitude, it was entrusted to a Florentine, hitherto unknown, named Giovanni d'Andrea de Domenico. We are ignorant of the circumstances under which Alessandro Leopardi came to terminate the statue.

The *Colleone* is distinguished alike by the power of the horse and the pride of the rider. Superior in this respect to the *Gattamelata* of Donatello, Verocchio has been able to suggest the influence of the man over the horse ; the fusion is more complete, the rhythm and harmony are grander.

By his will Verocchio made his pupil, Lorenzo di Credi, his universal legatee. To his brother Thomas he left two houses in Florence and his claims on the guild of merchants, to each of his two nieces ten florins, to his servant five florins. Like Donatello and Da Vinci, he remained unmarried. Verocchio was only fifty-six when he died. His remains were brought to Florence by his favourite pupil, Lorenzo di Credi, and were honourably interred in the church of St. Ambrose.

Verocchio was at once goldsmith, perspectivist, sculptor, engraver, painter, and musician. The last accomplishment is worth notice, for it shows by what affinities of taste Leonardo resembled his master. There were other analogies. Leonardo also made an equestrian statue like Verocchio, and like him, but with a far wider grasp of intellect, he studied the positive sciences.

Verocchio resembled Donatello in working in all materials of sculpture, terra-cotta, marble, bronze, and wood. He had a great reputation for his works in terra-cotta.

The atelier of Verocchio was a fertile nursery. Beside several artists of talent, there came from it Nanni Grosso, Agnolo di Polo, and Francesco di Simone Ferrucci, the sculptors ; two of the greatest painters of the early Renaissance, Perugino and Lorenzo di Credi ; and, above all, Leonardo da Vinci.

A man like Verocchio, with his spirit of inquiry, his love of investigation, and his inquietude, could hardly fail to open

many new ways for art. In the first place, he did much to extend the use of casts. He took casts from hands, arms, feet, knees, legs, and torsos. In this way he contributed to develop the taste for funereal masks, by means of which the features of a large number of Florentine celebrities have been preserved for us.

The Tuscan master gave to his pupils something else besides ready-made formulas. He taught them to think and to inquire. The atelier of Verocchio was a laboratory of inventions. Lorenzo di Credi, who was of a contemplative nature, had his share in the experiments which were so dear to Verocchio and his co-disciple, Leonardo. Vasari speaks of his copies of medals in clay, which were done on a waxed cloth with a liquified earth, and which were deceptive reproductions of models. If we consider the elements of the style created by Verocchio, we are in the first place struck by the predominance of effects which are purely picturesque. They form the most complete contrast with the manner of his predecessors, beginning with Donatello. The outline, except in the *David* and the *Colleone*, may not have monopolised his attention, but what a latent life appears in his figures; how his draperies approach reality, as if the sculptor had been seeking effects of chiaro-oscuro.

The type of beauty that found most favour with Verocchio is of the sorrowful kind, but with a vivacity that is not free from malice. The Florentine women of Ghirlandajo are proud and impassible, those of Botticelli are bewitching from their naïveté and tenderness, but those of Verocchio are dreamers and melancholic; they have upon their lips that saddened smile which is so alluring in the figures of Leonardo. Whatever there are of feminine or effeminate qualities in the art of Da Vinci, the delicacy, the softness, the suavity are to be found—although often in the state of germ—in the works of Andrea Verocchio.

In him we see the modeller enamoured of form, and pleasing himself with the search for it, and with the power of his plastic hand in modifying it; while in Donatello and Mantegna we see rather the literary temperament, and in order to express the passions which excite them, and to realise their ideal, these masters need a vast theatre, numerous scenes and dramatic subjects. With Verocchio and Leonardo there is no necessity for *mise en scène*, or pursuit of ideographic effects. The simplest *motif*—a boy playing with a dolphin, a woman holding a flower, gives sufficient opportunity to them to exhibit all their science and poetry. Artists of their class rarely exercise influence over the multitude, but their works will always give delight to men of refinement.

METHODS TO BE USED IN TAKING QUANTITIES AND MEASURING UP WORKS.

BY THE MANCHESTER SOCIETY OF ARCHITECTS.

IN 1866 the Manchester Society of Architects issued a "General statement of the methods recommended to be used in taking quantities and measuring up works." A revised edition was issued in 1873. A further revision took place in July of the present year. By permission, the whole of this important document will be reprinted in *The Architect*. As it forms an authoritative manual on the subject, we feel assured that it will be found useful as a standard to architects, surveyors, and builders throughout the country:—

Note.

In taking quantities it will always be desirable to bear the character of the works in mind, and so to measure and describe them as to give parties estimating the clearest idea, and at the same time in the most concise manner, of their cost and character.

In measuring-up works already executed, it is of course only necessary to ascertain on what principle of measurement the prices have been determined, and then proceed accordingly.

Generally.

Fees to corporation, hoarding, propping sides of foundations or walls, and use of water for the different trades, to be mentioned in the trade that has to provide them, or under the head of charges to be borne by the general contractor. (If the right of advertising on hoarding is to be reserved by the proprietor, it should be so stated.)

Each trade to provide its own scaffolding, unless specially mentioned.

Each trade to provide its own mortar.

Protecting masonry with slabs, &c., to be put by preference in carpenter's work.

Expense of watchman, making good damaged work, &c., to be inserted as occasion may arise.

Each trade to provide for the expense of the attendance on the other tradesmen, and for cutting holes and making good, &c.

When the general contractor is expected to be responsible for damage by fire, an item for insurance is to be put in the quantities, by preference in the carpenter's work.

Any provision or sums of money or values for articles, shall denote the net cash to be paid by the builder, exclusive of his profit and of the cost of materials and labour required for fixing, which, however, should be fully stated.

Clerk of works' office and custody of drawings to be provided for.

Excavator.

1. Stripping surface soil deep, and wheeling in heaps yards run, to be measured in superficial yards.

2. Excavating to be given in cubic yards, measured to three inches beyond the outer edge of footings, with extra beyond for batter of sides of excavation, depending on depth and nature of soil. State whether material is to be left on the ground or carted away; and if wheeled, state the distance. Extra price for wheeling every twenty yards run additional. The excavating for each successive depth to be kept separate, and the nature of the material to be excavated to be mentioned if possible.

3. Excavating to trenches for walls, &c., to be measured in cubic yards, and to be kept separate from the above, as also for underpinning or any special work that has to be executed separately.

4. Filling in and ramming to foundations, to be given as an item, or, if thought desirable, to be done by day work.

5. Clearing away rubbish from time to time, to be given as an item.

6. Filling in or forming foundation for paving and flagging to be taken in superficial yards, and state depth and material; or add this to the item of paving or flagging in mason's work.

7. Drains to be given in lineal yards with description thereof, to include cutting trenches and laying; describe method of jointing and filling in; and state average depth of each kind, and when practicable, mention whether in rock or other kind of ground.

8. Junctions, bends, &c., to be counted extra beyond the length of drains.

9. Cutting trenches and filling in to gas and water-pipes (see plumber), to be given in lineal yards.

10. Wells, cesspools, eyes, &c., to be given with proper particulars, as the work may require.

11. Keeping foundations clear of water beyond ordinary rainfall, and for propping to streets or adjoining buildings, to be given as items.

Bricksetter.

1. Give description of materials and mortar and quality of work. The work, unless otherwise mentioned, to be reduced to one brick thick, and called "Brick-length Walling" in yards super. If sand, gravel, or water on the spot is not intended to be used, state so. If there be much work of half a brick only it is desirable to mention it. Where a building is lofty, it is desirable to divide the work into stages vertically.

2. To obviate any misunderstanding as to so-called trade usages, with regard to other materials, as stone, &c., built in, it is proposed to measure the net quantity of brickwork to be executed, deducting entirely all labour and materials in openings having more than 100 square feet "face" measure, and deducting materials only (leaving "hollows" for labour) on the following:—

a. All other openings than the above, the shape they are actually executed, provided they are openings in the walls and built above with the same materials.

b. All sills, strings, cornices, &c., and other masonry or dressings built in, and being six or more inches high. The "hollows" thereon being assumed to pay for the labour in providing proper bed therefor, filling up thereto, and pointing up.

c. Fireplace openings from underside hearth, and all flues, to be deducted as "hollows," and the lineal dimensions of flues (with size, if various) to be given for extra labour forming, pointing, and coring out.

3. Joists and beam ends, wall plates, door frames, band and gudgeon stones, codge stones, beam stones of ordinary dimensions, not to be deducted if built in with the work.

4. All walls finished with a bevelled upper edge, as to gables, eaves, &c., to be measured to 3 inches above the average height, and the lineal dimensions of "beam filling" between spar feet and of "gable cutting" given.

5. Any work intended to be whitewashed, to be measured "superficial," over all openings for pointing.

6. All splay cutting (with width), bevelled arrises, moulded arrises, bands of fancy work (with description), cutting to any shape not square, for ramps, hood moulds, &c., &c., double or other shaped reveals, to be given lineal.

7. Stops to chamfers, and other single points requiring special labour, to be counted.

8. All brickwork in projecting bands, cornices, &c., to be measured as walling, the labour as above in No. 6.

9. Facing to be measured super for "extra price over common," and the net quantity executed only to be given, after deducting all strings, sills, &c., &c. All openings less than 100 feet to be deducted and kept separate as "hollows for extra labour over common work," to pay for the labour, plumbing and setting out. Reveals to be measured for facing separately.

10. Cavity walling to be measured the actual thickness of the bricks, as, for instance, to be measured at 1½ bricks or 2 bricks, &c., as the case may be, and the superficial dimension of the wall measured across all openings under 100 square feet, as "extra labour and extra materials for bond, forming cavity walls." The nature of the ties to be mentioned.

11. Work in cement, or other material than the general run, to be taken for "extra price over mortar," and the description of the material given.

12. Backing up to ashlar walling to be kept separate from the ordinary walling.

13. Wrought-iron bond, if used, to be given in lineal feet.

14. Common relieving arches to be counted with average span, and separated into various thicknesses of wall, and number of rims in depth, and this to cover all extra labour and materials.

15. Arches in facing to be either counted, with spans, depth, and soffit given, and this to include all extra labour and materials, including skewbacks, and cutting super-imposed work to fit the rake; or else measured super as executed for "extra labour and materials over facing," girthing the face and soffit net, and measuring separately the skewbacks, and cutting super-imposed work to fit the rake when the shape of the arches requires it.

16. Ordinary arching to fireproof floors, &c., to be measured stuff and work in square yards, with description and thickness, girthing along the line of average thickness, and measure the lineal feet of skewbacks with description. Groins to be measured lineal. Allow for cutting and fitting to ironwork.

17. Trimmer arches to be counted, with average size for "stuff and work," including backing-up, and state whether solid or concrete backing is intended.

18. Backing to arches that have been measured as in No. 16 to be taken super, with average thickness and description of material.

19. Damp-proof courses to be given lineal with widths.

20. Risers for slopstones, steps, flag shelves, &c., to be counted for "stuff and work," or, if measured as walling, to be kept separate, and so stated.

21. Wine bin divisions measured super, with thickness, and kept separate, or with the above.

22. Eyes, air-grids, chimney-pots, setting grates, or other special items, to be counted with description, and the mode of executing the work.

23. Covering walls to protect them on special occasions, and manner of doing it, to be added to the bricksetter's contract.

24. Items: To cleaning down, making good, pointing, &c., at finish.

25. It would be well to call the contractor's attention to the fact that his price must include making good any damage done by frost.

26. Concrete in foundations to be measured by the cube yard.

(To be continued.)

THE AIR OF SCHOOLS AND DWELLINGS.

IN *The Architect* of July 2 a description was given of the new process of testing air that was devised by Dr. Carnelly, the professor of chemistry in Dundee. A paper was read by Dr. Carnelly at the meeting of the British Association, in which he described an elaborate series of experiments undertaken by him at Perth and Dundee, in connection with the sanitary and school authorities, the object being to determine the relations between the composition of the air and the death-rate in houses and schools, and also the effect of various systems of ventilation. For this purpose the carbon dioxide, organic matter, and micro-organisms were determined, both in the outside air and in the room to be examined. In the air of the towns of Perth and Dundee a distinct increase of impurities could be detected in close parts of the towns as compared with the open spaces. In examining the dwelling-houses the experimenters had authority from the sanitary officers, and visited bedrooms and similar places during all parts of the day or night, while actually occupied by the inhabitants. Houses are divided in the tables into one, two, and four-roomed dwellings, and mention was made of some cases in single-roomed dwellings in which eight persons were found sleeping in a single bed, and in many cases no bed was found in the dwelling at all. The impurities in the air of such houses were naturally much greater than in the better class, and by a careful comparison of chemical composition of the air with the death-rates from various causes in the various classes of houses it was shown that on an average the length of life in a one-roomed house was only twenty years, whilst that in better-class houses is forty years. Hence a person born and living in a one-roomed house has a chance of living only half as long as those born and living in a four-roomed house. This depends naturally to a considerable extent on other causes than impure air supply. Some irregularity was observed in the cases of consumption, scarlet fever, and diphtheria, which is, however, quite capable of explanation. The influence of cubic space on the purity of the air in dwelling-rooms was somewhat unexpected, the best results being noticed when 1,000 cubic feet was allowed for each person. With larger rooms, owing to stagnation of the air, the result is not so good. Sixty-eight schools were examined; of these twenty-six were mechanically ventilated, while the others were ventilated by means of windows. The advantages were distinctly in favour of mechanical ventilation, the micro-organism being one-seventh and the carbon dioxide one-half of that in the other schools. Mechanical ventilation not only materially improves the quality of the air, but also has less influence in unduly reducing its temperature. On comparing together boys and girls' schools, the air is almost invariably less pure in boys' schools. The amount of carbon dioxide does not afford any indication of the amount of organic matter or micro-organism, except by taking the mean of a large number of experiments. Cleanliness of person has a comparatively small influence on the number of micro-organisms, but cleanliness of dwelling-rooms and schools has a most important effect. Hence the air of new schools is distinctly better than that of older buildings. In conclusion, the author suggested that in many cases the evil said to be due to over-pressure in schools was doubtless due to imperfect ventilation, and that if Dundee may be fairly regarded as an example of a British town, then certainly our schools are most imperfectly ventilated; and that for improvement in this respect the advantage of mechanical ventilation should be strongly insisted upon.

SUBSIDENCES OF BUILDINGS IN MINING DISTRICTS.

THE subsidence of buildings caused by underground workings is becoming quite common of late, owing to the necessity of removing the material which formerly was used to give support. Some intricate questions of law are involved in the disturbances. The paper which was read at the meeting of the British Association by Professor Benton had for its object the minimising of the amount of compensation which owners of mines have to pay to the owners of houses which are injured through settlements. It was asserted by the Professor that it was obviously impossible with the annual output in Great Britain of about 160,000,000 tons of coal to avoid surface subsidence. The subsidence might cause permanent injury to buildings by destroying their verticality. These damages might result not only from the removal of the subjacent mineral, but also from the removal of the adjacent mineral. After dealing with the common law of the country with regard to damage to property by mining operations, the author explained that in order to avoid such damage direct and lateral support was given to the surface by leaving considerable areas of coal unwrought. A small building standing in an area 20 yards square might require for its support a pillar of coal of 390 yards square and 6 feet thick, weighing about 180,000 tons. This weight of coal would provide lateral support for one seam only. In working four other seams of similar depth and thickness near the same building a total of weight of more than 720,000 tons of coal might be left unwrought. If it be borne in mind that there were between 2,000 and 3,000 distinct colliery enterprises in this country, it might be safely inferred that much coal was annually left unwrought for the lateral support of the surface. This coal was sacrificed for ever, and was a loss to the owner and the lessee of the coal, and also to the nation. The author then proceeded to point out the circumstances which govern the amount of lateral support given under the various conditions of coal-mining so as to avoid on the one hand leaving too much mineral, whereby the waste of individual and national wealth is incurred, or, on the other hand, leaving too little support, whereby a double penalty is incurred by the mine-owner. He considered that some alteration was needed in the common law with regard to the matter, for the sake of equity and economy. Equity, because both mineral and building property should have equal protection, whereas at present the mineral interests were sacrificed for the protection of the building interests. This preferential protection was moreover abused in a variety of ways. For instance, all fractures of buildings due to defects in foundations and construction were attributed to mining operations in the locality, for which compensation was obtained. No compensation was allowed to the mine-owner for mineral left for lateral support. He pointed

out certain alterations in the law, suggesting that a building should be banded with iron during the subsidence, and the actual damage afterwards assessed by the Crown Authority. By the creation of some such statutory provision buildings would be saved from much damage, their owners compensated for real damages, mining interests would be less hampered, and the nation enriched to the extent of the mineral rescued.

Professor Hull said that anything which tended to economise coal should be encouraged. In the neighbourhood of Birmingham large quantities of coal were destroyed by floods and by being reserved for such purposes as lateral support. Therefore the public as well as the mining interest should welcome any proposal that tended to lessen the amount of coal left in the mine, and which could not afterwards be recovered, or if recovered, was in a damaged condition.

THE ORNAMENTATION OF RUNIC CROSSES.

ACCORDING to the paper which Professor Boyd Dawkins read before the anthropological section of the British Association, it is an error to suppose that what is known as Celtic ornament is purely Celtic. It was very generally assumed by archæologists that the early Irish MSS., the Book of Kells, and the illuminated gospels of St. Cuthbert and St. Chad were of pure Irish art, and that consequently the interlacing "rope" or "basket" work pattern was distinctly Irish and Celtic. It was, however, an assumption which might readily be disposed of by an appeal to the designs on ornaments and monuments in the British Isles and in France, Scandinavia, and Germany. These the Professor considered under two heads, viz., the scroll, spiral, and flamboyant work, consisting of graceful combinations of curves; and, secondly, the interlacing work, more or less square and angular, the "rope" or "basket." The first of these two styles first appeared in the British Isles, Scandinavia, France, and Germany in infinitely remote prehistoric times, in the Bronze Age, and subsequently became more and more elaborate in the prehistoric Iron Age, constituting the "late Celtic cut" of Mr. Franks. This art was probably ultimately derived from the centres of civilisation in Southern Europe, principally Greek and Etruscan, and had been proved to have been introduced into France from Italy. From its prevalence among the Celts of the British Isles and of France, it was justly termed Celtic. The interlacing pattern of cross, too, was conspicuous by its absence from Irish art until the days of early Irish Christianity. It might be traced far and wide over Europe, and among nations who owed nothing to Irish art. From certain facts, it might be concluded that it was distinctly Germanic and not Celtic, and still less "pure Irish." The assimilation of the Celtic, graceful, spiral, and flamboyant, with the German design, not only in the early Irish manuscripts, but in Irish chalices and ornaments, might readily be accounted for by the influence of the Germanic tribes (including Scandinavians), not only in Ireland in the eighth and following centuries, but in those parts of Europe traversed by the Irish missionary. The conclusion to which he arrived was that the Irish illuminated manuscripts could not be taken as the tests of pure Irish, or even of Celtic art, but that a large part of the ornament was due to contact with Germanic art.

LEAD PIPES.

A REPORT was read by Dr. Tidy, at the meeting of the British Association, on "The Action of Drinking Water on Lead." It had been prepared by him in co-operation with Dr. Odling and Mr. Crookes. The following were the conclusions of the authors:—

"1. We deem it impracticable, even were it advisable, which we doubt, to replace the lead pipes by iron pipes, or by pipes of tinned lead. And even supposing we were able to suggest some protective coating for the lead pipes, it would be a huge undertaking and entail a heavy expense to take up hundreds of miles of lead pipe already laid and to replace them by pipes of improved construction. As regards tinned lead pipe, the tinning is found to be not only detrimental to the strength of the lead, but is likely, unless the coating be perfect, to assist the dissolution of the lead. Iron pipes, although strong, and safe so far as health is concerned, are more likely to break, more difficult to adjust and repair, very easy of oxidation, and liable to obstruction from accumulation of the oxide. We are not able to say how far some of these evils might be met by lining the service pipes with Angus Smith's or other innoxious material, such as a silicious glazing. Tin also is acted upon by water, although no doubt its toxic action is far below that of lead. It is fairly flexible, but four times as expensive as lead. Being, however, a more tenacious metal than lead, a thinner tin pipe would suffice. But there is reason to believe that waters do not afford a protective coating to tin in the same manner that they habitually do to lead. The advantages of lead service pipes are their cheapness, durability, flexibility, and the ease with which they can be wrought out and repaired. 2. We consider that our results, as set forth in the pages of this report, warrant us in recommending with confidence the systematic and continuous filtration of the water, recourse being had to such modifications of the ordinary filter-bed as will insure the efficient silication of the water. Efficient silication would, in our belief, minimise to the utmost, and practically altogether prevent the action of the water on the lead services, thereby effecting a real hygienic improvement, and allaying the justifiable apprehension of consumers as to the possibility even of injury resulting to them from the lead-dissolving character of the water supply. Such filtration would, moreover, in a special manner improve the brightness and colour of the water, and would lessen the quantity of organic matter held in solution."

Mr. A. H. Allen (Sheffield Borough Analyst) congratulated the authors of the report on having come to definite conclusions. In Sheffield many persons had suffered from lead poisoning, and he was glad that the authors of the report had provided a remedy.

Dr. Leeds said that organic matter in soft water had a considerable effect in dissolving lead.

Dr. Odling suggested that the carbonic acid in the metal itself was an important element. The question of lead pipes was raised when it was proposed to supply Glasgow from Loch Katrine. But the fact was that soft water soon ceased to act upon lead.

CORRESPONDENCE

Society of Architects' Visit to the Indian and Colonial Exhibition.

SIR,—Will you allow me to inform your readers that the visit paid to the exhibition on Saturday last was one of great interest to members of the society, who gathered many valuable ideas regarding our Colonial and Indian materials and workmanship. The visit will be repeated on Saturday, the 18th inst., when, by the kind permission of the Royal Commissioners, Mr. C. Purdon Clarke will conduct the visit, and show the closed portions of the Indian palace and other objects of interest not otherwise available to the public. Owing to the crowded state of the exhibition on Saturday, it has been found desirable to meet in the main entrance at 9 A.M., but as notices have been issued for members to meet at 3 P.M., a second visit will be held at that hour as well. May I, further, say that all architects, whether members of the society or not, will be gladly welcomed, especially at the 9 A.M. visit, and if they will bring their sketch-books, I am sure they will not regret a visit. There is a vast amount of information to be gathered from this exhibition. Your obedient servant,

HUGH ROUMIEU GOUGH,
President of Society of Architects.

12 Carlton Chambers, Regent Street, S.W.:
September 7, 1886.

Carisbrooke Castle.

SIR,—I should like to draw the attention of the Crown officials to the state of Carisbrooke Castle, Isle of Wight. It is so entirely surrounded by trees and covered with ivy that nothing can be seen from the outside but a bank of green leaves. The Princess Elizabeth's apartments are discreditable to official conservation. It is true the governor of the castle provides a book for visitors who wish to hand down their names to posterity; but the chief necessity for its existence is in the fact that every inch of wall is already covered with the patronymics of uninteresting nobodies.—Yours obediently,

16 Austin Friars, E.C. HENRY OUGH.

Corporation of Nottingham.

SIR,—Will you please insert in your next Friday's issue of *The Architect* the fact that the Corporation of Nottingham's sixth annual autumn exhibition of modern pictures at the Art Gallery, Nottingham Castle, will open to the public on Saturday next, September 11, the private view being on Friday, Sept. 10. The President and Council of the Royal Academy contribute *Napoleon on Board the "Bellerophon,"* by W. Q. Orchardson, and many other important works are in the exhibition.—Yours obediently, G. H. WALLIS, Director and Curator.

Midland Counties Art Museum,
The Castle, Nottingham: Sept. 6, 1886.

SCHOOL BUILDINGS.

Bradford.—The Fairweather Green school, erected by the Bradford School Board, has been opened. The style of the building is Domestic Gothic. The cost of the buildings and furnishing has been 9,224*l.*, making with cost of site (2,083*l.*) a total per head for the 1,003 children accommodated of 9*l.* 3*s.* 11*d.* The following were the contractors :—Masons and joiners, Messrs. John Moulson & Son ; plasterer, Mr. S. Sunderland ; plumber, Mr. Alfred Higginbotham ; slater, Mr. James Smithies ; painter, Mr. D. E. Hutton. The heating apparatus has been supplied by Messrs. Walton and Brear. Mr. Peterson is the architect.

Falkirk.—The old parish school has been opened after alterations as a high school for the Falkirk School Board. The conversion of the building has been carried out from the plans of Mr. Wm. Black, architect, Falkirk.

Halifax.—The memorial-stones of a Wesleyan school chapel at Caddy Field, Halifax, have been laid. The building has been designed by Mr. James Farrar, of Halifax, the style adopted being Gothic.

Wednesbury.—The memorial-stones of the new wing of the Wesleyan schools at Spring Head have been laid. The extensions will take the form of six new classrooms, teachers' room, and an extension of the upper schoolroom. Mr. A. Lynex, of Walsall, is the builder, and Mr. C. H. Newman, of Wednesbury, the architect.

CHURCH BUILDING AND RESTORATION.

Durham.—The new Congregational church, designed and superintended by Mr. H. T. Gradon, architect, of Durham, was opened on Wednesday, September 1. It has been erected at a cost of about 3,500*l.*, and has accommodation for over 500 people. Messrs. Geo. Gradon & Son, of Durham, were the contractors.

Dumbarton.—The foundation-stone of a United Presbyterian church has been laid. The building is designed by Mr. John M'Leod, architect, of Glasgow and Dumbarton.

Farnborough.—The chancel of the parish church of Farnborough, Hants, has recently been entirely rebuilt, from designs and under the superintendence of Mr. A. R. Barker, architect and diocesan surveyor, of 11 Buckingham Street, Strand, the contractor being Mr. Smith, of Farnborough.

Glasgow.—The foundation-stone of the Queen's Park Baptist Chapel has been laid. The style of the building is Romanesque, with some introduction of Transitional detail. The architects are Messrs. M'Kissock & Rowan, of Glasgow.

Gildersome.—The memorial-stones of a Wesleyan chapel have been laid. The building is being erected from the plans of Mr. T. A. Buttery, architect, of Morley.

Hanley.—The Methodist chapel has been reopened after considerable internal alterations. The whole of the works have been satisfactorily carried out by Mr. Cornes, of Hanley, and the painting and decoration by Messrs. Greenwood Bros., of Leeds, under the superintendence of Mr. William Hill, architect, of Leeds, and involving a total outlay of about 2,300*l.*

Mansfield.—A Primitive Methodist chapel, built from the plans and under the direction of Mr. R. Frank Vallance, architect, of Mansfield, has been opened. The walls are of Mansfield Woodhouse limestone, rock faced, and Matlock stone has been used for the dressing of the building, the style being Gothic.

Strathpeffer.—A new church, erected on an elevated site immediately above the pump-room at Strathpeffer, has been opened. The building, which is in the early Gothic style, is designed to accommodate between 600 and 800 people. Mr. Joass, Dingwall, is the architect.

Tunbridge Wells.—The dedication-stone was laid by Mrs. Weare, on Monday last, of the new Church Mission Room, High Brooms, Tunbridge Wells. This building is now in course of erection from the designs of Mr. Brett A. Elphicke, of London and Tunbridge Wells.

Whitby.—The corner-stone of the church being erected on the West Cliff has been laid. The estimated cost of the building, the style of which is fourteenth-century Gothic, is about 10,000*l.* Mr. Robert J. Johnson, F.S.A., of Newcastle-on-Tyne, is the architect, and Messrs. Padbury & Son, Scarborough, are the builders and contractors. Mr. Dean is clerk of works.

Wolverhampton.—The memorial-stone of the new chancel to Christ Church has been laid. The contractors for the work are Messrs. G. & F. Higham, who built the church, and the architect is Mr. T. H. Fleeming, all of Wolverhampton.

REVIEWS.

THE CONSTRUCTION OF SILOS. By THOMAS POTTER. London : B. T. Batsford.

Few processes in farming have excited more interest in a short time than the conversion of green stuff into silage. At first it was supposed to be a new discovery, but the process is now said to be a very ancient experiment in agricultural chemistry. Everyone has his pet scheme of producing the fermentation of the stuff by applying weights, and there is an advantage in having so many experts taking an interest in the process. Mr. Potter has built silos, and from his position he was bound to examine many varieties of them. In the little book which he has lately published he gives a fair description of the principal systems. He is not prejudiced in favour of his own or any other way of producing ensilage. Throughout Mr. Potter takes the builder's point of view, and in describing constructive modes he is sufficiently precise about dimensions, materials and cost of work. Although so many silos exist, there is apparently an opening for a more perfect one, and, indeed, some farmers think that a better result is obtainable from a stack built up in the open air, and which is compressed from time to time by winding a number of wire ropes that cross the mass. The book is addressed primarily to builders, but it is no less useful to farmers. Amateur agriculturists of a scientific turn, and with money to experiment, will find it fascinating reading.

GENERAL.

Sir John Savile Lumley, British Ambassador at Rome, has offered to the Nottingham Castle Art Museum a collection of specimens of classical antiquity which he found on the site of the Temple of Diana, near Rome. The collection comprises a large number of objects and fragments in terra-cotta, bronze, and marble, as well as specimens of money inscriptions. The Nottingham Town Council have accepted the offer.

The Associates' Sketching Club of the Leeds and Yorkshire Architectural Society held a monthly meeting on Monday evening, when the sketches produced by the members during the month were exhibited. Amongst the best are Mr. Alf. Whitehead's *Entrance to Chapter House*, *York Minster*, and *Kiddal Hall*, near Leeds ; Mr. F. W. Bedford's *Interior*, *Chester Cathedral*, and *Benthall Hall*, Salop.

Mr. Howard Thomas has received a commission for a statue of the late Mr. Samuel Morley to be erected in Bristol.

Mr. G. Cox, of Birmingham, has obtained the first prize in competition for new schools to be built at Harborne. Mr. D. Arkell, of Birmingham, obtained the second prize.

A Carved oak church interior has been sold by Messrs. W. & F. C. Bonham, auctioneers, for the sum of 2,900*l.* Its destination is King's College, Cambridge.

The Edinburgh Exhibition having been assessed at 17,500*l.* for rating purposes, the executive has objected, and plead that if the principle of assessment on the rental was admitted, they would also become liable to the Income-tax Commissioners for taxation on profits.

Mr. Richard Davis, Lord-Lieutenant of Anglesey, and late member of Parliament for the county, has announced his intention of erecting a new chapel at Menai Bridge, at a cost of 4,300*l.*

Mr. T. E. Smith, of Bolton, has prepared designs for a new hotel at Horwich in the old English post and plaster fashion, with overhanging gables and balconies.

Mr. W. Emden is preparing plans for a new theatre which Mr. E. Terry, the comedian, proposes to erect.

A Bazaar held last week in aid of the Alyth Town Hall building fund reached in the total drawings a sum of 1,021*l.*

The German Government have declined to subsidise the holding of a national Exhibition of Industry at Berlin in 1888, and the scheme will now fall to the ground. The reason assigned is the negative attitude of a very large class of those who are concerned in industrial pursuits.

A Hall is to be erected in Bridgwater at a cost of 4,000*l.*, as a memorial of Mr. George Williams, the founder of the Young Men's Christian Association.

The Drainage Works in progress in the Houses of Parliament are to be completed on October 31.

The Glasgow Town Council have agreed to expend 600*l.* in the purchase of articles from the Indian and Colonial Exhibition.

Two Pottery Kilns of the late Roman period have been found, with fragments of Samian and other ware, during the course of levelling the ground for the new Corporation sewage works on West Stow Heath, near Bury St. Edmunds.

The Architect.

THE WEEK.

The case of the new Admiralty and War Offices seems as far as ever from settlement. On Monday the First Commissioner of Works was asked to explain how it was that a sum on account of the work had been entered in the Estimates but was afterwards withdrawn. Mr. Plunket said that during the last Parliament a suggestion was made by Mr. W. H. Smith, the present Secretary for War, that a Committee should be appointed to reconsider the plans. The suggestion was approved by the Liberal Government. It was afterwards proposed that a Committee should be appointed for the purpose of reconsidering the whole question; and a Committee was proposed and nominated with the assent of the House. It had been stated in reply to questions in both Houses that nothing would be done beyond what was absolutely necessary in the way of demolition until Parliament had had an opportunity of reconsidering the matter. In these circumstances he considered it would not be proper to proceed with the vote. According to Mr. Plunket, it was, moreover, the intention of the Government to bring the subject before the House as early as possible next session. That session will need to be elastic if all the work that is assigned to it can be performed within the time. It is not advisable to be precipitate, but the present Government would add to their reputation by settling this affair. The architects are entitled to commiseration for having to endure so long a period of uncertainty.

The official announcement of the medals awarded to English artists for their contributions to the Berlin Exhibition has appeared. Grand gold medals have been gained by Sir John E. Millais, Mr. Herkomer, and Mr. Ouless. A special medal for "Science" has been awarded to Sir Frederick Leighton. Mr. W. B. Richmond and Mr. J. R. Reid have obtained small gold medals, and there is honourable mention of the works of Mr. F. Goodall and Mr. W. F. Yeames. In sculpture, Mr. Thornycroft and Mr. A. Gilbert are awarded small gold medals, and Mr. George Simonds an honourable mention.

During the last six months good progress has been made with the works of the new Tay Viaduct. The whole of the foundations have been completed, and they have all been tested with satisfactory results. The brickwork and masonry are nearly completed. The ironwork of all the girders has been fitted and drilled. Thirty of the spans have been erected, and the decking has been fixed upon them. The ironwork of all the pier shafts or superstructures has been prepared, and 57 have been erected. Of the large girders (245 to 227 feet spans) eight pair out of thirteen have been floated off; two more pair are nearly ready for floating off, leaving only three to be done.

Many of our readers will hear with regret of the death of Rowland Mason Ordish. There were few men more closely associated with the history of iron construction in our time. He was one of the principal assistants to the late Sir Charles Fox when working out the details of the ironwork of the Great Exhibition building of 1851, for Sir Joseph Paxton contributed simply a general plan, and was incompetent to deal with construction on so large a scale. The application of wrought iron for bridges had been demonstrated by Stephenson and Fairbairn, but developments were introduced by Mr. Ordish. He patented a system of rigid suspension bridges which was applicable to large spans and to railway traffic. One example, at Prague, was illustrated in the first number of *The Architect*. For it the Emperor of Austria awarded to Mr. Ordish the large gold medal. The Albert Suspension Bridge at Chelsea is also on the principle, and bridges designed by Mr. Ordish are to be found in many parts of the world. Several large roofs for exhibition buildings, markets, and stations were constructed under his direction. The roof of the hall of the Albert Palace at Battersea is taken from the Winter Palace in Dublin, of which Mr. Ordish was the designer. His aid was also sought in the preparation of the plans for the great roof at St. Pancras, the roof at St. Enoch Station, Glasgow, and the Albert Hall; indeed, in al questions relating to iron construction his opinion was accepted as authoritative. He came to the rescue of Captain Fowke in preserving the domes of the Exhibition building of 1862 from collapse. All the large books on ironwork comprise some of his designs. For a time Mr. Ordish was in partnership with Mr. Lefeuvre. He was also a president of the Society of Engineers. Of late years he was engaged by Messrs. Dennett & Ingle, in whose London offices he aided in solving many intricate problems. He was superintending the fixing of some of their ironwork up to Saturday evening. On Sunday he died suddenly. He was sixty-two years of age. Mr. Ordish was distinguished among engineers in giving an architectural character to his work. He always insisted on the necessity of co-operation among architects and engineers, and wrote articles on the subject in this journal. In both professions there will be mourners for his loss.

According to a correspondent of the *Standard*, in the excavations undertaken by the Greek Archæological Society on the Acropolis of Mycenæ portions of a building, which is supposed to be the palace of the Atrides, have been laid bare. Three passages lead to a court, in which there were traces of buildings of more recent date. Behind this was a hall, in the middle of which was a hearth, the whole agreeing with the Homeric descriptions. Near the hall were two small rooms, communicating with one another. The architecture is similar to that discovered at Tiryns.

The competition for the Fine Art Gallery at Leeds, which is to cost 8,000*l*., was limited to the architects of the town, and, since able architects are to be found there, it cannot be said that the ratepayers were likely to suffer by the arrangement. The Free Library Committee are dissatisfied, and have come to the following resolution:—"That in the opinion of this Committee the condition imposed by the Special Fine Art Gallery Committee, restricting competition plans for the erection of a gallery to architects practising in Leeds, is unwise and contrary to the principle of free and open competition hitherto adopted by the Leeds Corporation, and this committee is also of opinion that the Special Committee ought at once to remove the restriction adopted." It is possible that the resolution was inspired by a little jealousy. The Free Library Committee may have thought that the arrangements belonged to them, and there was no need for the formation of a new body. Whatever is the cause of the ill-will, we trust the arrangements will not be altered.

The extract from the despatch received from the Chargé d'Affaires at Dresden which is printed by the Board of Trade will be read with interest, for it is another illustration of the maxim that in the mishaps of our best friends we can find something to console us. Mr. Strachey, writing of the iron trade in Germany, says:—"My informant said that, taking the metal all round, from pigs and ingots to steam-engines and penknives, the situation here was disastrous. The only consolatory circumstance was that, thanks to the protective tariff, which kept up some slight pressure against foreign commodities, the outlook of the iron-masters and machinists of Germany was not quite so black as that of their British rivals. My informant proceeded to ascribe this slackness to over-production. I asked how over-production was to be defined. Did it mean that the blast furnaces of Silesia and Westphalia were surrounded by mountains of unsaleable crude iron, and that Chemnitz had no dealings in locomotives and looms? Or was over-production only the capitalist's term for very low profits? He added that there was a positive material glut of the articles which are made for stock. For instance, the crude iron in hand at the blast furnaces was normally 1-24th of the annual output, whereas the actual surplus was double that proportion, or about 1-12th of the output. There was a similar augmentation of the visible supply in other iron-making countries, so that the aggregate output was in excess of the requirements of the market." German trade has been conducted in so surprising a way since the war with France that disasters of the kind described in the report are inevitable.

FRA BARTOLOMMEO DELLA PORTA.*

IN spite of the prejudice which is excited by the Order from association with the Inquisition, the Dominicans merit grateful remembrance for their encouragement of art in all its forms. Among the members have been architects like Giovanni da Campi and Jacopo Talenti, who completed Sta. Maria Novella in Florence; Giovanni Giocondo, whose fame was known throughout Europe as an authority on military and civil construction; Francesca Colonna, the author of the architectural romance, "The Dream of Polifilo"; Ignatius Danti, who built part of the Vatican; Domenico Paganelli, who planned the great fountain at Faenza; Vincenzo Maculano, who fortified Genoa, and was the only architect of whom it can be said that he was within one vote of the Papal throne; Francesco Romain, who was king's architect in France; and others. There have also been sculptors in stone and bronze, workers in intarsia, glass painters, and engravers. The painters were the most numerous, and the greatest of them were Guido of Vecchio, known as Fra Giovanni of Fiesole, and more generally as Fra Angelico; and Baccio della Porta, known as Fra Bartolommeo.

Fra Angelico was one of those men who seem like stray spirits that have somehow been wafted to this troubled world, and pine for the time when they are to escape from it. His pictures stand apart from all others, for his figures have as little of the earthly about them as he had. The forms may have some resemblance to mankind, but they are embodied spirits rather than mortal beings. "The saints that he painted," says Vasari, "have more of the air and resemblance of saints than any other painter," and if so, it is because they are reflections of the gentle spirit of the man who produced them, and who was exempt from all the influences of passion and care.

He was not an artist who can be "understanded of the people." Fra Angelico kept aloof from the turmoil of life, and lived among idealities. It was his maxim that to be a painter a man should live in quiet, and be free from anxiety. There are few painters who would not agree with him, but destiny is less favourable to them than to the Dominican.

Delaroche suggested the separation between Fra Angelico and the painters who are born to suffer like their fellow-men, when in the *Hemicycle* he represented the monk with his back to the students. What could be their victories or their ambitions to his soul? But near him is another Dominican, who contemplates the scene with a sympathetic look. He had known a little of what a painter has to endure, for this artist who is seen standing between Da Vinci and Raphael is Fra Bartolommeo di San Marco. Unlike so many of the men near him, there is nothing in his homely face to suggest aristocracy of birth or intellect. But he is the sort of man to whom one might go for advice in a difficulty, or who could be asked without fear of offending to come and look at a picture in progress, and even if it were not easily reached.

It is satisfactory to find that a life of Fra Bartolommeo has appeared early in the series of the "Artistes Célèbres," for the publication is evidence that the conductors have no fear of temporary prejudice. At the present time there is a disposition among many in France to imagine that an artist who lived and painted within a convent cannot have a high standing, and more popularity would be gained by a book which corresponded with the prevalent belief. As in other cases of the series, the author, M. Gustave Gruyer, has an esteem for his subject, and he is not to be debarred from expressing it. He has investigated the authorities, and by a comparison is able to do something towards a complete memoir. Two writers, viz., Vasari and Padre Marchese, furnish the chief sources of information, but something has been added by later inquirers, and the examination of the artist's works by Messrs. Crowe and Cavalcaselle, and other critics, throws a light on questions of dual authorship. For it is worth remembering that for a part of his life Fra Bartolommeo worked with one or more partners.

According to Vasari's account (which was written about fifty years after the artist's death) Bartolommeo was a native of Savignano, a village ten miles distant from Florence. In what year he was born is not stated, and nothing is said about his family. Subsequently it was discovered that the time was 1469. Padre Marchese says that Bartolommeo was the son of a peasant proprietor, who was called Paolo del Fattorino because the nickname was given to his father, who was useful as a factor or agent to his neighbours. Apparently Paolo gave precedence to his own interests, and contrived to buy a house in Florence near one of the city gates. In consequence, a new sobriquet was applied to his son, the artist. He was known, prior to joining the Dominicans, as Bartolommeo or Baccio della Porta. The family history is differently stated in M. Gruyer's biography. According to it Paolo was in the service of one Fattorino as a mule-driver, and his employer's name was applied to him. At last he was fortunate in marrying a widow who lived near the Gate San Pier Gattolini, and afterwards he bought a house in the same place. The accounts differ in detail, but it is clear from them that Bartolommeo came from a humble class, and he was called Della Porta for want of a more precise surname.

He was not ashamed of his origin, and the homeliness and simplicity which are found in his pictures suggest the peasant's son. When he was renowned he is said to have visited Savignano, and to have made himself known to some of his humble relatives. Nor are we to think any the less of Bartolommeo because he announced to them that the King of France had sent for him in order to paint pictures in a palace. He had his weaknesses, but they were of a kind that were easily pardoned, and Bartolommeo would be less interesting without them.

In what way he displayed an aptitude for painting remains untold, but on the advice of Benedetto da Majano, the sculptor, Bartolommeo, in his ninth year was apprenticed to Cosimo Rosselli, who could hardly be called one of the great artists of Florence. M. Gruyer says he was an excellent master, and had not at that time undertaken the experiments in alchemy on which he squandered all his wealth. Padre Marchese, on the other hand, doubts whether the advice of Benedetto was honestly given, as Cosimo was the least distinguished of the Florentine painters, and was remarkable only for poverty of design. In the atelier, Bartolommeo found two young artists at work. One was Pietro da Cosimo, the weird painter who is introduced by George Eliot in "Romola." There was nothing in common between him and Bartolommeo. With the second, who was called Mariotto Albertinelli, he soon became a friend, and afterwards a partner.

Florence at that period was divided into two parties. One was fond of playing with paganism. Venus to them was not only the goddess of beauty, but of culture and liberty. It was the policy of the Medici to encourage the Florentines to believe that they patronised art and literature, because they were eager to free the citizens from the restraints imposed by narrow-minded spiritual and temporal lawgivers. The people who wished to be thought advanced in their ideas did their best to please the Medici, by attempting to live according to Classic ways. There were out-of-door pageants got up to charm all classes, feasts where the guests were crowned with roses, festivals in honour of the immortal gods. It was hardly surprising that artists who had studied the Greco-Roman marbles in the garden of the Medici should be subjected to the new influences, and end by thinking that it would be well to make forms more agreeable to the eyes than those of confessors and martyrs. The gods and goddesses of Olympus were accordingly utilised for Christian art, to the great delight of some ecclesiastics who took a broad view of life, and sought for renown in piquant stories, also of the Classic kind, rather than in sermon writing.

But there was also a party among whom old-fashioned notions prevailed. They distrusted alike a make-believe Classicism and a real tyranny under the form of Medicean enlightenment. They were led by the Dominican Savonarola. With keen insight he saw how artists were made the tools of craftier men in order to corrupt the Florentines, and his most impassioned appeals were to them. Bartolommeo, as we might expect from the cut of his

* *Les Artistes Célèbres: Fra Bartolommeo della Porta et Mariotto Albertinelli.* Par Gustave Gruyer. Paris: J. Rouam. London: Gilbert Wood & Co.

features, as they are represented in the old woodcut of Vasari, belonged to the party of Savonarola; his friend, Albertinelli, adhered to the side of Medici and liberty.

When an attack was anticipated on Savonarola's convent, Bartolommeo was among the Piagnoni who volunteered to defend the building. He appears to have exercised self-control as long as the enemies were outside. But when the Arrabbiati were seen to scale the walls he became panic-stricken, and in his terror made a vow that if he escaped in safety he would become a monk. As soon as Savonarola surrendered to his enemies, the contest ceased, and Bartolommeo was free; but in his extreme sensitiveness he felt that, with more bravery on his part, the great friar might have been saved.

Like other artists who were of the same party, he fled from Florence, and in July 1500 he fulfilled his vow by entering the Dominican Order at Prato. He was then twenty-five. Bartolommeo's abandonment of the world seemed like a catastrophe to Albertinelli. We are told by Vasari that he was desperate at the loss, life became a burden to him, and, if it had not been for his life-long aversion to monks, he would have entered a convent in order to be near his partner. The two artists painted so much alike that it was difficult to discriminate between them. The unfinished *Last Judgment* in the chapel of the cemetery of S. Maria Nuova, which was left in an unfinished state by Bartolommeo, was therefore entrusted to his friend.

It is likely that on embracing the monastic life Bartolommeo believed he had done with painting. This seems evident from a transaction which arose respecting a younger brother. He also was to become a painter, and Bartolommeo, who was his legal guardian, apprenticed him to Albertinelli, and assigned him his own share of the farm. A copy of the curious indenture which was signed on the occasion was printed in *The Architect* of January 24, 1885. It is evident that if Fra Bartolommeo intended to resume painting, he would have kept his brother under him instead of entrusting him to an artist of a flighty disposition.

It is difficult to speak with certainty of the characteristics of the works of his first period. Most of them exist no longer. Bartolommeo was one of the artists who cast his paintings of secular subjects into the huge pile of worldly things that was lighted at the dictation of Savonarola. According to the Padre Marchese, there was timidity in his first manner, his outlines were harsh, and his perspective uncertain, but skill was seen in his draperies and colouring. The work which is sure of perennial interest is the portrait in profile of Savonarola.

The Ages of Faith could not have come to an end in Vasari's days, for we find him expressing the belief that whenever Nature creates an artist of retired habits, she is careful also to provide for him the means that are requisite for a quiet life. Her ladyship is not always so bountiful to modern artists, but her arrangements for Fra Bartolommeo were marked by foresight. An atelier within a convent seemed as well suited for his work as for Fra Angelico's. When, after the lapse of four or five years, he yielded to the persuasion of the Prior and took up the pencil, it was evident that his power had not departed. The first picture that represents his new state of life is *The Vision of St. Bernard*, which was painted as an altar-piece, but is now in the Florentine Academy. M. Gruyer prefers the similar work by Filippino, and there is some hardness in parts, but there is novelty in the arrangement by which the principal figures are seen in profile. Vasari, who knew the picture before the restorers were allowed to operate on it, gives it high praise.

The necessity of definite conditions, clearly expressed in writing, was suggested in this case. No price was stipulated when the picture was ordered by a layman. The painter received forty ducats for materials and expenses; he wanted 160 ducats more. The patron said eighty ducats were enough for the picture. A reduction of forty ducats was in vain made by the painter. It was proposed to submit the case to the Guild of Apothecaries, but the monks had little confidence in the tribunal. Then a common friend of the parties offered to arbitrate, and he valued the work at one hundred ducats, one-half the original price. A dispute also arose over another picture at a later date, the altar-piece of St. Romano, at Lucca, which is one of the artist's noblest works. In the upper part is God the Father, seated, surrounded by angels, and below are St. Mary Magdalene and St. Catherine. From its beauty Rio supposes that it must have been designed by Raphael. It was painted for the Dominicans of Murano, and the price was to be from seventy to one hundred ducats. A sum of twenty-eight ducats was paid on account. After the picture was finished two monks came to Florence to settle the balance. The painter asked fifty ducats, which they declined to give. They returned to Murano. After three years the Florentine monks sent a formal notice, which might have been written yesterday, to their brother Dominicans, stating that if the money was not paid within ten days the picture must be sold and the instalment forfeited. The painting was afterwards presented to Fra Pagnini by the artist, who in turn gave it to Lucca. That city also possessed in San Romano the *Mater Misericordia*, which Canova classed, with Titian's *Assumption*, as the two greatest Italian works. In the cathedral is the *Virgin of the Sanctuary*, with the wonderful singing angel seated on the step. It now has its pristine brilliancy, but when Richardson saw it he says it had turned black and was spoiled. The transaction with the monks of Murano suggests that convents of the same Order were in such matters as picture dealing independent of each other. Fra Bartolommeo seems to have found no trouble in dealing with patrons for the remaining pictures he produced.

An element of risk that might have ended in litigation was, however, introduced when a partnership was sanctioned between the friar and his former associate, Albertinelli. There was a precedent for it in the case of Fra Angelico and Benozzo Gozzoli. But Benozzo was a man who was happiest when among monks, while Albertinelli had an aversion to all of them, with the sole exception of his friend. The partnership lasted three years. On its dissolution there was a division of the contents of the studio. Pictures of the value of forty-eight ducats were retained in the convent, while Albertinelli's share amounted to forty-seven ducats. The model in wood of life-size, a second that was hinged, and a third of a child in plaster, together with a pair of iron compasses, were to continue with Fra Bartolommeo for his life, and on his death were to become the property of Albertinelli and his heirs.

There was a striking change in the quality of Fra Bartolommeo's works after he became a monk. Two causes have been assigned to explain his progression. The first is the presence of Da Vinci in Florence. He had fled from Milan. Vasari is silent about a meeting between the artists, but Padre Marchese seems to us to be justified in supposing that Fra Bartolommeo would seek to form a friendship with the leading master of the age, and gladly obey his precepts about chiaro-oscuro and colouring. The small fresco lunette over an entrance to the refectory in San Marco, representing the meeting at Emmaus, is said by some critics to be in the style of Da Vinci. But the strange witchery of that master's faces was never attempted by the Frate.

Another potent influence was found in the friendship of Raphael. After Da Vinci and Michel Angelo, the greatest artist living in Florence at the time of Raphael's visit to that city was Fra Bartolommeo. Now we know that Raphael was one of those men who always try to extract knowledge from everybody who is wiser than themselves. His brain might not be the largest, but it never was surpassed in assimilating power. There was a geniality and warmth about the pictures of Fra Bartolommeo in which his own imitations of Perugino were at that time deficient, and so he held on by the Dominican until he acquired a better style of colouring and modelling, and was able to recognise the beauty of figures of a less conventional type. In return, he was probably unable to teach Fra Bartolommeo anything new, but the conversations with Raphael could hardly fail to excite thoughts which had been forgotten from the time the monk had abandoned the world, and the innate grace of the Umbrian painter's slightest sketch must have been a new revelation to him. It is evident the friar was fascinated by Raphael, and afterwards he went to Rome in order to behold his great works in the Vatican. He was probably amazed at the unanticipated progress of an artist whom he could claim

as a pupil. For the bound which RAPHAEL made in painting was a puzzle to all. The younger RICHARDSON, who wrote early in the last century and embalmed many old traditions in his book, says that in style FRA BARTOLOMMEO was as great as RAPHAEL, while his painting was more vigorous and mellow. "He seems to have been the greater man," continues RICHARDSON, "and might have been the RAPHAEL had not fortune been determined in favour of the other."

FRA BARTOLOMMEO is said to have left Rome because he felt overpowered by the works which he saw in progress. Apparently he was not puffed up by an exaggerated estimate of his own powers. But, monk as he was, his humility was not proof against the allegation that he could only attempt draped figures. He therefore painted a *St. Sebastian* to give evidence of his capacity. VASARI, who saw the picture, says the flesh was like life, the form was beautiful, and the countenance captivating. But, while admired by artists, it was supposed to be dangerous to one class of spectators, and accordingly it was removed from the church to a chapter-house. Afterwards it was sold to the French king. The picture was long lost to sight. At one time it was supposed to be in the possession of M. THIERS. But it had found its way to Toulouse after the first Revolution, where it was sold to a M. ALAFFRE for 48 frs. His son gave an account of it in 1844 in the *Journal de Toulouse*. According to M. GRUYER, it is now possessed by M. CHARLES ALAFFRE, of Pézenas.

The figure is draped as modesty requires, and it cannot be worse than numerous representations of the same subject. But there seems to be a tradition in San Marco that the painter suffered remorse on account of it, and it was the last of his nude figures. Otherwise his life in the convent ran peacefully. The state of his mind may be inferred from a few lines he inscribed on the back of one of his drawings, and which are to the following effect :—

Supreme, eternal source of sweetness, welling
Life, light, and solace o'er this heart of mine ;
Full well I feel, when close beside Thee dwelling,
How joy itself, if Thou were not, must pine ;
How heavenly hymns must sink to fiendish yelling ;
How life must never live, but still decline.

Padre MARCHESE says the lines are by FRA BARTOLOMMEO, and are as valuable as one of his pictures. M. GRUYER says they were written by SAVONAROLA. At any rate, from his having copied them, they are suggestive of the feelings of the painter.

Yet it is evident he did not enjoy vigorous health. His visits to many convents were evidently journeys in search of strength. He was struck with paralysis while working in the Council Hall of Florence, where he took up a commission which had been intended for MICHEL ANGELO and DA VINCI. A fever followed, to which he succumbed in his forty-eighth year. The eulogy which one of his friends proposed to be placed under his portrait reveals what was thought of FRA BARTOLOMMEO by his contemporaries:—

In colouring, Apelles ; in design
I rivalled Buonarotti ; nay, surpassed
Even nature ; into all my forms I cast
Such strength, life, motion, flesh, bone, outward-shine.

FRA BARTOLOMMEO is one of the Italians who are not well represented by paintings in England, although Dr. WAAGEN considered the *Riposo* at Panshanger to be among the painter's chief works. In his drawings we are richer, if we count the collections of Mr. HESELTINE and Mr. MALCOLM, of Portalloch. They are, however, closed to the public. Under the circumstances, the proprietors of the Librairie de l'Art have conferred an additional favour on art students by introducing so many sketches of the painter's works in the careful and sympathetic memoir by M. GRUYER.

THE ACROPOLIS OF ATHENS.

IN the excavations now going on at the Acropolis of Athens the refuse stones and soil are thrown over the walls, and form long sloping lines of earth hiding the almost perpendicular rock. This is especially the case on the north and east sides. One great characteristic of the site of ancient Athens is that, owing to its rocky nature, it probably presents the same appearance now that it did thousands of years ago. We see at once why the isolated and precipitous rock would from the earliest times be selected as a city or citadel. It is a great pity that in the course of the useful and interesting excavations now carried on anything should be done to alter the natural features of the hill. Either in baskets or down an inclined plane the refuse soil might be conveyed to the foot of the Acropolis, and might then be used in forming a better road of approach.

THE ROYAL ACADEMY AND ARCHITECTURE.

IN a second letter to the *Times*, Mr. W. H. White writes :—I have refrained, in the expectation that "R.A." would challenge some of the statements contained in my letter which appeared on the 30th ult., from replying to Mr. Aitchison, A.R.A., whose communication, published in the *Times* on the 2nd inst., charges me with having omitted to explain that the Academicians delegate some of their duties in the matter of lectures to others, and with having been ambiguous in my remarks on the absence of all study of architectural composition and planning at the Royal Academy.

Now, there are doubtless outsiders who could deliver better lectures on architecture than any of the Academicians, except, perhaps, their illustrious President ; but does an Academic chair, which is allowed to remain vacant for five years, mean nothing more than a question of lectures? Surely a professor of architecture at the Royal Academy is a high officer of education, the chairman of his committee of "Visitors," the chief of the architectural school. There are, indisputably, landlords who confer a signal benefit on their country by living out of it, and many an incumbent has preached better sermons than the holder of the fat living who employed him, but such are exceptions. Where they have become the rule, the annals both of Church and State show that the community has suffered.

It is perfectly true, as Mr. Aitchison informs you, that members of the Academy serve in turn as "Visitors" in the architectural class, and that plans, elevations, and sections are there drawn by the students, the best of whom receive prizes. It is also true that the master of the class is an accomplished architect who has studied in Paris, and it is this gentleman who is my authority for a part of the statement the ambiguity of which has struck Mr. Aitchison. The master of the architectural class called attention two years ago to "the entire absence in England of any study of architectural composition." He said ("Transactions," R.I.B.A., 1883–84, p. 117) :—"The English student makes no sketch-design ; he begins at once with his 2-foot rule to put the exact size of every feature in the building without going one single step further in the study of design. He does not consider proportion or anything." Again, at page 131 of the same volume, this same gentleman declares that "in France they lay great stress on the study of plans, but when this study was attempted at the Royal Academy, Mr. Street found out that it was difficult to teach the pupils to draw large plans, and so he confined them to elevations." I implied in my letter that such indispensable studies had been neglected for many years, but it would be more exact to say that, since the foundation of the Royal Academy in 1769, they have never been really taught there. Until 1860 the Academy had no architectural class at all, and it was only in 1876 that the architect members, on the recommendation of the late Mr. Street, began to take duty as "Visitors" in the class. But have these experts time enough to discourse to the students on mathematics, descriptive geometry, stereotomy, physics, construction, building legislation, &c., all of which subjects are separately taught by different professors at the Ecole des Beaux-Arts, over and above the more agreeable themes of ornament, decorative composition, history and theory of architecture, æsthetics, &c., which are also taught in the Paris school?

Sir, the haphazard character of architectural education in this country is a great and widespread evil. It is impossible for me, holding the office of Secretary of the Royal Institute of British Architects, to say all that ought to be said on the subject, and it is only right to add, if you will so permit, that I am solely and individually responsible for the statements made both in this letter and in that which you were good enough to print on the 30th ult. The grounds on which I have ventured to address you are that, in 1884, I published, at some personal cost, the results of an inquiry into, among other things, the current methods of artistic control of public buildings in Paris and London. I then tried to show that in France the school, the academy, and the State work together for the national good. The academy is recruited from the school, and school and academy provide the State with men fit to design and erect the public monuments of the country. But here in England a very different condition of things exists. In no part of the Queen's dominions is there any institution, either public or private, which can be properly termed a school of architecture, and a wide gulf separates the State from the Royal Academy. The Chief Commissioner of Her Majesty's Works,

who is the largest practitioner of architecture in Europe, and who is now planting all over England, Wales, and Scotland public buildings designed in his offices, does not officially recruit his staff of surveyors and draughtsmen from among the premiated students of the Royal Academy, nor does the typical English gentleman in search of an architect intentionally select from among those who have taken honours there. But would it savour of protection, would it militate against the glorious principles of free trade, if they were encouraged to do so?

THE ROMAN WALL AND ITS BRIDGES.

A COMMITTEE of the Cumberland and Westmoreland Archæological Society, consisting of Mr. J. A. Cory, architect, Mr. Cartmell, Mr. R. S. Ferguson, and the Rev. T. Lees, was lately appointed to make excavations on the line of the Roman wall. The report was presented at the annual meeting which was held last week. After stating the preparations made in the way of marking out the line of the wall and vallums, and the roads and camps in Cumberland, and offering thanks to various gentlemen for their assistance in this respect, the report went on to add that with regard to likely places for excavation the committee considered it would be desirable to ascertain how the wall crossed the various rivers in Cumberland, and, if possible, to find the piers of the bridges. The Poltross Burn at the entrance into Cumberland; the Irthing, at Willowford; and the Eden, at Carlisle, seemed likely places to yield results. They thought also of tackling the great question of whether the Roman wall went round or over Burgh Marsh. They, however, found that their hands were full, and the problem still awaited solution. Permission was readily given by Mr. Howard to excavate at the Poltross Burn and at Willowford, but on viewing the latter place it was seen that the damage to grass crops would be too great, and the intention to excavate there was abandoned until a more convenient season. In the excavations at Poltross Burn, in the ravine through which it runs near to Gilsland station was discovered on the western bank a regular faced wall of about three courses of ashlar work, and a short distance from it was about five courses of a similar wall. On the eastern bank corresponding fragments of wall were found, thus showing that the Roman road, known afterwards as the Stane or Carel Gate, had crossed the Poltross by a deep cutting. On the east side this cutting ended on a platform of rock, which was higher than the corresponding one on the western side, so that the bridge itself (a wooden one) must have been on a steep slope. Such a bridge would require supports other than merely at its two ends, and in the bed of the stream close to the west side was a large stone, not of native rock, oval and much water-worn, which might have been the foundation of a pier; and on the east side was what appeared to be a pier artificially built. After giving a few facts about the wall at the Willowford, the report went on to give the results of the excavations at Carlisle, and proceeded to state, from the oldest maps the committee could find, it would appear that the channel of the river Eden had not changed much near to Hyssop Holme Well since the time of Queen Elizabeth. It was about this place where the Roman wall descended and ascended again to the high ground over the flats at Parham Beck, and in tracing the course of the wall over the alluvial flats of the Eden two trenches were cut in the Sauceries, in the angle between the Eden and the Caldew. The trenches were cut in échelon, each about 30 feet long, and at a depth of about 6 feet 6 inches the water came in. A depth of about 2 feet more was searched by iron bars, but there was no sign of foundations; not a chip of stone was to be found, though the gravel below the alluvial deposit was searched. The next point selected was a clay pit in the angle between the Caledonian and North British Railways, where tradition asserted the wall to have been found when the latter railway was made. They found the foundations of the wall at a depth of about 8 feet from the surface of the ground, resting upon the gravel below the alluvial soil. The stones of the wall had been taken away down to the very foundation, but one or two bits of ashlar still in position enabled them to get the width of the wall as 7 feet 9 inches. Their next trial was on the west of the Caledonian Railway, where they found the wall. Turning to the Stanwix side of the river, they dug a trench in the footpath on the top of the bank, and the forced earth in it gave them a section of the north ditch. They next started to dig in the small alluvial area close to Hyssop Holme Well, and dug three trenches of great depth (11 feet in one place) and length, but found no trace of the wall. A halfpenny of George II. and a few bits of broken stones were all they found. Nothing like foundations could be found in the gravel bed in the weir opposite Hyssop Holme Well, though some twenty squared stones were found, of undoubted Roman work. They were strewn about the bed of the weir, and might have rolled down from the cliff. They were of the ordinary size of the ashlar work of the Roman wall, but too small they imagined to have been used as foundations for the piers of the bridges. One more trench was dug on the top of Hyssop Holme Bank, near the verge of the cliff across the line of wall itself. The wall had here been so thoroughly despoiled of its stones as to have been turned into a sort of ditch, and then to have been filled up by made soil. This was curious, because at the back of the row of villas on the top of Hyssop Holme Bank it was found at the depth of 8 or 10 feet, and large pieces of concrete were taken up and conveyed to neighbouring gardens and rockeries. It passed diagonally across the gardens of two of these villas, and was there recognisable by richer soil. It was quite evident that where the wall existed in the alluvial flats of the river Eden it had been utilised as a quarry and plundered to its very foundations. They were rather inclined to think that the actual bridge across the Eden itself might have extended from a point west of the Caledonian Railway, where they lost sight of the foundations, to the foot of Hyssop Holme Bank, about one-third of a mile, giving a bridge of some fifty openings, if they took the opening of the bridge over the North Tyne as a scale. There was nothing improbable in this. The vast floods that frequently covered the alluvial flats of the Eden would sweep away any solid wall across the flats. The Romans must either have embanked the river in a narrow and deep channel by heavy earthworks, of which there was no evidence to be seen, or they must have had a bridge of some fifty openings. It had often been commented upon as curious that no mural camp existed between Castlesteads and Stanwix, a distance of eight miles. The reason, although never yet printed, was not difficult to give. The country north of the wall between these two points was in Roman times an impenetrable morass, part of which now survived and was well known as Scaleby Moss. At Hallstanes Bridge, just before entering Burgh-by-Sands, Mr. Mulcaster uncovered a pavement for their inspection, but it was not Roman. Mr. Mulcaster informed them that in the marshy ground near Burgh the foundations of the wall lay upon great beams of black oak, a fact which he had ascertained in some very deep draining.

THE FADING OF WATER-COLOURS.

THE controversy on the permanence of water-colour drawings has been mainly wanting in precision. Mr. William Simpson is the first artist who is able to describe an experimental test. Fifteen years ago he painted two sets of cards with washes of the pigments in general use—one set was exposed to light for that length of time. His conclusions are as follows:—

The experiment here reported certainly proves that water-colours are liable to fade—some colours more than others; but this is nothing new. The fugitive character of crimson lake was known, and no artist nowadays would paint the carnations of a lady's face with that colour, or the rose tints of a sunset; but I confess that I was not prepared for the colour vanishing entirely from the paper, as has been the case. Neither did I expect that indigo would fade to the shadow it has become, but then it has to be remembered that my test has been of the most trying kind.

Here is the list of colours, and it speaks for itself:—Yellow ochre—unchanged. Indian yellow—has faded considerably. Lemon yellow—is not perceptibly affected. Gamboge—has faded. Newman's permanent yellow—unchanged. Cadmium yellow—this has not faded, but has seemingly become of a browner tinge. Chrome yellow—faded considerably; the slip not exposed seems to have become more orange, but, unfortunately, I had not noted at the time which chrome had been used. Brown pink—has faded, but it has stood better than might have been expected from its reputation. Emerald green—scarcely changed. Burnt sienna—unchanged. Vandyke brown—unchanged. Sepia—this shows a very slight tendency to fade. Roman sepia—this may have faded also, but, like the common sepia, the change is not very perceptible. Burnt umber — unchanged. Bistre — unchanged. Brown madder—this colour has lost a little of its redness. Light red—unchanged. Vermilion—shows no change. Indian red—unchanged. Crimson lake—this colour has all but disappeared from the paper; at one side where the colour was laid on deeper a brown streak still remains. Carmine—this, like the lake, has entirely gone, but where the carmine was laid on deeper a faint brown streak is still left. Madder lake—this colour has stood well, but it is now a little less red, and more of a purple. Purple madder—like the other madders this has stood, but seems to be changed very slightly in tone. Cyanine blue — seemingly unchanged. Prussian blue — unchanged. French blue—very slightly faded. Cobalt—I can detect no change in this valuable pigment. Ultramarine—is, of course, unchanged. Newman's azure—is unchanged. Indigo—where there was a rather deep wash of this colour the exposed slip shows now an exceedingly light tint of gre in fact, it has

nearly left the paper white, but has not vanished so completely as the crimson lake and the carmine. Lamp black—unchanged.

I may remark that the back of the frame was not pasted up to keep out the air, which in one way has added to the force of the test; but fifteen years' smoke and dust have accumulated on the whole surface, and laid a brown tint over all. This now affects the comparison between the exposed and unexposed slips.

I have promised to hand over all these slips to Sir James Linton to submit to the committee when it begins its labours.

TESSERÆ.

Costume in Painting.

J. R. PLANCHÉ.

SIR DAVID WILKIE did the writer of these lines the honour of consulting him respecting the elaborate picture of *John Knox Preaching the Reformation*. He was desirous, he said, of being very correct in the costume he had introduced, and requested a candid opinion upon it, the picture being then finished, and ready for removal to the Royal Academy for the purpose of exhibition. On its being pointed out to him that he had introduced in the gallery of the church military personages wearing the barred helmets of the time of Charles I. in the reign of Mary Stuart, he replied that his reason for so doing was that these persons were to be supposed to have visited the church with a desire to be unknown; and yet he had actually selected—more in the spirit of an Irishman than of a Scotchman—the open headpiece of the seventeenth century, through the bars of which the face was distinctly visible, in preference to the helmet of the sixteenth, the closed vizor of which would have defied scrutiny! The glaring absurdity of this anachronism was, notwithstanding, allowed by the great painter to remain, and to be disseminated by the burin of the engraver, although it might have been remedied in half an hour with as much advantage to the effect of the picture as to its historical accuracy. This anecdote "reminds us," as an inveterate story-teller would say, of one more creditable to the taste and intelligence of another Royal Academician. While Mr. A. Cooper was at work on the *Battle of Bosworth*, the painter consulted Sir Samuel Meyrick as to how King Richard III.'s horse should be caparisoned. "In silk housings, embroidered with the royal arms," was the answer, "covering the steed from his ears to his hoofs." "Oh!" exclaimed the mortified artist, "that will never do for me; my principal object is to paint White Surrey, and if I cover him from head to foot as you describe, I may as well not paint him at all." "But," rejoined the antiquary, "you tell me the moment you have chosen is that in which Richard made his last desperate charge and slew Sir John Cheney, Richmond's standard bearer. Now as this was at the close of the battle, the caparisons of the horse would probably by that time be cut and torn to shreds, and the colour and anatomy of the horse in that case might be rendered sufficiently visible for your purpose." The true artist jumped at the suggestion: the silken housings rent to ribbons streaming in the wind add action to the horse, tell a terrible tale of the fury of the fight, and completely satisfy the archæologist, while they display the peculiar genius of the painter, and give additional effect to the picture.

The Christian Basilica.

R. BURGESS, D.D.

The Christian basilicas, in their primitive form, were generally quadrangular. The branches forming the cross were introduced at a later period. It was a general rule to place them east and west, and this is the case with St. Clemente; but there were many exceptions when the nature of the locality required. The Basilicas Sessoriana, at the Sante Croce in Gerusalemme and Eudoxiana, were varied as to their cardinal points. Many of the churches in Rome at this day are out of this magnetic oriental line; and as to Ireland, St. Patrick seems to have given them all a twist towards the west, prophetically pointing the way across the Atlantic in the great exodus of the nineteenth century. But looking at an early legitimate Christian basilica, we may divide its parts into outward and inward. To the former belong the vestibulum and the atrium, to the latter the naves, the choir, and the sanctuary or bema. Beginning with the exterior parts, we may observe that the vestibulum of a private house was an intermediate space or area between the house and the public street; it was fenced by a wall, and often furnished with exedræ and recesses for the accommodation of persons who came to the levée of the patron at a somewhat earlier hour than the levées of modern times. That which the Latins called vestibulum, the Greeks called *πρόθυρον*, or *προπύλαιον*. We find an example of this vestibulum in the area which stands before the church of St. Clemente. The small portico of four columns, however, now standing must not be confounded with the ancient vestibulum; it is a work of the ninth century, and covers the original vestibulum. Similar specimens of this kind of access are still existing in the churches of St. Prassede, St. Maria in Cosmedin, St. Cosimato, and others; these may all be considered as works of the ninth century, when the forms of churches began to vary from the primitive style; they were, in fact, substituted to the ancient vestibule, to meet the changes in ecclesiastical discipline to which I have already alluded, and to which I shall again refer. From the vestibule, people entered by a door into the atrium. This consisted of a square court, surrounded by columns, and formed into a cloister. In St. Clemente, the atrium is admirably preserved; three sides are supported by columns; the fourth, which gives entrance, is supported by three brick arches. It is important to distinguish between the vestibulum and the atrium, because they are sometimes confounded both in word and in matter. The Greek word corresponding to atrium is *αἴθριος*, sometimes *αὐλή*, words expressive of an uncovered court. The open area of this atrium was sometimes planted with trees and shrubs; the mystic plants were preferred, as the cedar, the cypress, the vine, the rose, and such like, and hence the area so ornamented was sometimes called by a Latinised Greek word Paradisus—a name which the atrium of the Vatican Basilica retained long after the trees and mystic plants were replaced by marble pavement. In the middle of the atrium was one or more fountains, and if not fountains, a well or a cistern; in this it was the custom of the faithful to wash their hands before entering the church, a usage that is traced as far back as the time of Tertullian. Under the shade of the surrounding portico pilgrims were sometimes lodged; they served also for the habitations of the inferior ministers employed about the service.

Church Roofs.

WILLIAM BURGES.

Up to the fourteenth century I very much question whether that desideratum of ecclesiologists, an open roof, ever obtained in churches. Look at ancient twelfth and thirteenth century buildings that have not been restored, and you will find an hexagonal ceiling, the said ceiling in many places replacing the old boarding; but in some poor places, as in the little Sussex churches, it may just as likely have been original. In many instances the ceiling was even flat, or very slightly canted, as at Peterborough, Jesus College, Cambridge, and, I believe, Adel Church. Now, this boarding was useful in two ways: it afforded a surface for decoration, and it kept the church cool in summer and warm in winter. There was also a small window high up in the gable, to ventilate the air between the ceiling and roof. In our modern open roofs we have just the reverse; they are frightfully hot in summer, and cold in winter. Go into a church after a Sunday afternoon service, and observe how close it smells. Our modern architects put the little window in the gable because they find it there in the old examples; but with them it is of no earthly use but to afford light where light is not wanted, and to show the thin scantling of their timbers.

George IV. as a Patron of Architecture.

JAMES ELMES.

As it has been customary to give additions to the names of eminent princes, such as Louis the Great, Charles the Bald, Richard the Lion-hearted, so a biographer of the Brunswick family proposed to call the successor of George III. "George the Magnificent." As regent and sovereign of these kingdoms, he exhibited a love for architectural splendour more capricious than tasteful. Gaudiness was more esteemed than elegance, and George the Magnificent delighted more in the costly extravagance of the Diocletian school than in the tasteful grandeur of Pericles and Phidias. John Nash was exactly the architect to the regent's mind, and gilded profusion usurped the place and overlaid the purer taste that had been introduced by Chambers, Wyatt, Stuart, Dance, and Holland. Hence George IV. preferred the gorgeous profusion of the Roman school in its decline, to the sublimer truths of the Athenian in its greatest purity; hence he preferred the pretty beauties of the Dutch and Flemish masters to the sober and less apparent magnificence of the Roman school; hence he preferred cabinets and *bijouterie* to work of sterling merit; hence he preferred Canova to Phidias and hence, all the bad taste that emanated from the patronage of George IV. He decorated all the lower apartments of Carlton House, low in height as well as in situation, with Corinthian columns, redolent with burnished gold from abacus to plinth—so bright, indeed, that their proportions could not be scanned, and their only excellence were their extreme cost. This suite of apartments, which were level with the gardens next St. James's Park, and beneath the splendid suite of State apartments designed by Holland for levées and other regal purposes, were furnished by the architect, the cabinet-maker, the carver and gilder, the upholsterer and carpet-maker with almost Tiberian luxury, for the personal use

and comfort of the regent and his favourites, who could make their exits and entrances by the back way in the park, without ever going up to the public and royal part of the regent's palace. This costly and, as Holland left it, tasteful edifice, he swept away, and pulled down Buckingham House, the favourite residence of his father, to make way for the present Buckingham Palace, which all the patchings of Blore have not been able to lick into decent shape; neither has it a tasteful exterior nor a comfortable interior, as the complaints made to Parliament of the want of domestic accommodation fully prove. He removed the pretty Pavilion at Brighton for the capricious nondescript which now so expensively occupies its place. Before the removal of Carlton House, when George IV. entertained the greatest assemblage of princes and warriors that perhaps ever met together at the English Court after the great and terrible triumph of Waterloo, the entertainments were both extravagant and childish. A canal, filled with real water and living fish, meandered along the tureens and plateaux of the dinner-table till the unfortunate sufferers were killed and nearly cooked by the heat of the soups, the viands, and the *entrées*. There was also erected in the gardens a circular revolving temple or tent, moved by invisible machinery, designed by the chief architect whom the prince deigned to honour, for the admiration of the imperial, royal, and gallant visitors to the Regent of England. There was also a fragile Chinese bridge thrown over the canal in St. James's Park, which, had it been consumed by the illuminating lamps that showed its barbaric proportions to the gazing multitude, as it was threatened, it would have been spared the disgrace of a sarcasm and an early destruction from premature decay. When Canova shortly afterwards visited this country, partly to view our metropolis, and principally to feast his eyes upon the unequalled beauties of the Elgin marbles, he was accompanied in most of his perambulations by an amiable and eminent architect, whose name I may not mention without permission. He was so delighted with the simplicity and durable construction of Waterloo Bridge that he demanded of his guide if it were not built at the public expense? He was informed that it was erected by private untitled individuals; but, if he would accompany him a short distance, he would show him one built by royal command at the public expense, "from the designs and under the superintendence"—to borrow a favourite expression of our craft—of the chief architect to the Crown. He took his friend Canova to St. James's Park; he pointed with supreme derision to the pagoda bridge, and exclaimed, "Behold the work!"

Latent Heat in Timber.

W. HOSKING.

Mr. Braidwood, the able and intelligent superintendent of the London Fire-engine Establishment, stated in evidence, before a Committee of the House of Lords, his belief, from observation of many instances, that by long exposure to heat not much exceeding that of boiling water, timber is brought into such a condition that something like spontaneous combustion takes place; that the time might be eight or ten years; that is to say, it may have taken so long for the heat from pipes charged with or used to convey steam, hot water, or heated air, laid among the joists of a floor, or in the heart of a partition, or elsewhere in a building, encased in timber, to induce the condition necessary to the actual ignition of the timber.

Atmospheric Action on Stone.

MESSRS. HOFFMANN, FRANKLAND & ABEL.

The changes to which building stones generally are subject under atmospheric influences and under normal conditions must be ascribed to the action of the oxygen, carbonic acid, nitric acid, and water in the atmosphere. In the air of towns, however, there are certain other constituents, such as several acids of sulphur, and occasionally hydrochloric acid, which cannot fail to exert an additional disintegrating influence upon building stones. The action of oxygen must be of comparatively a subordinate character; its effects being confined to constituents which occur but rarely, and generally in limited proportions, in building stones; such as the sulphides of iron, and the protoxides of iron and manganese; these compounds, being very prone to oxidation, would tend to disintegrate the stones by the absorption of oxygen. Of far greater importance are the effects of carbonic acid and water. Carbonic acid in the presence of water is a powerful solvent, it not only corrodes the calcareous and magnesian carbonates (more or less powerfully according to their state of aggregation), whether they form the principal constituent of the stone, or are only present as cementing materials, but is capable even of attacking and gradually decomposing the hardest and most indestructible rocks. In the case of the calcareous and magnesian constituents of stones, carbonic acid acts by transforming the insoluble earthy carbonates into soluble bi-carbonates, which are thus removed from the substance of the stone; whilst its influence on silicious rocks consists in the elimination of the alkaline bases in the form of carbonates, and the separation of the silica in a more or less friable condition. The weathering of granites, and their gradual transformation into the several varieties of porcelain clay, afford an interesting illustration of the latter kind of action. In the changes just mentioned the carbonic acid and water are equally concerned, the water serving not only as a vehicle for the introduction of the carbonic acid into the pores of the stone, but also as a solvent for the products of its action. There are changes, however, to which building stones are subject in which water is the sole agent, and which are more of a mechanical than a chemical character. The expansion which water undergoes in freezing, and the irresistible force which it then exerts, are well known; it is obvious that water freezing within the pores of a stone must exercise a disintegrating action not less powerful than those above referred to. Recent researches have demonstrated that nitric acid is a frequent, and perhaps even a normal, constituent of the atmosphere, and, as such, must undoubtedly assist in the destruction of magnesian and calcareous stones; but the proportions in which this acid has been found are so minute that it need not be dwelt upon as an important destructive agent. This remark, however, does not apply to the acids referred to above as existing in the atmosphere of towns. The quantity of sulphur acids in the air of towns where a considerable amount of coal is consumed is quite appreciable. According to the determinations of Dr. Angus Smith, the air of Manchester contains an average proportion corresponding to 1 part of sulphuric acid in every 100,000 parts of air, which in the centre of the town rises to 25 parts in 100,000. No numerical data exist with regard to the proportion of sulphur acids in the London atmosphere; but it can scarcely be doubted that in the neighbourhood of the new Houses of Parliament they are present to an extent equal to the average amount found in the Manchester air; they must, therefore, be regarded as among the more important agents destructive to stone which are present in the London atmosphere.

Early Frescoes.

SIR G. G. SCOTT.

Wherever old frescoes are found, the clergy set themselves especially against them. In a church I was myself engaged upon in Cheshire, the whole walls were found covered with large figures and other decorations of a most interesting character. Their destruction was decreed. I interfered, and threatened the builder's foreman with dismissal if he carried out the sentence; but they cleverly allowed the question to go by default, and let them be destroyed by exposure to rain, while the roof was uncovered. In another place, the gentleman who paid for the restoration set himself earnestly to preserve a most remarkable fresco; but, while his back was turned, a workman, supposed to be bribed by another parishioner, chiselled it off. Even at Eton College, where the walls above the stalls were found to be covered with two ranges of oil paintings, in the manner of the Flemish school of the fifteenth century, the Fellows of the College had one whole range chiselled off from each side of the chapel, and the other range concealed by canopies which had never existed on the old stalls. This act of vandalism I saw myself being perpetrated. And so it is all through the country; the most interesting features of our old churches are being weeded out through the carelessness, the prejudices, or the deliberate barbarism of those who have to do with them. Nor can the architect in all instances prevent this.

Improvements in Building.

S. SMIRKE, R.A.

No mechanical art has within late years experienced improvements more numerous and important than that of building. An old house in London is rarely pulled down without revealing a construction faulty in principle, and careless in execution. Common sense is shocked by finding a thick wall of brickwork, carrying, probably, three or four floors besides the roof, built over a void space upon a piece of timber, the ends of which are, of course, liable to become rotten in a few years; and the whole of which may be, and often is, reduced to ashes in a few minutes: yet this mode of construction was universal until lately in our shops. The substitution of iron for timber is an improvement in the art of building that can hardly be overrated: it has banished at once the unwieldy girders which our ancestors were wont to truss, until they could hardly support their own weight; it has given us pillars that neither fire nor water can affect; and may almost be said to have afforded us the means of erecting an indestructible house. The very expensive, and often unsuccessful, process of piling for foundations has of late years yielded to the use of the artificial concrete substratum, the surprising strength and imperishable nature of which give it a value that cannot be too highly estimated by the architectural practitioner. The mode of baking bricks in clamps, instead of kilns, is a practice unknown until recent times, by which their hardness and durability are greatly increased.

NOTES AND COMMENTS.

A SUPPLEMENTAL set of conditions of the competition for the municipal buildings has been issued by the Edinburgh Town Council. It states that the Council do not bind themselves to carry out any of the designs submitted, but in the execution of any plan they may resolve to carry out, it is their intention that the designer of it shall be employed as architect; but the Council reserve this in their own hands. The Town Council prefer to leave the question of cost to the judgment of the respective competitors. Local architects have no advantage whatever in this respect, no definite or even approximate cost having been agreed on. The schedule also supplies competitors with detailed information on numerous minor points. Apparently a large number of architects will take part in the competition, and it may be accepted that as much fair-play will be exhibited in Edinburgh as in Glasgow. In the latter case the architects of the city were not successful in the first or the second competition, and it may be assumed that the Edinburgh architects will try to keep the prize among them.

THE difference between Scottish and English law was again shown in the arguments in the Edinburgh Court of Session respecting the removal of the statue of Sir PULTENEY MALCOLM from the Market Place at Langholm. The Road Trustees of the district were of opinion that it interfered with the approach of carriages to the Town-hall, and resolved to place it in the garden of a library. Several of the townspeople objected to the displacement of a memorial which had been standing in the most central part of the burgh since 1842. Admiral MALCOLM was, moreover, a man of some note, who at one time had charge of NAPOLEON. The objectors sought the interference of the court. The trustees claimed to have the property of the road and the buildings thereon, and a statue would be comprised in the latter term. Lord FRASER, who heard the claim, said his difficulty was in discovering any title of claim possessed by the objectors. The English doctrine about the dedication of ground for public purposes had not been accepted in Scotland, and his lordship was unable to discover any authority with a right to raise the objection. It appears the burgh has police commissioners and a magistrate, but they exercise no right over the statue, which apparently must be considered as if it were a stratum of metalling which can be taken up and shifted at the discretion of the overseers of the roads. With this example before them, the raisers of memorials in northern towns will henceforth have to think of the safety of the statues.

THE Birmingham Municipal School of Art began its session on Monday last. There is a central school in Margaret Street, with branches in the Cowper Street, Dudley Road, Hope Street, Jenkins Street, and Loxton Street Board Schools, all being under the direction of Mr. E. R. TAYLOR. The classes for elementary and advanced building construction and practical plane and solid geometry meet on four evenings of the week, instead of two as in last session, and the fee is only *7s. 6d.* a term—that is, until the end of January next. In addition, there is an architectural class meeting twice a week, and open to all students in the advanced evening classes. Mr. J. A. COSSINS, architect, has agreed to give a special course on architecture, to which free admission will be granted to as many as possible of the advanced students. Professor WINDLE will also lecture on anatomy to the students of painting. Although the fee for the classes is extremely low, the school is also able to offer twenty-seven free admissions to the schools, besides scholarships. The branch schools will be adapted to the requirements of local trades. The Birmingham Art School has had many successes, and it is evidently the aim of the committee, over which Alderman KENRICK, M.P., presides, to make the school have a real influence on the manufactures of the town.

THE Germans are not only carrying off English trade, but should necessity arise for a work of architecture in a foreign country, they are enabled to utilise it. A meeting was lately held in Berlin by the archæological and architectural societies of Germany, in order to welcome Herr BAURATH BÖECKMANN, who has come back from Japan, where he has been designing a new palace for the Mikado, and offices for the Government. It is evident from this that Germany is well served by its representatives abroad, who never allow an opportunity to escape of serving the interests of their countrymen. British officials are of so high a caste that it would be an insult to them to suggest how their diplomacy might be turned to account in securing a commission for an English architect.

THE accidental death of Mr. CHARLES PERKINS has been a loss to American connoisseurship. He was a leader in that band of students who have shown their native energy in grappling with the difficulties of the history of art. Boston and Harvard might well be proud of so distinguished a son. He studied art in most of its forms, but he is likely to be remembered by his volumes on Tuscan sculptors and Italian sculptors, with their beautiful etchings. At a later date he wrote a handbook of Italian sculpture, and his volume on GHIBERTI, the sculptor, forms a part of the Bibliothèque Internationale de l'Art. He was as enthusiastic about music as about sculpture. Of late years Mr. PERKINS directed the art museum in Boston. The cause of his death was the overturning of a carriage in which he was riding.

SUBSCRIPTIONS to the guarantee fund of the Paris Exhibition of 1889 can now be paid. The great commercial establishments, "the monster houses" of Paris, display their rivalry in the lists. The "Bon Marché" on the left bank is entered for 500,000 frs. The "Louvre" comes second with 400,000 frs., and the "Printemps" (that is the shop near the San Lazare Station designed by M. SÉDILLE, and the most original of its class in the city) is third with 250,000 frs. The two rival bronzists, CHRISTOPHLE and BARBEDIENNE, are put down for 50,000 frs. each. M. GEORGES BERGER, the Professor of Art History, who holds one of the highest posts in the administration of the exhibition, shows his confidence in its success by offering 1,000*l.* The banks and financial societies are expected to contribute generously. The Banque d'Escompte offers 600,000 frs., the Banque de Paris 300,000 frs., and the Banque Parisienne 300,000 frs. It must be owned that, as yet, the reponse to the appeal has not been answered with the readiness that was anticipated. The cause must be put down to the unsettled state of the political world at the present time. Let more confidence be established, and it will be found that the country will be liberal, for there are encouraging signs of a return of prosperity.

THE eighteenth arrondissement of Paris contains the northern heights of Montmartre, Clignancourt, and La Chapelle. It is all historic ground. The word "Montmartre" is said to be derived from "Mons Mercurii," the hill of Mercury, or from "Mons Mars," the hill of Mars—either being suggestive of the Roman occupation. The most popular etymology, "Mons Martyrum," the hill of the martyrs, is no less interesting. According to the legend, it was there St. DENIS was beheaded. A church dedicated to the martyr existed in the ninth century. The abbey of Montmartre was famous until 1790, when it was suppressed. The last abbess was the Duchess of MONTMORENCY. She was not only of advanced age, but was blind and deaf. When accused before FOUQUIER-TINVILLE of conspiracy against the Republic, the duchess was condemned and executed. From the position of the hill, which commands the city, it has been occupied by all the forces who attacked Paris, beginning with the Normans in the ninth century. The history of La Chapelle does not appear to extend beyond the fourteenth century. Clignancourt can hardly be said to have a history, as until lately it was open country. A district like Montmartre affords a profitable subject for archæological investigation, and a society has been formed with the title of "Old Montmartre," for the purpose of identifying and preserving any ancient monuments or other relics which may be traced. The work of the society is interesting, and it is surprising an attempt of the kind has not been made earlier. From the number of artists who reside in or near the district, there will be no lack of support.

ARCHITECTURAL ILLUSTRATION SOCIETY.*

NO. 23. KNIGHTON SPINNYS, LEICESTER.

OFFICES, BLOOMSBURY.

THIS block of buildings was lately erected from the design of Mr. R. J. WORLEY, 48 Cannon Street.

HOUSE, SEFTON PARK, LIVERPOOL.

THIS house was erected not long since for Mr. JOHN TURNER, and is situate on the west side of the park, with good views towards Mossley Hill and Woolton. It is built of common brick with pressed brick and Stuarton stone dressings. The cost was about 3,000*l.* Mr. THOMAS URMSON was builder, and Mr. JAMES N. CROFTS, of Liverpool, architect. The drawing is by Mr. G. E. CARROLL.

THE REFORM OF THE ROYAL ACADEMY.

IN a letter published this week, Mr. Holman Hunt offers some further remarks on the organisation of the Royal Academy. He writes :—

"R.A.," in a past letter, makes ingenious calculations, showing how few in numbers are the works actually contributed by members. This would have more weight were it not stamped in the memory of all exhibition-goers that every season important places are filled with pictures by Academicians which it would be better for all concerned to have hidden in depths of darkness. Mr. Armitage represents the minority in the Academy who are comparatively liberal, and I am sure he would do all that might be possible to gain the concession of more space to outsiders, but the petitioners—with whom, let me repeat, I had no connection—on the rejection of their modest memorial, all became convinced, as I had been many years before, that the Academy as now constituted would do nothing for English art which clashed with the commercial interest of its members, and that it was therefore necessary to found a national institution to represent art interests. I thoroughly agreed in the declaration drawn up, and signed it, but thinking that public opinion might have taught the body wisdom, I afterwards through your columns made an appeal to the Academy for a radical reform of its abuses, with an alternative request to the higher powers to interfere, and put the institution into a sound condition, suited for the circumstances of the day. Mr. Armitage wishes now to confine the discussion to the original question, but the tide has gone past for thus satisfying the demand for reform. The granting of the boon asked would have staved off discontent only a little while. No one outside the Academy thinks of it now. It is becoming a fixed conviction that the body are too prosperous to be teachable. Their champions finesse with the real question, striving to discredit all as bitter enemies who are acting as their only true friends. To say that as it stands the institution is an anachronism is only expressing the opinion of the whole world giving any attention to art, or even to social questions. If the members would be convinced, the Academy might yet take a true position. If they will not listen, it is only necessary for the younger artists to be staunch in all their high aims to induce Government to interfere with a strong, and it may then be a violent hand. The Royal Academy must be made somehow to fulfil the laudable intention of its founder, George III., not in word only but in the very spirit of our day. Our case is proved. Architects, sculptors, painters, decorative designers, masters, and students, all have borne witness independently of me—for I do not know one of your other correspondents—to the make-believe character of the institution, and we have only to find a member of Parliament to take up our cause and demand a new Royal Commission, which shall at least have its recommendations effectually endorsed by Government.

At the last Commission, believing there would be other forces brought to bear to effect a radical change in the nature of the body, doubtless many as well as myself avoided to make complaint which could not be uttered without injury to the feelings, and even the solid fortunes, of many amiable gentlemen with whom we were more or less intimate, and whom we respected privately. It is a difficulty in our case that every question touches some personal interest, but it is the consequence of the traditions of the institution that within its walls men who have no due qualifications for the duties on which the well-being of the school depends have been provided for, to the destruction of all the great opportunities for the future. We must prove with the actual facts at hand that the institution thoroughly fails in its object; that, being founded for the encouragement of the art of design, the effect of its activity and of its inactivity is the discouragement of this; that its schools are less effective than those attended by the first English artists in London which it displaced; that its supervision of the material interests of art is worse than *nil*, for it has lost the secrets of tradition and done nothing in substitution; that every generation has, together with the great names on the roll, a majority of nonentities who outvote the wise members and resist all healthy action, whose interest is to elect men of their own calibre and sentiments to power, and who, except under stress of self-preservation, never give up their opposition to an artist of independent genius, so that all such have to struggle for the best years of life against impediments netting them round in all directions; that when at last these better artists are elected, after some ineffectual attempts to improve matters, they are driven to attend only to their own affairs and opportunities, and passively then give a character to the body which it does not merit. If it be necessary to designate individuals as unworthy professors, the sense of responsibility to the country must outweigh the impulses of personal regard.

For my part singly, I will avow that there is not a member of the body known to me for whom I do not have esteem at the least. It is the system which is at fault. It is wrong in its inception. Many men would have made the influence exercised even more unbearable than it is at present. Services to the country in other pursuits can be estimated better at the time than afterwards. The service of arms, of diplomacy, of government, of geographical research, of science, and even of literature in some of its branches can be duly weighed. Let them be rewarded with special distinction to the full. Let Court artists of all branches also have their honours; but to pretend to select the greatest artists of the day—the relative value of artistic creations only being measurable at a distance of years—will always result in the ennobling of men like Howard, Hollins, Creswick, Lee, Rippingale, Calder Marshall, &c. (I feel pain at the trial to write the full list), and giving them a patent to ruin rivals like Haydon, Muller, Linnell, Rossetti, whose list would be a larger and grander one had not so many been effectually worsted in the struggle which they had to engage in. All that is needed for recognition is what is precious for protecting and fostering the study of art—the appointment of artists who have become masters to a position of control, to be continued for a few years, with the mark of this dignity in retirement. An artist's nobility, then, would depend simply upon the excellence of the work he had done and the aid he had given to his brethren, which, as years grew, would be ever more truly appreciated.

ST. ALBANS ABBEY.

THE letter of Lord Grimthorpe, published last week, has drawn the following reply from Canon Venables :—

Lord Grimthorpe—still better known by his former name of Sir Edmund Beckett—begins his letter by expressing his approval of much that was said by me in the letter of August 28 by which his was called forth.

May I follow so high an example and begin my reply with expressing my approval of much that has been done by Lord Grimthorpe, or under his direction, and I believe entirely at his expense, in preserving the abbey church of St. Albans from the ruin which threatened it, and maintaining it, to adopt his own term, "as a grand living cathedral?" I believe that the structural repair has been conducted with admirable skill, as it certainly has been conducted with unstinting liberality, and that the nave, which a few years back was in a "failing" or "falling" state—we will not quarrel about terms—has been placed in a condition of perfect stability. For this his lordship deserves the hearty thanks of all lovers of our national historical and architectural monuments.

But I must follow Lord Grimthorpe a little further, and ask of him as he asks of me, "why he spoils a good case by chaining it to a bad one?" Granted that great structural repairs, amounting to a large extent to actual rebuilding, were necessary to convert the vast decaying nave of St. Albans into "a live church for the use of live souls," does that afford a satisfactory reason for furnishing it with a west front, entirely new in the upper and larger portion, and for the destruction of the old one? It is true that the west front, as the builders of the fifteenth century left it, could never have been a very beautiful thing, and it had suffered so severely from later churchwarden

* No. 22 (published last week) should have been described on plate as "Stowel Park, Gloucester. Mr. John Belcher, Architect."

hands as to have lost almost all the beauty it ever had. But it was an historical feature. It was an actual fragment of St. Albans while it was still a living church, the work of one of the long series of mitred abbots. Not a mere botch or makeshift, but, however little some may have found to admire in it, an actual expression of the taste of the age while architecture was still a living art. As such I maintain it ought to have been preserved. It needed "mending," as Mr. Freeman would say. Very likely the whole of Abbot Wheathampstead's immense west window would have had to be taken down and rebuilt. And after all it might have seemed hardly worth the pains. But, to adopt Mr. Freeman's words again in the amusing and interesting letter in the *Times* of to-day—in which (I hail the omen) my old friend seeks to heal any differences between Lord Grimthorpe and myself by setting us to work side by side for the preservation of Aldhelm's "ecclesiola" at Bradford-on-Avon, one of the most priceless architectural monuments of our country—if the course which I consider the only right one had been taken we should have had Abbot Wheathampstead's own west front (I speak, of course, only of the upper portion, not of John de Cella's Early English porches), "made decent and in order, not something else out of" Lord Grimthorpe's "own head put instead of that west front."

The term "Brummagem," as applied to his work, gives offence, and very natural offence, to Lord Grimthorpe. Let me justify its application. "Brummagem," as ordinarily used, does not mean "bad," but something showy and attractive which pretends to be what it is not. I trust I shall not increase Lord Grimthorpe's anger if I venture to assert that this exactly characterises the new west front he has at immense cost put up at St. Albans. It is showy and attractive, and by its style and details professes to be a work of the thirteenth century, when it is actually a work of the nineteenth. It is not "bad"; but it is untrue, and this untruth has been perpetrated by what I termed in my former letter "the wholesale destruction of old work," which was "worn, homely, and failing." When I spoke of "destruction of old work," I had also in my mind the demolition of the south-west turret of the south transept and the recent pulling down of the vaulted stype under its gable wall, and the removal—I trust only the temporary removal—of the very curious Norman arcade which ornamented its north wall. With regard to the turret, I have no desire to meddle with the controversy carried on between his lordship and Mr. James Neale last year, except so far as to say that it is strange how any one with any knowledge of architecture could for an instant doubt that, however much it may have been patched and repaired, and however ruinous its state—a point on which there are always two opinions—this turret, like that of the opposite transept, was, with the exception of its battlements, a genuine Norman work, almost certainly belonging to the original church of Abbot Paul. The turret and the whole south face of the transept, including the large perpendicular window, have been removed—Lord Grimthorpe will probably say to prevent their removing themselves by falling down—and the whole architectural public is still anxiously waiting to see how they are to be rebuilt.

I am not, happily for myself, in the witness-box of a court of law subjected to Lord Grimthorpe's cross-examination, and whatever he may "know that it means," he must pardon my giving "distinct answers" to each of his series of questions. The first and most important I have already answered. I would only inform his lordship that the way in which "the Lincoln restorations are done" is that on which he passes so strong a condemnation, adopted by Sir Gilbert Scott and Mr. Oldrid Scott at St. Albans, viz. that of taking out any dangerously decayed stones, archmolds, or shafts, and replacing them with new, and that we do not find such portions "the shabbiest parts" of our minster and "yearly getting worse." Happily, we have good quarries at hand, and masons with practised eyes to select durable stone. The system Lord Grimthorpe recommends was strongly urged upon us some years since by an architect sent down by the Ecclesiastical Commissioners—not Mr. Ewan Christian—who recommended us to take down and entirely rebuild the whole Early English north clerestory of the nave. I am happy to say we did not follow his advice—indeed, we never entertained it for a moment—but continued the system we had followed for many years of gradual restoration where absolutely needed, a system which is that adopted by our present architectural counsellor, Mr. J. L. Pearson. This, I venture to assert, is the only right system to follow in the restoration of ancient buildings. I would conclude my letter with confessing myself, with Mr. Freeman, in the letter already referred to, as "neither a ruinationist" nor yet a "substitutor of new work for old." The re-erection of the high-pitched roof at St. Albans, which "in a lucid interval" some years back I advocated in your columns, does not come under the latter category, as, though the roof was new, it was simply the repr duction of an important feature, the loss of which was due to an economical repair, not to a desire for architectural improvement, however possibly mistaken.

Mr. William White also writes :—

Allow me to correct a slight mistake into which Baron Grimthorpe appears to have fallen, and which has probably influenced some of his remarks. Most of the antiquaries and members of the Institute who objected to the removal of the low roof over the nave of St. Albans certainly did not contend that it was the original roof. They could see that under the altered conditions of walls and parapets not one of the high-pitched roofs which had successively existed previously to the erection of the low one could be restored as it originally stood, and they grudged the loss of this Mediæval relic. The lines of the lowest of the high-pitched roofs of Norman date coincided exactly with the old Norman corbel table which still remained over the three easternmost bays of the nave on the south side, and which was, most unhappily, removed in order to continue the more handsome corbel table of Mediæval design. It is not for me to raise any question as to Sir Gilbert Scott's grounds whether for insisting upon, or acquiescing in, this alteration or otherwise. But to me personally it was most unfortunate thus to break an interesting link in the architectural history of the abbey, and, so far as could be seen, without any sufficient reason.

SIR SAVILE LUMLEY'S GIFTS TO NOTTINGHAM.

THE following are the letters in which the English Ambassador at Rome offered his collection to the Nottingham Museum :—

Rome, July 2, 1886.

Sir,—Having heard that the Museum at the Castle of Nottingham is somewhat deficient in specimens of classical antiquity, it has occurred to me that a collection I have lately made of objects found on the site of the Temple of Diana Nemorensis, the Artemisium of Strabo, which I have discovered and excavated on the shore of Lake Nemi, might be acceptable to the Museum of which you are the director.

The collection comprises 470 pieces of terra-cotta, consisting of votive offerings, mostly of an archaic character, portions of friezes, and fragments of figures of a later and finer period of art, lamps, lachrymatories, and ointment bottles; likewise sixteen bronze statuettes, representing nymphs and priestesses of Diana, and thirty other objects and fragments in bronze; 740 specimens of money of the Roman Republic, dating from the very earliest period of the "aes-rude" and cast "aes-grave" down to coins immediately preceding the empire, as well as some imperial coins, and several interesting inscriptions and other fragments in marble.

Some account of the discovery of the "Artemisium" is given in a summary of a paper read by me at the British and American Archæological Society of Rome, and which appears in several numbers of the journal of the proceedings of that society, the first and second numbers of which I take the liberty of forwarding herewith.

I also propose offering to your museum a portfolio of photographs of the remains of the temple, and of the objects found on its site, which I have taken on the spot, which will give some idea of the nature of the collection I am desirous of presenting to the Nottingham Museum.

Should the committee of the Town Council decide on accepting my offer, I venture to suggest that the collection should be kept together, as these objects were all found on the same site. Their high antiquity, perfect authenticity, and good state of preservation will, I trust, prove instructive as illustrating a phase of Pagan worship of the earliest period of Roman history, in a temple all trace of which has been lost for more than fifteen centuries.

I should add that as, in accordance with my contract with the landowner, one-half of everything I discovered fell to Prince Orsini, many of the objects shown in the photographs are not to be found in my collection, but I have had a copy made in plaster of Paris of a remarkable double-headed bust, which fell to his share, representing two aquatic divinities, supposed to be the genii of the Lakes Nemi and Albano, which will also be found in the collection I propose sending to Nottingham.

Unfortunately Prince Orsini has insisted on my filling up the excavations I have made, so that the only record that will remain of the existence of the "Artemisium" on Lake Nemi will be my collection and that in the possession of Prince Orsini, and the photographs I have made on the spot.—I have the honour to be, sir, your obedient servant,

J. SAVILE LUMLEY.

Rome, August 8, 1886.

Sir,—I propose sending you to-morrow a portfolio of thirty photographs, taken on the spot, of the site of the Temple of Diana Nemorensis, the Artemisium of Strabo, as well as of the principal objects found there during the eight months in which I was engaged in excavating that temple. These specimens of

the different classes of objects found there will give you some idea of the nature of the collection.

The terra-cotta votive offerings and fragments of statuettes will occupy seven cases, the objects in marble, inscriptions, &c., will fill two more, and two stelæ and a basalt base with inscriptions will be packed in separate bales; the coins, bronzes, and finer specimens in glass and terra-cotta will be packed in separate cases contained in one large case.

A list of the photographs will be found in the portfolio. The portrait bust and stelæ represented in No. 21 will not be found with the collection, as it forms at present part of the ornamentation of the vestibule of this embassy, but I shall have the pleasure of presenting it to the museum when my mission to Rome ceases.

It has not been possible for me to classify or even make a correct list of the objects in terra-cotta, of which there are about 500, without counting the fragments of two friezes. The coins, which are all of the Roman Republic, are about 750 in number, and these I have classified, taking for my guide the great work of Garucci, the best authority on the early Roman money.

The portfolio contains also an extra photograph of objects which I had intended for my private cabinet, but which I also send to Nottingham, in order that the collection may be as complete as possible. It includes two small coloured glass vases of Greek work, three terra-cotta heads, as fine as any found at Tanagra, and a curious mask in coloured glass, probably Etruscan; the bronze sole of a sandal, considered to be unique, and a bronze sacrificial ladle with the name Diana in archaic characters engraved upon the stone.

I propose sending the portfolio by express on Monday.

The cases with the collection itself will be forwarded by steamer for Leghorn, and I should be glad to know whether you would prefer these being sent to London or to Hull in the event of a steamer starting for that port from Leghorn.

I shall be glad to hear of the arrival of the photographs.

Believe me, yours truly,

J. SAVILE LUMLEY.

GLASGOW ARCHITECTURAL ASSOCIATION.

AT last week's meeting of this Association, the vice-president (Mr. Wm. J. Boston) being chairman, a paper on Stirling was read by Mr. Henry Baldie. An interesting account was given of the vicissitudes experienced by the old church of the Greyfriars, the castle, and other principal buildings, and the more characteristic features of each pointed out. The castle in particular is now shorn of much of its former glory, only the basement storey remaining of what was once an imposing gate-house. These were all illustrated by a series of large charcoal drawings and numerous sketches prepared by Mr. Baldie, who was awarded a hearty vote of thanks at the close of the discussion which followed.

THE CATHEDRAL OF SIENA.

MR. W. D. HOWELLS, in one of his recent publications, has classed this exquisite building along with such objects as the Pyramids of Egypt, St. Mark's at Venice, the sweep of the Arno at Pisa, and the Falls of Niagara, characterising them as things to be seen but not described. It may seem rash to venture upon a task forbidden by so high an authority, especially in matters Italian, says a correspondent of the *Glasgow Herald*, but for the benefit of many who have never seen Siena, and with the object of inducing visitors to Italy to include that most interesting old town in their programme, this article may not be altogether amiss. For it is to be feared that comparatively few out of the great stream of tourists find their way there, especially since the opening of the railway from Terontola to Chiusi, which is the route now taken by the express trains between Florence and Rome. Moreover, the attractions of other cities are so numerous and so powerful that naturally those whose time is limited pass over all save the five or six chief towns of the Peninsula. Siena, however, has a charm all its own, and a visit to it, however short, amply repays the time so spent. Its situation among the hills at an altitude of over 1,300 feet from sea level gives it an atmosphere healthy and clear, and a temperature which in warm weather may be called cool when compared with the stifling airlessness of Rome, or the broiling heat of Florence.

The buildings of the town are disposed somewhat in the form of the three-legged emblem of the Isle of Man, a configuration due to the meeting of three spurs of hills upon which the place is built. The streets are all of them winding and narrow, while some of them are so steep as to be partly formed of steps, upon which vehicles without wheels are slowly dragged by oxen. Some of these narrow passages are built over in a way which, together with their steepness, recalls the closes of the old town of Edinburgh, only that they are much cleaner than those purlieus of the High Street of the Scottish capital. The principal street is the Via Cavour, which is approached from the railway station by the Via Garibaldi, and leads to the Piazza Vittorio Emanuele, a combination of honoured names to be met with in every large town of "Italia Redenta." This Piazza, formerly called the Piazza del Campo, and mentioned by Dante in the eleventh canto of the "Purgatorio," is the centre of what life and stir are to be found in the city. It contains the Palazzo Pubblico, a large brick pile of the thirteenth century, with a tall and graceful tower.

While the chief activity of Siena is found in the Piazza Vittorio Emanuele, its beauty and repose centre in the beautiful church in the Piazza del Duomo, on the highest part of the city. Victor Hugo has described Nôtre Dame at Paris as "une vaste symphonie en pierre," and as there are unfinished symphonies in music, notably that of Schubert, so there may also be unfinished symphonies in architecture, for the intention of the people of Siena was to erect an enormous cathedral, of which the present building would only have formed the transept, had not the evils of war and pestilence so severely crippled the resources of the Republic that the ambitious plan had to be abandoned. The structure as it exists is thus a monument of what the piety of the Sienese enabled them to achieve, and of what their misfortunes prevented them from accomplishing. It is not of the colossal dimensions of many other celebrated cathedrals, being not more than 290 feet in length and 78 feet in width; but it possesses the usual component parts of a cathedral, viz., nave with aisles, choir, and transepts so proportioned as to produce a harmonious whole. The style of the work is Gothic, and the material used is marble, while its construction occupied about a century and a half, being completed in the year 1380. The side walls are comparatively plain, being built of white marble, with occasional bands of black marble, and they are pierced by the usual pointed windows, plain in the ground storey and traceried in the clerestory, while statues are disposed along the top of the walls. The campanile, of alternate stripes of black and white, is placed beside the north transept, and rises to a height of six storeys above the main building, terminating in five pinnacles. The façade is a singularly rich piece of work in white marble, relieved by panellings of red and black. It is a mass of beautiful sculptures of angels, prophets, animals, and other devices—a perfect romance in marble. The designer was Giovanni Pisano, and it is more than probable that this distinguished artist was the superintendent if not the actual sculptor of some part of its lovely carvings.

The doorways of beautiful clustered pillars give access to the interior of the building, where the arrangement of alternate bands of black and white marble is a very striking feature. The elaborately-carved arches of the nave are borne by handsome pillars, from the lower parts of which there spring with great freedom and boldness consoles, upon which are placed statues representing the founders of the various orders in the Catholic Church, while the cornice above the arches consists of long rows of busts of Popes in terra-cotta. The intersection of the nave and transepts is covered by a dome, which by some caprice of the architect takes the form of an irregular hexagon. The aisles and transepts are divided into numerous chapels, for the most part gorgeously decorated in the sumptuous Roman style with lapis lazuli and variegated marbles, and still further enriched with many treasures in sculpture by such mighty artists as Michel Angelo, Donatello, Nicolo Pisano, Giovanni Pisano, and Jacopo della Quercia. A soft yet bright light pervades the whole and blends into pleasing and satisfying harmony the boldness of the nave and the more exquisite portions of the building.

A unique feature of this beautiful sanctuary is the engraving upon the pavement, which is quite covered with *graffiti* representations of scenes and figures, chiefly from Old Testament history. These are protected by coverings of boards and floorcloth; many of the figures are simply outlined and filled in with black, while others are filled with materials of various colours, giving them more a pictorial than a sculptured effect. Under the dome are preserved the two flagstaffs which carried the ensigns of Siena on the *carroccio* or standard waggon of the period, in the great victory gained by the Ghibellines over the Guelphs in the year 1260 at Montaperto, a few miles distant from the city. Similarly are preserved in the Campo Santo of Pisa the great iron chains which closed the passage of the Arno during a war with Florence; and in like manner there is preserved, on the field of Bannockburn, the "Borestone," upon which King Robert Bruce is said to have planted the lion rampant on the day of Scotland's great national victory.

About the middle of the fourteenth century misfortunes overtook the vigorous little republic "on Tuscan hills," for a time the rival of Pisa and Florence, but the piety, the patriotism, and the love of art which then distinguished its citizens are

commemorated to succeeding ages by the exquisite temple which sits upon the brow of their city like a crown of glory, a crown of many gems.

PRESERVATION OF MANORIAL RECORDS.

AT the annual meeting of the Cumberland and Westmoreland Archæological Society it was announced that among the communications received from the Society of Antiquaries of London was a circular letter, which was accompanied by a memorandum on the subject of manorial records, adopted at a meeting of the Special Committee of that Society on February 4. The memorandum, in pointing out the great historical interest and importance of the ancient Court Rolls in throwing light on the habits and civilisation and the legal and social condition of the inhabitants, stated that the tendency now was more and more in favour of freehold tenure of land, so that within a comparatively short period it was probable that manors, with their attendant formalities, would become things of the past. The documents relating to them would become practically valueless for legal purposes, but the Society were anxious that steps should be taken for the preservation of Court Rolls and other manorial records. In the Bill for the compulsory enfranchisement of copyholds was a clause providing that in certain events the Court Rolls and other manorial documents might be deposited with the Master of the Rolls for safe custody, with right of access. Their deposit with other institutions might, if thought desirable, be accepted by certain stipulations as to powers of resumption. The principal difficulty in dealing with the matter was that of bringing home to the minds of the lords of the manors and their stewards the value of the documents; but to do this nothing more seemed necessary than to call their attention to the subject, and the Society suggested that if copies of this memorandum were sent to those who might probably have ancient Court Rolls and records in their custody in the different districts by the various Archæological and Antiquarian Societies and Associations, the desired result would follow.

GLASGOW ARCHÆOLOGICAL SOCIETY.

THE Glasgow Archæological Society, following its custom now of many years' standing, made its annual excursion on Thursday in last week. Leaving Buchanan Street Station at 9.20, the party, which numbered about thirty, arrived at Larbert, and thence drove to the Torwood. Among those present were Professor Young, M.D., ex-president; Preceptor Wilson, ex-Preceptor Mathieson; Messrs. John Honeyman, C. D. Donald, jun.; J. O. Mitchell, and J. Dalrymple Duncan and William George Black, hon. secretaries. At the foot of the road leading to the Broch of Tapock, Mr. J. C. Bolton, M.P., on whose property it is situated, welcomed the visitors to the locality. The weather, happily, continued dry while the hill was ascended, and a very fine view was obtained of the surrounding country from the grass-grown summit of the Broch. Mr. Dalrymple Duncan, F.S.A. Scot., read an instructive paper relative to this peculiar form of prehistoric architecture. A broch may be defined as a hollow circular tower of dry-built masonry, from 40 to 70 feet in total diameter, having within the thickness of its walls a series of chambers and galleries lighted by windows, all looking into the central area, or well, not outwards to the surrounding country. The only opening to the outside is a doorway through a tunnel-like square-headed passage, with slightly inclined sides 5 to 6 feet high and about 3 feet wide, constructed in the thickness of the wall. The latter, which is from 9 to 20 feet thick, is solid for about 10 feet from the ground, except where it is pierced by the entrance, or partially hollowed out by the construction of oblong chambers with rudely vaulted roofs. Above this the wall is carried up with a clear space of about 3 feet wide between the exterior and interior portions. Into this hollow horizontal ranges of slabs are inserted at intervals of five or six feet, thus forming galleries about 6 feet high and 3 feet wide, which run completely round the tower. These galleries are connected by a stair which runs up to the top of the tower, and are lighted by windows in the inner wall of a peculiar construction, placed vertically over each other. The central area is from 20 to 45 feet in diameter. The Tapock Broch, however, does not present all the above features. The upper hollow storeys of the tower are wanting, but the lowest floor, the entrance, and the staircase are all in a state of perfect preservation, and present numerous features of great interest. Brochs are peculiar to Scotland, and their purpose was probably to provide a place of temporary shelter during a hostile incursion, but to what race they owe their design it is impossible to say. They are assigned, roughly and indefinitely enough, to the Iron Age, and are believed to be Celtic. Their resemblance to the round towers of Ireland is merely superficial, but the distinction between the two types of tower scarcely permits of adequate discussion here. The Tapock Broch was discovered by Colonel Joseph Dundas, of Carronhall, in 1864. At the time of Colonel Dundas's excavations the mound was covered with heather and brackens, and surrounded by clumps of large fir-trees. Operations were first commenced on the south side, and resulted in the discovery of the staircase, the doorway of which was completely blocked with rubble. After the removal of about 200 tons of stones and earth the broch was found, with its circular wall 15 feet thick enclosing a central area 35 feet in diameter.

After a careful inspection of the broch, the party proceeded to Torwood Castle, some time the residence of General Baillie, the opponent of Montrose. It is probably not of earlier date than the middle of the sixteenth century, and is a mere juvenile compared to the broch half a mile off. Mr. Bolton afterwards entertained the society to cake and wine at Carbrook House.

On leaving Carbrook the visitors drove past the field of Bannockburn to the Royal Hotel, Stirling, where they were met by Provost Yellowlees and Mr. W. B. Cook, who accompanied them to the historic and architectural sights of the royal burgh. After inspecting several of the old Stirling houses, the East and West Churches were visited, and their historical points of interest described by Mr. Cook. Mr. Honeyman briefly pointed out the features of architectural interest. Crossing the way to Cowan's Hospital, the various curiosities preserved in the Guildry Hall were exhibited. On reaching the Castle a thorough examination of the interesting fortress was made. By kind permission of Colonel Templeman, several portions of the building were thrown open. The party then proceeded to the inscribed Roman Stone on the Gowlin Hill, and the "Heading Hill"; the neighbouring Moat Hill was examined, and opinions not altogether favourable to Miss M'Lagan's contention that it was an ancient British fort were expressed. It is much to be hoped that the proposal to form a cemetery on the Gowlin Hills will not be carried out. The Smith Institute was also visited, and Mr. Sword, the curator, exhibited the many curious treasures admirably housed there.

The society dined in the Royal Hotel at 6.30. Professor Young occupied the chair, and Mr. Honeyman, vice-president, acted as croupier. The Chairman proposed the toast of "The Burgh of Stirling," to which Provost Yellowlees responded. The toast of "The Society" was proposed by the Provost, coupled with the name of Mr. Honeyman, vice-president. Preceptor Wilson, in proposing the health of Mr. Cook, referred to the great advantages enjoyed by the party in having as their cicerone one so thoroughly acquainted with the archæology and history of Stirling, and to the very enjoyable day which the society had spent. The party left Stirling at 8.25, after a very pleasant day's excursion.

MR. W. MORRIS ON EDUCATION IN ART.

ON Wednesday, Mr. William Morris delivered a lecture at the rooms of the Clerkenwell branch of the Socialist League, on "Education," in which the lecturer gave some account of his own training. He said he was intended for a parson, but his inclination led him to the study and practice of art. Ultimately, seeing the degradation into which the minor arts of life had fallen, he conceived the ambition of trying to set matters straight in this direction; of inducing people to notice how beautiful the ordinary arts of life became in the Middle Ages. When he began his enterprise he commenced to perceive, however, that in the present state of society it was impossible to carry out this kind of art. It was necessary that a man in his daily life should be a free man in order to turn out work that had any really artistic capacities in it. This fact stopped him in his enterprise to a certain extent at the outset, and had hindered him ever since, because, after all, the workman of the present day was not free, and hence could not turn out a free man's art. When he (Mr. Morris) started on his career of seeking to improve the decorative arts—the architectural arts—he was laughed at. He was, however, able in the result to establish a kind of a position which enabled him to live by the practice of his art and the sort of study which he liked best. He managed at last to be able to force people into paying him for his work. He could not, probably, have succeeded unless he had been at the beginning a rich man. He spent a great deal of money and time before he reached the position that rendered his work profitable. Three elements were essential in all education. The first was inclination, the second opportunity, and the third was help from the people who had gone before. The general idea of education for the working classes did not concern itself with the inclination of the workers. Abundant leisure was requisite to all education worthy of the name. Real technical education meant that a man should be instructed in the use of his hands and in the nature of material, so that he would be able to follow the form of useful industry which suited his individual peculiarities best. Nor could he see why his education in that light should stop short of learn-

ing one craft or art. His own personal experience showed him that it was possible to learn two or three different handicrafts or arts. Our present system of education was simply the education of one set of people to become the machines by means of which the other set could carry on their life to the injury of the community in general. Even at the Universities the ideal of education was a commercial one; it was wholly and solely directed to the achievement of success in a man's future commercial career. So long as the mass of the workers—the people upon whom everybody depended for their daily life—were kept in a state of degradation, so long would it be impossible for the class who lived by their labour to be otherwise than degraded. It simply implied that the latter were to be educated merely as slaveholders, while the former were educated as slaves, and not as men. Thus was a right education needed, not merely to enable people to rub through the world, but for the purpose of raising the entire standard of life for the whole population.

METHODS TO BE USED IN TAKING QUANTITIES AND MEASURING UP WORKS.

BY THE MANCHESTER SOCIETY OF ARCHITECTS.

(*Continued from page* 156.)

Mason.

1. Plain ashlar walling and parpoint walling to be measured super, net work, for "stuff and work," giving the kind of face, and average sizes, and bed of the stones; allowance to be made where square blocks have to be cut to suit shaped openings, ramps, &c., and defining the number and dimensions of the through stones. Reveals to be measured extra. Rubble walling up to 18 inches in thickness to be measured superficial and described. Above that thickness to be measured in the cube and described.

2. Other masonry to be measured as hereafter mentioned, keeping the stone and labour separate, or when conducing to the better understanding of the work, as in strings, &c., to be measured in lineal feet, "materials and labour," with sufficient particulars to enable the number of joints to be included. Count the fair ends, quoins, &c.

3. Work in chimneys, or cornices, &c., requiring special appliances for hoisting, or at considerable heights, or of extra dimensions, to be kept separate, so far as the material, hoisting, and setting are concerned. The labour, when done on the ground, may be thrown in with the rest.

4. Under the head "stone" must be included the labour in hoisting and setting, and state approximately the quantity to be set above 40 feet from the ground.

5. Special appliances for hoisting, such as travelling cranes, &c., to be specially mentioned.

6. In measuring the cubic feet of stone for other than the work previously mentioned, 1 inch each way beyond the net dimensions of each block, when worked, to be added.

7. In measuring the labour, the necessary operations of the workman to be followed. The beds and joints of each block to be measured and kept under that head; and it will conduce to more easy pricing of the work when these can be given in lineal feet, with the average width, particularly for strings, cornices, architraves, jambs, &c.

8. The work exposed to sight to be classified under its different heads, mentioning whether bosted, tooled, or polished, and giving plain work, sunk, moulded, sunk and moulded (this when the straightedge will not work the block from a mould applied at each end), weathered, sunk and weathered, and the various kinds of fancy surfaces, and clearly distinguishing from straight work that which is raking, circular, circular on circular, &c.

9. Raised or sunk panels will require that face of the block to be first measured for plain work (for setting out on), then the face work, and the lineal feet of margin of its particular kind.

10. The points from which to girth moulded work will be best ascertained by a consideration of the manual process followed in its execution; in some strings it will thus have to be girthed from wall above to wall below; in other instances, as cornices, where the top is measured for sunk and weathered work, the moulded work will girth from the nose only.

11. All mitres to be counted, with the girth of the mould, &c., they belong to, and state whether internal or external.

12. Throats to be clearly given, either separately in lineal feet, where the soffit has been measured as a "bed," or, in other instances, girthed in with the moulded work.

13. The back of masonry will not generally require any notice, except where it shows through a wall that is not plastered, and in some quoins that bed more than the thickness of the walls, where the sinking must be taken into account. Tooling or rubbing backs of architraves, mullions, &c., to bed frames against, to be measured lineal, and all checking out for the same purposes to be measured in the same way.

14. Holes for flues, timbers, &c., to be counted.

15. Rough sinking down as a preparation for the carver to be given superficially, girthing round the cap truss, &c., &c.

16. All carving to be clearly set forth with reference to the drawings or special marginal sketches, running ornaments to be given lineal with the girth, but caps, bosses, trusses, modillions, paterae, &c., numbered. State if carver is to find his own scaffolding.

17. Ordinary window sills to be numbered, with dimensions.

18. Others than these to be taken cube, and the labour taken out as before, and in addition the seats counted for jambs, mullions, &c.

19. As tracery will generally be of a description between the work of an ordinary mason and that of a carver, the most satisfactory way would appear to be to measure one face over all the work as plain work for setting out on, and then number each piece of tracery with its dimensions and reference to the drawings or special marginal sketch for the remainder of the labour, but measuring separately any groove or rebate for glazing.

20. Mullions and other work with little material, as compared with the labour, to be measured lineal, "stuff and work," with particulars or sketch, and give general indication of the lengths.

21. Columns to be girthed for circular work (with or without entasis, as the case may be), and flutes measured lineal with sketch, and number of stops counted; if in extra lengths, keep both materials and labour under a separate head.

22. Rustics and other channelled work to be measured lineal (after the surface and beds have been fully measured) with sketch.

23. Cramps and dowels to be counted, with average size, or weight, if metal, and letting in and running; and state whether mason is to find lead.

24. Copings, where worked out of flags or thin material, to be measured lineal, and net as fixed, with proper description of each face and mode of jointing. All knees, apex, and foot stones to be counted, with sketch or particulars of labour thereon. Any perforations for flues, &c., to be counted.

25. Flagging to be measured net, in square yards, with proper description of materials, average and minimum size of flags, method of jointing and laying; and whether mason to provide bed and mortar, and if so, describe same. All exposed nosings to be measured lineal; and any perforations or notchings out to fit special corners or other objects, to be counted or measured, and the portion so notched out of any flag included in the gross measurement.

26. Flags, if required to be above 12 feet super, to be kept under the head of "landings."

27. Any special mode of jointing flags or landings, as lap or joggle joint, to be measured once along the joint.

28. Hearths to be given in superficial feet, and if the fore and back hearth be in one piece, state "large sizes," and count the notchings for jambs.

29. Paving to be measured net, with description of sets and method of laying, and whether mason finds the bed or not.

30. Keep each kind of tiling to floors separate, and state whether and what kind of bed is to be provided.

31. Band and gudgeon stones, codge stones, beam and pillar stones to be counted, with dimensions and particulars of work thereon, and whether mason has to let in and run any ironwork therein, or to find lead therefor.

32. Steps, where practicable, are best counted, with dimensions and particulars; solid steps may be taken lineal, with average length, and count the number for pinning in, and also the worked ends. All letting in of balusters, newels, &c., to be clearly given, and joggle or notched joints measured.

33. Landings, half spaces, &c., to be either counted with description or taken super, with all joints, worked edges, and soffits measured.

34. Letting in of grids to drains, coal-places, areas, &c., to be counted, and state whether lead to be found, and, if the stone or kerb has to be rebated, state so.

35. Area and other kerbs to be taken lineal, and, if cramped, so stated, with average lengths of the stone.

36. Dubbing out with flags, for cornices, &c., for the plasterer, to be taken lineal, with width and thickness, and any special labour.

37. Slopstones, &c., to be either counted, with particulars, or measured super with the labour. The sinking to be girthed bottom and sides each way. Mention the hole for grid, and whether to be fixed by the mason.

38. Mason's work generally requires very minute subdivision in measuring, and a knowledge of the method of working stone is essential to the proper performance of that duty. Each necessary operation of the workman should be taken into account, although it may appear that the same surface (as in

panelled or enriched work, &c.) has to be measured more than once for different descriptions of work.

39. Clean down and leave all perfect at completion, as an item.

Carpenter and Joiner.

1. Unless a special provision be made that timber and joiner's work must finish net to the dimensions given (the waste being calculated then in the price), it must be understood that all work will follow the original marking or "pricking" for sawing. Thus each sawn face would reduce the scantling by nearly $\frac{1}{16}$ in., or half the width of sawcut, and each wrought face would entail a further reduction of about $\frac{1}{16}$ in. A 12 by 6 in. scantling would thus measure $11\frac{7}{8}$ by $5\frac{7}{8}$ in. full, and a 2 in. door would finish $1\frac{3}{4}$ in. full.

2. Labour-framing and nails to be measured super, in square yards, for floors, roofs, and ceiling joists, keeping the different descriptions, whether for single-joisted or framed, separate, and defining the mode of framing, and taking the dimensions over the extremities of the timbers, or the timber may be taken cube and to include the labour.

3. Labour-framing principals to be measured the length of span, with wallhold, and separating the different kinds. The same with framing trussed partitions.

4. Ordinary studded partitions, and filling in to the above, to be taken super, in yards, for "stuff and work," with scantlings and distances apart.

5. Labour-framing hips and valleys, in lineal feet.

6. Gutters lineal, or if wide, super, and state if with bearers; count cesspools, with dimensions.

7. The timber to be taken cube when sawn to scantling, keeping, as far as practicable, large scantlings, as beams, purlins, large joists, &c., separate from small, as spars, plates, &c. Beams are best given in lineal dimensions, and, when over 35 feet long, should be kept separate.

8. When conducing to the better understanding of the work, however, large timbers, or those with special labour, to be measured lineal and properly described.

9. Deals, planks, and battens used for joists, &c., to be taken superficial or cube.

10. Planing or other special labour to timbers, measured super or lineal in feet, and stops to beads or chamfers counted.

11. All timbers to be measured net lengths as fixed, and trimmings for hearths, wells, skylights, &c., counted.

12. Angle beads, staff beads, and tilting fillets, in lineal feet.

13. Bolts, dogs, straps, &c., of iron, to be counted, keeping joint bolts separate from others.

14. Nogs and templates to be counted, or kept separate under a cube or lineal dimension.

15. Snowboards, in lineal feet, with width and description.

16. Ridge and other rolls, and hip and valley boarding, in lineal feet, with width.

17. Centering, in square yards, except centres for doors and window openings, &c., which are to be counted, with span and width. In extensive fireproof works, a small quantity of centering will often suffice if "taking down and refixing" be given, together with the necessary staying.

18. Cornices and face boards in lineal feet, with description and particulars of bearers, &c., and count mitres to the former.

19. Ordinary flooring in square yards net; mitred margins to be counted.

20. Pugging to floors, measure across the timbers and state description, whether on slabs and fillets, or laths, and if filled in, describe.

21. Skirtings in lineal feet as fixed, with dimensions and description, and state whether to include grounds; where above 7 inch, count all mitres and ramps, and labour housing to architraves, chimneypieces, &c.; if tongued to floor boards, state so.

22. Door casings and frames in lineal feet (allowing length for tenons, &c.), and state whether framed, and number of rebates; count frames for dowelling.

23. Doors, gates, &c., net size in super feet, allowing for rebate in folding doors, keeping each description separate, and state if flush-beaded at meeting edges, or for double margins, &c.; hanging to be counted and described, locks and other fittings at a price each, and labour fixing; bolts to dimensions, and ditto.

24. Architraves in lineal feet net measure, and state if with grounds, and, except for single moulds up to 3 inch, count all mitres, or special adaptations; blocks to be counted in pairs, including all labour fitting architraves thereto.

25. Window-sashes and frames to be measured full size of frames; if not square-headed, state so, or else count the heads for extra price, with description; state if extra strength be required in any part of frame, or any particular way of working weatherings, sinkings, &c.

26. Casement sheets and frames to be measured separately and as above, with scantlings.

27. State if holdfasts or other particular mode of fixing frames be required.

28. Skylights to be measured full size. Any portion of a sheet made to open, to be measured again in addition; if it is a separate piece of framing, and any grooving, weather fillets, &c., accounted for.

29. Window backs and elbows, and soffits, and linings, worked one side only, to be kept separate from shutters, and state if to have grounds; if linings are under 9 inches wide, take lineal, with the width. Plinths and capping and flush beads to be measured lineal. Hanging sheets and casements to be counted, with particulars of pulleys, cords, weights, hinges, fastenings, &c. Hanging shutters and backlaps ditto. Window bottoms lineal, and count returned ends.

30. Bracketing for cornices in lineal feet, with girth or sketch of brackets, and distances apart.

31. Coves, super feet, for stuff and work.

32. Cradling round beams, super, for stuff and work.

33. Bridging for floors in lineal feet, and state whether slab or herring-bone bridging, also whether tie-rod or hoop-iron is to be used.

34. Wall boarding and dados in super feet, and give lineal feet of grounds, and also fitting to architraves, &c.

35. All casings to underside beams, gutters, cisterns, &c., in super feet, with description, or else lineal, with girth and number of beads.

36. Pipe casing, ditto, and state if to be fitted with screws for taking down at pleasure.

37. The different items of water-closets to be kept separate, and state if fitted with screws, &c., to take down; seat and bearers, fall and frame, riser, all super; skirting, super or lineal according to requirements; capping separate. Holes cutting, falls hanging, hinges, paper boxes, &c., and attendance on plumber, to be counted.

38. For bath framing take riser and skirting as for water-closets; bearers for curb lineal; curb lineal, with average width, or super.

39. French polishing to be where practicable measured separately in superficial feet.

40. Fixtures require careful measurement in detail; skeleton fronts for drawers and small cupboard fronts separate from the fronts themselves; bearers, false bottoms, drawers fitting with stops, hanging doors, knobs, and other fastenings, divisions, guides, &c., all to be taken into account; shelves with widths and bearers or brackets, also hook rails, all lineal.

41. Stairs in ordinary cases to be counted, with dimensions, and state whether returned nosings and cut string boards, notched boards, and number of carriages; measure hand-rail, and balusters, and newels separate; and casing and nosing, hand-rails and balusters along landings; count ramps, scrolls, curtail ends, and circular corners to wells; give spandrel framing separate from square framed work; state french polishing; landings to be taken super in feet, including bearers, and nosings, &c., at the edge, to be taken lineal.

42. All other items of ironmongery to be counted, with particulars, or price and labour fixing in addition.

43. All circular work throughout to be kept separate from straight work.

44. Enter up reserved amounts, provisions of materials or cash, &c., and clearly state if such are to include contractor's profit or to be deducted in full.

45. The carpenter generally undertakes the fixing of the ironwork, and in many instances it might be desirable to put the fixing and staying during erection in his quantities, giving the weight of cast and wrought-iron beams, &c., and counting the bolts, rods, &c.

46. Insurance, if to be provided for by the carpenter, to be entered.

(*To be continued.*)

Bygones.

"*Antiquity after a time has the grace of novelty.*"—HAZLITT.

HAYDON ON WILKIE.

IN the diaries of the unhappy painter Benjamin R. Haydon there is constant reference to Sir David Wilkie, and although Wilkie followed in the steps of the Dutchmen, and was successful while his comrade was unfortunate in seeking after the impossible, yet Haydon always writes in a friendly spirit. It is natural that he should suggest how Wilkie's art was below his own and was not difficult of attainment, but no one will grudge poor Haydon the enjoyment of a little self-conceit.

After Wilkie's death there was an exhibition of his works in the British Gallery. What the professional critics thought of the collection can be derived from the article which was reprinted as a "Bygone" in *The Architect* of November 27, 1885. Haydon was roused by the supercilious treatment of his dead friend, and he wrote the following piece of criticism when the

exhibition was about to close, in which naught is set down in malice, although nothing is extenuated :—

An exhibition of the best works of a great artist after he is dead, at our British Gallery, is the last tolling of his funeral bell—the last effort of those who respected his character and wish to put the seal upon his fame, before leaving both to the unbiassed and sifting decision of a future generation. How must the artist and the public have been indebted to the British Gallery! How much the public taste has been solidly advanced by its various exhibitions of fine works! What good has been done, what knowledge has been indirectly inculcated! How greatly the standard of excellence in the country has been raised since these May displays began! What a study it is to look forward to! Now we have the majestic cartoons, then the crimson splendour and golden tones of Titian; now the pearly glitter of Veronese, then the startling dash of Tintoretto; at one time the gorgeous glory of Rubens and mysterious depth of Rembrandt, at another the sunny loveliness of Claude and savage poetry of Salvator; sometimes we are enchanted by Correggio, or instructed by Poussin: and then came the modern school—Reynolds, who might fear comparison with none for grace, for character, for taste, for touch, for gemmy surface, in portrait; for the quivering sweetness of children, and who was equal to all, and often superior to all, in the splendid depth and keeping of a background.

Gainsborough, with his sketchy richness followed, Hogarth with his blunt touch and bitter satire, and this year we have had David Wilkie, with his sound sense, his perspicuous conception, his beautiful composition, his natural expression, and his unaffected drawing—the founder of our domestic school.

In musing on the whole of Wilkie's works, from the earliest to the latest, there is the same sterling sagacity and sense; the story, the expression, the composition, never vary in intelligence or power.

His incessant changes of practice had something approaching to a feeble hallucination of intellectual power. Why a man so consistent and persevering, so unalterable and honest in one mode of conduct, morally, which founded his domestic fortune, should be so vacillating and uncertain, so childish and changing, so furious in the morning at the discovery of the previous evening, and so disgusted the next day at what he thought such a philosopher's stone the day before, is not to be accounted for but from some inherent imbecility.

The gem of this collection, without prejudice to others, is the *Card Players*, and here his practice was perfect—this is a work, in point of vigour, depth, daylight, tone, strength, touch, expression, finish, completeness, and life. No picture of the Dutch school, by Teniers, ever surpassed it in execution, whilst in point of story and sense, no picture by Teniers ever approached it.

I can tell the artist why this work is so extraordinary in power.

1. It is the only picture he prepared for ultimate glazing. Glazing softens and flattens, and if a picture to be glazed be not painted sharper in touch than nature, it will be flatter than nature when glazed.

2. He never lost sight of his ground in his deepest shadows, and finished his darks under the table and elsewhere by repeated thin glazings over each other, the ground always showing through.

Thus, in very early life, he hit on the system of Teniers; he hit on the principle of the Venetian, Flemish, and Dutch schools, though scumbling is more applicable to the two latter as an ultimate resource, and nothing could be so self-evident as the superiority of the picture or vigour, in spite of his greatest work (the Duke's *Chelsea Pensioners*) and his Murray group in *Knox*—one of the finest groups for everything in art the world can show.

In his early work, he ruined all colour by a large intermixture of a heavy and hot yellow tint in every portion of his work, with the single exception of a little picture he painted in Edinburgh, belonging to Dr. Darling—the *Village Politicians*. At the repeated entreaty of the late Sir George Beaumont, of Jackson and myself, he tried flesh without it, and the right hand of the *Blind Fiddler* was his first attempt. Yet it must be acknowledged he had no eye for colour; if he had had, he would have known when he had produced a fine tint, which he certainly did not, for after producing a fine tone you are as likely to find it ruined the next day; not like Sir Joshua, because he was longing for something richer, but because Wilkie's eye was never satisfied till he got some other tone not so rich.

The nonsense which has been written about him this season is melancholy. One man says he had no imagination, because he painted his bottles and pans from nature! Another, he had no genius, because he took so much trouble and made so many drawings of one thing, hand or foot! A third, that he painted circumstance and not character! What has imagination to do with a brass pan? What is wanted in a brass pan or a bottle is the reality of a brass pan and a bottle. That painting those things from the realities, instead of trusting to his memory, argues no imagination, is rather refined. Again, as to his taking trouble, who took more trouble than Raphael? Had he no genius because he took trouble to be perfect in comprehending the objects to convey his thoughts? "Draw the naked figure first," said a connoisseur to a young artist, "as Raphael did." "Oh," said the young man, "that would be losing time." No, my young friend, it would be gaining time and not losing, and when fresco begins you will find it out.

The *Breakfast* is another of his best works, and perhaps the servant-girl pouring out the water is more like a woman than any other he ever painted of that beautiful sex.

Thus then for ever ends the exhibition of a collection of this extraordinary man's works. His genius first startled the school from its slavish imitation of Reynolds; and though a great era is commencing—that era which I have always foretold and laboured hard to produce—I can imagine no period of excellence that may hereafter arise wherein the works of David Wilkie may not be studied with benefit and instruction either for fresco or oil.

Poor Sir David! How many days we have passed in early life! After painting all day, we met at dinner, and hurried to the Academy from six to eight; then went home to each other's rooms to criticise and advise on our mutual labours, animating each other with fresh hopes, and parted for the night with ardent aspirations for fame and distinction. Lord Mulgrave was our employer and kind friend; at his table we used to meet the first men of the time. Lord Mulgrave was a noble character, and had great delight in the society of artists and connoisseurs; after the fatigues of office nothing pleased him so much. What reminiscences I could write! What a guide-book for students would our mutual lives be, our mutual hopes, our mutual anxieties, our mutual fears, our mutual victories, our mutual defeats. A frequent guest was George Colman, whose wit and fun were perpetual sources of sparkle. Lord Mulgrave's brother had attempted to discover the North Pole; a series of pictures relating to the attempt hung round the dining parlour. Before leaving the room long discussions used to take place on art, the whole party walking round. In Captain Phipp's hand was shown a boat hook; Sir George Beaumont said, "What has he got in his hand?" "Why," said Colman in his burly joking voice, "I take it to be the North Pole!" At another time, after dinner everybody at table seemed sullen and indigestible—we had been painting all day, and were exhausted. Lord Mulgrave was exhausted and said nothing, and there was silence so long, that all of a sudden the whole circle made a sort of spasmodic effort to say something. Sir George in a lazy sort of a way observed, "Theodore Hook is a delightful fellow." "Is he?" said Lord Mulgrave, with a look at us all, "I wish to God he was here now." This put everybody laughing, and the whole evening was delightful.

The going to the Academy every night we always considered a necessary winding up of a day's study, but the theatres Covent Garden and Drury Lane were sources of dispute. When Mrs. Siddons acted I used to appeal to Wilkie, and when it was "Mother Goose" he used to dwell on the bill, and insist he wanted to study the expressions in the pit. Sometimes he saved me from temptation, and sometimes I saved him. Once in going home through the Piazzas there was a show; a man in a thundering voice was explaining its wonders. As if by instinct we squeezed in, and, getting up in a dark corner, hoped not to be seen. At last in dropped, one after the other, sixteen students. Long before they were all in, recognition took place, so that a hearty shout welcomed every new face, to its utter dismay. Many of them are now living—the most distinguished artists of the day. The show was "The Baker and the Devil," and it is impossible for people who are never worn out by ten or twelve hours' painting to comprehend the relish of students for such absurdities.

To travel with Wilkie was entertaining. In 1814 we went to Paris, and saw the town in its glory. We were joined by a Lincolnshire gentleman, who added much to our pleasure, and the only time I ever saw Sir David yield to a true "abandon" was coming out of Rouen. Champagne had got to his heart, and opened its natural sources. We were in an open carriage, and I proposed we should sing "God save the King" as we left the city. Wilkie joined most heartily, and, on passing into the road, an elegant Frenchman and two graceful women stopped to look at us with pleasure and astonishment. As we concluded the last line he turned from us smiling, and said, "Ah! *trois milords.*"

But enough. When a dear old friend goes first in the maturity of life, one is apt to dwell too long on days which are passed for ever.

The Library Committee of the Corporation of London have ordered three pieces of tapestry, at a cost of 1,000*l.*, from the tapestry works at Windsor, to be hung in the Egyptian Hall at the Mansion House. The subjects represented will be commemorative of some prominent events in civic history.

Correspondence

A National Art Exhibition.

SIR,—Since the proposal for a National Art Exhibition was first made public much discussion has ensued. The action of the Royal Academy in the conduct of its exhibitions and in its relation to the arts generally has been almost unanimously condemned, and the need that art matters should be organised on a just basis has been practically admitted by all.

The Royal Academy is evidently not disposed to move in the matter; therefore the remedy must be sought outside that body. The justice and fairness of the proposals which we enclose are evident. That they are practical is shown by the amount of support already received from artists.

As this matter is neither private nor personal, but one which is admitted to be of public importance, we take the liberty of asking you, sir, to give publicity to this scheme. May we also ask those willing to forward the movement to communicate with Mr. J. H. Thomas, hon. sec. *pro. tem*, Wentworth Studios, Manresa Road, Chelsea.—We are, sir, your obedient servants,

GEORGE CLAUSEN.
WALTER CRANE.
W. HOLMAN HUNT.

September 13.

National Art Exhibition.—Programme.

First obtain guarantees for money top ay expenses before and during exhibition. In the event of the exhibition not being self-supporting, the deficit will be met by a *pro ratâ* call on the money guaranteed—*i.e.*, each guarantor will lose from the sum he guarantees the proportion that the deficit bears to the total amount guaranteed.

For example, if the total amount guaranteed is 500*l.*, and the deficit to be met is 100*l.*, each guarantor will lose one-fifth of the sum he guarantees.

If the exhibition pays expenses, the money advanced by the guarantors will be returned.

If there is a balance, it will be carried forward to next exhibition.

The functions of the managing committee (elected from and by the money guarantors) to be quite separate and distinct from those of the artistic committee, the latter to have the sole and only voice in selecting and hanging the works of art submitted to it.

When there are sufficient guarantors, a circular explaining the "movement" will be sent at once to the suffrage, and every effort made to advertise to voters and general public.

The suffrage to be as wide and as universal a suffrage of all ranks and conditions of artists as possible, without discrediting the suffragan voice.

Let us say every artist who in the last two years has exhibited a work of art in any of the principal exhibitions. Let us say for "principal exhibitions" the different widely-known existing art societies, and the exhibitions managed by the municipal corporations of the provinces.

The circular to be an explanatory programme, saying very distinctly that the voter to whom it is sent will have no pecuniary responsibility, and asking:—

(1) That the voter will submit two works to the selecting and hanging committee for exhibition.

(2) That the voter will send in his name as a candidate for the selecting and hanging committee.

(3) That the voter will vote the names of twenty for the selecting and hanging committee.

Then explain that these twenty will be chosen from a list of the names that are given in response to paragraph (2). That this list will be sent early next year.

Then early next year this list of names collected, as above, will be sent to the suffrage, and by its vote will be annually chosen the selecting and hanging committee of twenty.

REVIEWS.

TRUSSES OF WOOD AND IRON. By WILLIAM GRIFFITHS. Published by the Author at 9 Heathbank Road, Birkenhead.

It is often objected by students of construction that the information contained in books is too general for their purposes. The deficiency can be made up with the aid of a teacher, but in the majority of cases that aid is not forthcoming, for the students must be self-taught, if taught at all. The little book by Mr. Griffiths is on the opposite principle—of "a little but well." He takes four roofs of common types and works out the strains on all the members, the graphic system being adopted. Every step of the process is accompanied by explanations of the principle involved. Many students who are perplexed in applying the few formulas usually given will by the use of this book find the way made clear. For those who are preparing for the examinations of the Science and Art Department this method of going through the whole process of discovering strains must be of great use. The diagrams are on a size that is large enough to allow the strains to be taken off by a scale. From the manner of treating the subject, Mr. Griffiths's book is clear enough to enable a student to be his own teacher. It will be useful in the science school and in workshops.

PRACTICAL GUIDE TO PHOTOGRAPHY. By MARION & CO. New Edition.

Messrs. Marion & Co. hold the first place among manufacturers of photographic apparatus, and their business extends to most parts of the world. The guide which they publish is as full of practical advice as might be expected from authors with so wide an experience. It is their interest to diffuse information, and in consequence a beginner will often in the "guide" find hints on practice which are not to be found in all books. The directions are given in such plain language that any tyro can comprehend it, and from the explicit treatment of the pages we expect to see photography become more popular than ever. In the part relating to photography of buildings we find the following announcement:—"The use of photography by engineers, builders, &c., for keeping records of their work and so forth, is now so much on the increase that we have thought it advisable to set up a special set for their use. This we have called 'The Engineers and Builders' Photographic Set.' There is contained in it complete apparatus of a substantial and efficient nature for taking negatives of any size up to 12 inches by 10 inches."

GENERAL.

A National Exhibition of Fine Arts is to be opened in Venice next April. English artists residing in Italy can exhibit.

Two Stained-Glass Windows have been erected in Kirkaldy Church. They were executed at the Merton Abbey Works, from the designs of Mr. Burne Jones, A.R.A.

A Statue of "Britannia," by Mr. Rhind, of Edinburgh, has been inaugurated at the Perth Academy buildings. The cost of the statue and a clock amounts to 500*l.*

The Guildhall School of Music on the Victoria Embankment is to be opened at the end of the month.

A Small Hospital is to be erected at Johnstone, N.B., and the Hospital Board have resolved to advertise for plans.

The Church of the Holy Trinity, Avenue de l'Alma, Paris, erected from the designs of the late G. E. Street, R.A., under the direction of Mr. Arthur Street, M.A., and Mr. A. W. Blomfield, has been opened this week.

Mr. John Chalmers, architect, of Edinburgh, was on Monday elected Superintendent of Works for Perth, in place of the late Mr. George Wells. There were ninety-eight applications for the appointment.

The Education Department authorities have sanctioned a grant of 188*l.* 5*s.* for the purchase of casts for the Liverpool Corporation permanent collection.

A Meeting to oppose the building of a town-hall for Lambeth was held in Kennington on Tuesday.

An Anonymous Donor has given a sum of 1,500*l.* for the erection of science classrooms in connection with Paisley Grammar School.

The Spire of the parish church of Llangrove, near Monmouth, has been wrecked by lightning, and will need rebuilding.

Sir John Kelk, Bart., died at Tedworth on Sunday. He was well-known as a contractor in connection with Messrs. Lucas, and the Exhibition buildings of 1862 were among the public works carried out by the firm.

The Albert Bridge over the Lagan, Belfast, which was erected in 1831, collapsed on Wednesday evening with a great loss of life.

The Plans of Mr. Jethro A. Cossins, of Birmingham, have been approved of for the proposed public buildings at Darlaston.

The Dundee Police Commissioners have decided to proceed with the extension of the Esplanade a quarter of a mile. By this work a large portion of the river on the south of the Dundee and Perth railway line will be reclaimed, and upwards of sixteen acres will be added to the Magdalen Green recreation ground. The cost is estimated at 15,000*l.*

Monte Testaccio.—The mound in Rome near the gate on the road to the Pyramid of Cestius and the Basilica of St. Paul derives its name, the hill of potsherds, from the immense mass of fragments of broken pottery, of which, during centuries, it was built up. Many valuable relics of antiquity, and of later times also, have been found there in excavating sites for wine cellars and similar cool receptacles. Quite lately two beautiful ancient vases were found, the one filled with lentils, the other with aniseed. Pieces of ivory have sometimes been found, but they were practically useless from the effects of damp.

The Architect.

THE WEEK.

THE competition for the New Barony Church, Glasgow, has been decided on the report of Mr. J. L. PEARSON, R.A. The successful plans are those submitted by Messrs. JOHN BURNET & SON. The premiums referred to in the conditions have been awarded to Messrs. LANDLESS & CLIFFORD, Mr. J. B. WILSON, Mr. JOHN HUTCHISON and Mr. JOHN HONEYMAN.

THE Leeds Corporation have yielded to pressure from some of the members, and the competition for the art gallery, which is to cost 8,000*l.*, is to be thrown open to the world. It is not a wise arrangement. The commission is not of great value, and it is only a resident in the town who will be able to derive advantage from the work. A case of this kind displays the weakness of an architect's position. The invitation of the Town Council to the Leeds architects was tacitly an agreement, but they had not written in return stating their acceptance of the conditions. There is consequently no case against the councillors. Will the Institute of Architects take any notice of the affair? The Leeds Society came to its aid at a time when the provinces were ready to revolt against the mismanagement in Conduit Street, but gratitude is not one of the virtues of the Institute.

THE series of paintings by LEBRUN, which glorify LOUIS XIV. under the title of ALEXANDER THE GREAT, have been hung at a height in the Louvre which makes it impossible for an ordinary spectator to appreciate their qualities. LEBRUN has been long under a cloud, and this was typified by the neglected condition of his paintings. The new officers of the gallery are showing their energy by altering the positions of many of the works, and are imparting an air of novelty to the walls. LEBRUN has been the gainer under the new conditions. His pictures are rehung with some of the best works of his contemporaries, and it is now seen that he is one of the artists of whom Frenchmen may be proud. From his *Victories of Alexander* students can learn much that will be useful.

MR. G. G. HOSKINS, F.R.I.B.A., has been commissioned by Lieutenant-General Sir HENRY MARSHMAN HAVELOCK-ALLAN, Bart., C.B., V.C., M.P., to carry out extensive additions and alterations to Blackwell Grange, near Darlington, formerly the principal seat of the ALLAN family, and inherited by Sir HENRY under the will of his relative, the late Mr. ROBERT HENRY ALLAN. The style of the mansion is Queen Anne, and it appears to have been erected at three different periods, the earliest during the latter part of the seventeenth century, and other portions early in the eighteenth century. Blackwell Hall, another estate inherited by Sir HENRY under the same will, was considerably enlarged and altered about two years ago, from the designs and under the direction of Mr. HOSKINS, and is at present the northern seat of the hon. and gallant member for South-East Durham.

"TOUCHINESS" has been added to the list of sins by an English bishop on his own authority, and Government officials of high standing appear to be subject to it whenever there is a suspicion of an invasion of their privileges. To find all civil servants working together for the common good we must go to Utopia. The Prisons Board of Ireland is now like the fretful porcupine, because it is proposed to erect a convict prison in Galway, and to employ the Board's prisoners in the construction of a breakwater. The Prisons Board has not been consulted on the affair, and an impediment is thrown in the way of the scheme by saying there are not enough convicts for the work. In England we are regaled every morning with stories of Irish crime, but the Prisons Board having taking count of its interesting clients finds there are only 250 convicts available. All the rest are invalids, eccentrics, probationers, and "fatigues," or are ministering to those classes. The Government has acted on the assumption that an unlimited number was available. A Government commissioner was sent to Galway to select a site, a Government sanitarian followed to see if the site was healthy, a Government architect and a Government professor of engineering were commissioned to make preliminary arrangements and discover a water supply. A Government chemist was called in to test the supply, a Government medical officer was summoned to discover if there was anything in the supply that chemistry could not discover, a Government arbitrator arranged with the owners of the supply, and a Government solicitor has approved of their titles. One's brain is puzzled in attempting to calculate the quantity of red tape and foolscap that must have been consumed in these scientific, legal, and diplomatic operations. But all the time nothing was thought about the hands that were to execute the wonderful works. The Treasury is, however, about to advance 10,000*l.* to pay the expenses of workmen that do not exist even on paper, and some outlet will be discovered for the money. Need we wonder if in Ireland people believe the English exchequer is unlimited?

A REMARKABLE return has been presented to the House of Commons, showing the amounts of loans and advances from the Imperial Exchequer for Irish purposes since the Union. It appears that the Board of Public Works in Dublin obtained 34,240,831*l.* in advances. Of that amount, which was a debt, nearly one-fourth, or 7,953,366*l.*, has been remitted. A large part is, of course, owing to the difference between the estimates and the actual cost of the arterial drainage works. In order that the people might find employment, plans and estimates were prepared in a hurry by engineers who were without experience, and in several cases the cost exceeded all anticipation. There were doubts about the power of the Government to recover more than the amount in the estimates, which were the basis of the agreements with owners and occupiers. In some districts not more than one-half the cost was charged, the remainder being made up from the Exchequer, and cases could be cited in which there was a much larger percentage of loss. In one district the estimate was 8,850*l.*, while the Board of Works paid 24,055*l.* If the discrepancies occurred in buildings there would be no end to the outcry.

M. GOBLET, the French Minister who is responsible for art, religion, and many other things, has received a good deal of abuse from time to time because he is supposed to know little about the subjects he controls. But he has just made one appointment which suggests that he is wiser than the journalists believe. An archæological mission is about to be sent to Greece and Asia Minor. M. GOBLET has placed M. GUILLAUME, the sculptor, at the head. It is not every Minister who would have the courage to employ one of the first sculptors in France for such a post; but M. GUILLAUME has shown his fitness for reporting before now. We hope he may be rewarded by discoveries. The contest between France and Germany can be fought in many fields, and it is praiseworthy to seek an opportunity of eclipsing the glory which has accrued from the Olympian discoveries. England is of course unrecognised in questions relating to archæological research, but some century hence we may have the courage to rake among the *débris* of the excavations of other countries.

THE paper on defective eyesight and deafness, which was read by Mr. JOHN OAKLEY, M.R.C.S., at York, is worth attention from managers of schools. Mr. OAKLEY says that one of the causes of slight deafness arises from variations in the temperature of the rooms. As a rule they are generally too warm; then the children are turned out into the playground in all weathers, with insufficient clothing and no covering to the heads, and the weakly children are as a result frequently suffering from catarrh. The prevalence of myopia was ascribed by Mr. OAKLEY to close application in early life and strong mental effort. He said that all children who are defective in vision should have special attention given to the postures in which they work. The desks should be so constructed that the child can sit with shoulders square, the work exactly in front, and the eye at least twelve or fourteen inches away. The light should be good, and if possible proceed from the left side.

THE ROYAL ACADEMY AND EDUCATION.

IT would appear from what is being said at the present time by reformers that it possible to arrange the Royal Academy in such a way that a young fellow, having only an elementary knowledge of art, can be put into the schools, and after a certain definite time he will be turned out a perfect painter, sculptor, or architect. We have grown so familiar with the processes of machines, it is not surprising if we think the human mind can be subjected to operations with as much certainty of result as a bale of cotton. The founders of the Academy did not propose to accomplish such wonderful feats. In spite of the royal support, they took a humble estimate of their powers. "We can teach you here but very little," were REYNOLDS's words, and the end of the instruction in those days was simply to enable the students to admire the works that were worth their admiration. When people say the Academicians have failed to carry out the intentions of King GEORGE, it would be well for them to direct their thoughts for a while to the early history of the Academy. It is sufficient by itself to show that the Royal Academy was not founded in order to enrich the country with a large number of immature artists.

Indeed, REYNOLDS seemed to think that there was a disadvantage in having a school like that belonging to the Academy, where so many facilities were given for study. He knew by heart the histories of the great artists, and remembered that their paths were not always along level ground. He therefore pointed out that the conveniences for study which were before the students were likely, from leaving no difficulties to be encountered, to have a deleterious influence. In the homely way that was familiar then he reminded his auditory that there were certain animals who refused to touch food when there was abundance before them, but were eager whenever the food was reached with difficulty. As for those students who were embryo system-mongers, and eager to follow a "course of study" on a philosophic plan, REYNOLDS had little hope of their sincerity. The words he uttered more than a hundred years ago are deserving of attention just now, when there is so much faith in the power of educational processes to lighten labour. "I have always strongly suspected," said REYNOLDS in 1784, "that this love of method, on which some persons appear to place so great dependence, is in reality at the bottom a love of idleness, a want of sufficient energy to put themselves into immediate action." Education with REYNOLDS, as with the philosophers of an earlier age, was an individual affair, and required efforts of a painful sort which could not be evaded by any plan that a *doctrinnaire* could devise.

It is evident that the first Academy professors and visitors were willing to admit that their power for good was limited, for otherwise they would hardly stand all that was said on the subject in the presidential addresses. REYNOLDS evidently thought that the best professor was only a sort of sign-post. Most people err, he said, not from want of capacity to find their object, but from not knowing how to pursue it. The teacher was to indicate in what direction they were to run. In another place he tells us that "the most skilful master can do little more than put the end of the clue into the hands of the scholar, by which he must conduct himself." King GEORGE and the professors do not appear to have been annoyed at so low a view of the teacher's office. As for the worthies who professed to be able to do more, the President warned the students against them. "In this art as in all others," he said, "there are many teachers who profess to show the nearest way to excellence, and many expedients have been invented by which the toil of study might be saved, but let no man be seduced to idleness by specious promises."

In that antiquated age people were unaware of the virtues of the modern process of cramming, by which so many men have been qualified to hold lucrative and influential positions in our time. REYNOLDS was simple enough to believe that a student could find no better teacher than himself. "We all must have experience," he said, "how lazily, and consequently how ineffectually, instruction is received when forced upon the mind by others: few have been taught to any purpose who have not been their own teachers." In saying this the President did not exclude those supposed secrets of painting which, according to Mr. HOLMAN HUNT, are among the traditions that the Academicians have dropped. "An eye critically nice," he says in one discourse, "can only be formed by observing well coloured pictures with attention; and by close inspection and minute examination you will discover at last the manner of handling, the artifices of contrast, glazing, and other expedients by which good colourists have raised the value of their tints, and by which nature has been so happily imitated." REYNOLDS believed that it was not more practicable to obtain knowledge in painting without a close study of pictures, no matter how many might be the harangues to which the student had listened, than to be a scholar by listening to lectures without reading books. He praises MICHEL ANGELO and RAPHAEL, not because they were assiduous students in classrooms, and had there acquired knowledge, but because they knew everything that was to be derived from the works of their predecessors.

It will hardly be credited that the dream of REYNOLDS, when the Academy was established, was not to have an army of professors with eloquent tongues, but to possess a large collection of masterpieces in painting, which the students could study—in other words, to create a National Gallery. This, however, is plain from his first discourse. After he had paid compliments to the King as founder, REYNOLDS set about explaining the meaning of the new institution. If the Academy corresponded with the schools which it was to supersede, he need hardly have taken so much trouble. But the new Academy differed from its predecessors in London, because it was to be "a repository for the great examples of art" in which they were deficient. And then REYNOLDS went on to explain how many men with great abilities were lost to England because they were not fortunate in having masterpieces before their eyes. Teaching was to be had, and Mr. HOLMAN HUNT is probably correct in saying that it was better than the Academicians', but there were no pictures of value in the other schools. The characteristic that was to be predominant in the Academy is also suggested by the way in which REYNOLDS met the objection that RAPHAEL had not attended an Academy. "All Rome, and the works of MICHEL ANGELO in particular, were to him an Academy," he replied, meaning that the city was also a repository for works of art, as, by royal favour, their Academy would be in course of time.

For REYNOLDS and the men of those days had a faith in the power of a good picture which now must seem to savour of a superstition. He believed it was possible by the mere sight of a masterpiece to "receive the principles which many artists have spent their whole lives in ascertaining." What happened to RAPHAEL might be their case, and as he became competent to work in the grand style from seeing the Sistine figures, so the students might also hope to acquire a noble manner from seeing the King's pictures every day.

REYNOLDS must surely have known something about the King's desire, and he was too good a courtier to say a word that would not correspond with the founder's intention. When, therefore, Mr. HOLMAN HUNT tells us that "the Royal Academy must be made somehow to fulfil the laudable intention of its founder, GEORGE III., not in word only but in the very spirit of our day," he must be aware that REYNOLDS is entitled to be considered as the exponent of the King's opinion, and the President was not an advocate of a school in the spirit of our time. We are not so vain as to believe that we are competent to interpret fully what that spirit is; but, apparently, there is a desire to have many teachers, who are to impart information in the easiest way and in the shortest period. Our time insists on short cuts to knowledge, and is adverse to an uphill road. Now, there never was a man more opposed to that way of becoming an artist than the first President of the Royal Academy. Some students, he said, are always talking of the prodigious progress they should make if they could only be taught by some particular eminent master. But, according to REYNOLDS, the disposition to lean on other men is only a sign of sloth; for such students wish to transfer to their master that care which they must take of themselves. King GEORGE's President deserves to be recognised as the advocate of self-reliance among art students. His "Discourses" may now be out of fashion, except as formal premiums in the Academy; but at a time when so

much is being done to upset the principles on which the school was based, and when art students are all treated as if they belonged to an effeminate race, they deserve to be again accepted as "golden precepts."

It will be said that the French Academical school—the Ecole des Beaux-Arts—is conducted on a different principle, and that, owing to the number of professors, it is a sort of university of art, and it is proposed for imitation in England. The success of the school is not universally admitted in France, and at the present time there are many artists who are advocating its abolition. It certainly does not owe its position entirely to esteem for the teaching. The school is really what REYNOLDS'S Academy was in theory—a sort of half-way house on the route to Italy. Take away the Prix de Rome, and the Ecole des Beaux-Arts could not long survive. The students who wish a residence in Rome have to attend in the Rue Bonaparte, and make a show of receiving instruction from the professors, but there are few of them who are not pupils of painters without any official position, and it is often in humble studios that the instruction is received which is put in practice in the competitions of the Ecole des Beaux-Arts. In government and municipal offices a good deal of importance is naturally attached to education which has the official stamp, and therefore the Ecole des Beaux-Arts will always have plenty of pupils. The public in general pass a very different sort of judgment on the school, and the newspaper critics try to please the public by ridiculing the works of the men who gained honours there. A few years since one of the journals, in describing the *Salon*, passed over many works by simply saying of each it is the work of a Prix de Rome. It was thought unnecessary to point out defects which were supposed to be inevitable with all students of that school.

What REYNOLDS and the founders of the Academy said about painting is even more applicable to architecture. The President's words, "We can teach you here but little," should be inscribed in every architectural school, in order that the students may not be inspired by delusive hopes. There are so many disadvantages accompanying the putting of architecture in connection with painting and sculpture, that one might doubt the wisdom of the association, if it had not been determined by a king. Professor COCKERELL was not given to speak rashly; and when he asserts that a great error of the English school of architecture may be said to have arisen from the juxtaposition in the Academy exhibitions of architectural drawings with paintings, we get a key to many difficulties. One is the risk of leading students to believe that architecture is simply an affair of draughtsmanship; and therefore COCKERELL quoted with approval the saying of PHILIBERT DE L'ORME, that those who amuse themselves with making pretty drawings only are those who least understand the real art and science of architecture.

We can understand the rulers of the Institute of Architects trying to make it appear that the blame for what Lord GRIMTHORPE calls the "no education" of architects rests with the Academy. If a mode of education is necessary to supplement or to supplant the training received in an architect's office, it should have been long ago initiated by the Institute. The Secretary may hint about a great and wide-spread evil, and the impossibility of saying all that ought to be said on the subject, but he must know that the Council of the Institute has not had the courage during the last fifty years to offer any suggestion to the members about the education of their pupils. "I believe," said Sir GILBERT SCOTT, "the founders of the Institute had some intentions of establishing artistic training, but I doubt very much whether it will ever be done." The sneer that is in the words was not undeserved. The Academy may be defective, but it cannot be charged with broken promises. In its records there is nothing corresponding with the declaration that was made at the opening meeting of the Institute, about having ample provision for the general information and improvement of the junior class. Whenever education is the subject, it behoves an officer of the Institute to be silent, for there is something comic in a representative of the Council posing as an advocate of an extended training in either science or art. In respect of education, the Institute has loyally followed the example of the trades unions.

The clamour for reform may induce the Academicians to make many changes. It is advisable to limit the claims of the members on the wall space of the exhibition, but in dealing with the schools there is much to be said in favour of a retention of the original principle on which they were established. As we have tried to explain, it was not intended to imitate the ordinary colleges by setting up a staff of professors. REYNOLDS, as we have seen, explained that teaching of that kind was not requisite in art, and his view has been adopted by other presidents. "What you cannot learn from his pictures," says SHEE, "the painter will in vain endeavour to impart. The candid painter will confess that he has but little to impart; he cannot inoculate his taste or transfuse his feelings. Whatever he values in himself he knows to be beyond the power of words to communicate; what he possesses he knows to have been obtained by self-effort, and to be attainable by no other means." The best students of the Academy have been those who agreed in that belief, and recognised the fact that it is by a study of works of art, and not by discourses upon them, that artists are made.

ARCHITECTURE AND SCULPTURE IN FRANCE.

IT has been often alleged that English architects do not care to patronise the sculptor's art. The public buildings that are without statuary are evidence. Gothic architecture, it is said, depends for much of its effect on statues; but how many are to be found in a building like the Law Courts? The very few figures that are visible were obtained, we believe, without any sum being entered for them in the contractors' schedules. Mr. Street adopted a give-and-take principle, and was obliged to effect a saving in order that a mason might hew such a figure as the *Lawgiver* that is seen in Carey Street. Public authorities have yet to be educated to a belief in the necessity for sculpture, and meanwhile architects must be under the accusation of being indifferent to the use of what Wotton calls "the natural and suitable ornament" of their buildings.

In Paris the architects are just now rather excited about an article by M. Adolphe Racot on the triumph of flatness. The writer argues that the modern public buildings in that city want sculpture, and therefore fail in some of the principal purposes which works of the kind should subserve. M. Racot believes that the general public is unable to appreciate architecture, however pure it may be, unless it is aided by figures. We give a translation of his article, which will enable our readers to understand his argument. One question must arise—If Frenchmen, among whom more or less knowledge of art is disseminated, cannot admire a building that lacks sculpture, what is to be said of Englishmen?

Some years ago, says M. Racot, the City of Paris acquired an eighteenth-century house in order to convert it into an establishment for public instruction. It was one of those old dwellings that are so deserving of admiration on account of the immense *salons*, the high ceilings, and the large windows that are never to be seen nowadays unless in engravings of that date. The windows had round heads and the eye was gratified by the charming sculpture in them, as well as by the sculpture of the panelling in the rooms, for as yet a mode of luxury that is at once ostentatious and economical had not thought of introducing a wall-covering which, as it makes all rooms become alike, is a means towards equality.

It was necessary to alter the most beautiful of the *salons* into a classroom. Sculpture which is in high relief stands in the way of such a transformation. So the panels were turned out and then all went well. A note of discontent was heard. Among the band of utilitarian architects there somehow was placed one of those men who look kindly on the past, and who believe that we ought to conserve as far as we can all it has left us that is good, including the elegance, the grace, the charm of things, qualities which in the modern desire for equality are not recognised, and are even abolished. He ventured to remark in a melancholy tone:—"I regret the sculpture. The sight of a good bit of that kind of work, on the panels of a door or of a wall, may do more towards the education of a young mind and soul than lessons in grammar or geometry."

It seems to me that what was said on that occasion about the carved wood expressed the idea that was uppermost in the minds of statesmen who wished to be rulers of men, in those days when the passion for equality had not brought everything down to a dead level, and when life was less wearisome than it is now. I firmly believe that when the first great buildings of France were ordered by Sully, and when under Colbert the Paris of Louis XIV. arose from the ground, and presented to the gaze of everyone, to the barefooted mendicant as well as the workmen, to the shopman and the shopkeeper, its architec-

tural masses; when the artists in stone had shown their fertility of fancy in colonnades and bas-reliefs, there was something else in view than the desire to appear great. There was also a resolve to create beauty, in order to introduce and to uphold constantly in the imagination of the people, and especially among the young and the ignorant, that good taste which is the source of so many things.

If a fine piece of carving on a door is able to arouse the sentiment of taste in a simple mind, as I believe it can, was it not wise to impress powerfully the imagination of our fathers by placing before the crowd at almost every step a masterpiece of art, and in default of masterpieces, to have in modest buildings something that might speak to the eyes and afterwards to the feelings?

If to-day water is required in one of the public squares, taps of brass or bronze are fixed on the conduits, and the material need is satisfied. In the times of François Miron, of Colbert, and of Marigny, there was not a fountain set up at the corner of a street without the ædiles of Paris calling in an artist to carve a bas-relief upon it, or at the least, some imaginative head.

On looking around the new Paris—that is, the Paris constructed within the last fifteen years—I see in public buildings and memorials evidence of what I must call an aversion to sculpture: in other words, I witness the triumph of flatness. There is nothing for the imagination, nothing to attract, nothing that seems to smile, nothing in fact to please the eye. About a century and a half ago a monument of public utility would open a career to artists, and it was a theme for their ambition and zeal. Who has not seen in most of the large towns of the provinces (for in those days Paris had not the monopoly of monumental works) buildings of the age of Louis XIV. and Louis XV. which show that the architect was then always accompanied by the sculptor, and in which the ornamentation strikes the spectator no less than the harmony of the structure?

Let us suppose that in the time of Coustou and Coysevox it was proposed to erect an immense post-office. We can easily imagine what a palace would be the result, and how we should have allegorical groups, and horses with broad chests and expanded nostrils of that kind of which the two great sculptors have happily left us types in Paris and elsewhere. If likewise, the Ecole de Médicine were to be rebuilt in those days, the first care would have been to disguise the sadness and melancholy inseparable from such an institution by a profusion of artistic decoration.

We have a new post-office and a new Ecole de Médicine. Space has not been spared in them. The architects have had a clear field. If we stop before the buildings, we are sure to say they are great and vast. But we see nothing to gratify the sight, nothing that will aid in the education of the ignorant, who should feel something else beside *ennui* in gazing upon a public building. The walls are smooth, polished, and massive, that is to say, flatness is everywhere.

Is it by accident that the art which formerly belonged to all, of which exemplars in marble, in bronze, and in stone were disseminated throughout Paris in order to uphold some sense of pride and admiration in the hearts of the most humble folks, that all of a sudden this art, owing to a system of equality and democracy, is reduced to be a hanger on of luxury, so that rich men alone are henceforth to patronise it, and sculpture is only to be enjoyed by a few in private mansions and parks? We may well believe this when we see the kind of buildings that are erected for palaces, the barracks, and penitentiaries that are built to lodge men who are free, and especially when we see everywhere the naked walls, the perpetual flatness, the everlasting straight lines without any kind of relief, and of which the monotony contributes to the lassitude and nervousness of a people deprived of an ideal.

Art has no longer a place in our social organisation, probably because it leads to dreaming; and since M. Goblet the Minister has never dreamt in his life, he probably does not wish anybody else to dream. It is now the turn of science, who appears in the person of a bold engineer and cries out, "I can also do something great, for I am able to build a tower that shall be lost in the clouds." This engineer is called Eiffel. The illustrated papers have given the plan, the section, the elevation of this monument before any part is constructed. It will be of course in steel, iron, and bronze, for science slights marble as too fragile. Well, I bow before this engineer. While flatness reigns everywhere, he at least has had the courage to create something elevated and developable, which mounts and astonishes. But I am not going to offend M. Eiffel by adding that if for the construction of his tower, for its detail, for its general effect he could utilise the skill of Bisconnet, who wrought the ironwork on the door of Notre Dame, and of Benvenuto Cellini, who, like M. Eiffel, worked in metals, then his work would be improved. Unfortunately both craftsmen are dead.

When that portion of Paris was created which comprises the Rue Royale, the two colonnaded buildings of the Ministry of Marine and the Garde Meuble, the Place Louis XV., now known as the Place de la Concorde, and the monumental bridge which is flanked by pedestals that await their statues, when that immense creation was drawn as it were out of chaos, it can be said that more was done for the development of taste and the love of the beautiful amongst the people than by all the freezing social dogmas that have been promulgated since that time.

It is by the perpetual contact between art and the public, the constant meetings between creations of genius and minds that are open to whatever touches them or excites them, that France during two centuries gained repute for its good taste. Every workman was then more than a workman; he was also an artist. There was not merely a Boule, but the poor village joiner, humble, obscure, and unknown, who for the marriage of his daughter, or other *fête* of that kind, would make a press with sculptured panels and ornamental mouldings. He was not a sculptor, but he possessed a feeling for art, and then he had time, for politics was invented subsequently. The work that was thought so modest at that time now holds a high rank. The modern workman has no longer the time to attempt a work of its class, and then where is he to find inspiration or examples to copy?

CHURCH RESTORATION.

THE following is the second letter of Lord Grimthorpe on the subject of restoration:—

The cant of "antiquaries," whether true or false, will sink church restoration into a lower stage of degradation than it reached under Wyatt and the Georgian churchwardens and deans if it is not stopped by the application of some common sense. And, therefore, I will use the Precentor of Lincoln and his answers and no answers to my questions as a peg to hang some general remarks upon, though he has put himself out of court by refusing to answer whether he has ever seen the work to which he applied some silly and vulgar epithets. He manifestly would have said he had, if he could say so. Does he not think it would have been more honest, as he writes to me about "honest architecture," to confess openly that he has not?

The leading idea of him and his associates, except when they quarrel among themselves about facts, as he and Mr. W. White, F.S.A., and a lot of other F.S.A.'s did about the history of the roof here, is that the latest things that they are pleased to call antique and "honest" ought to be copied when they must be rebuilt somehow; and that if you dare to try to imitate the original style of the building instead you are a Brummagem impostor and destroyer, and your building dishonest, false, and so on; but if you imitate the later antiquity, however accidental, defective, inconvenient, or ugly it may have been, you are committing no fraud, making no pretence, and are altogether a virtuous and exemplary restorer.

If such people were capable of reasoning they would see that even their own folly turns against them. For there is far more pretence and risk—or hope—of deception in rebuilding a copy of what the present generation has been accustomed to see than in building something else which every one can see is a novelty. I have been very successful in such deception wherever I have intended it. Indeed, that was the very argument used by the chief objectors here to my not rebuilding a copy of that west window which Fergusson, when he saw it, called "a very bad specimen of a very bad style." As soon as the new one was up those very persons candidly recanted, and Fergusson wrote not long before his death that "nobody with less confidence in his own judgment than Sir E. Beckett would have done so in the face of all that opposition, but that probably no one now wished it had been done otherwise." I only quote from memory, but that, I know, was the substance of it. Our telescopic precentor does think otherwise from his watch-tower at Lincoln, and perhaps he thinks that by perpetually writing his opinions about restorations all over England he has acquired a hundredth part of Fergusson's knowledge of architecture, who always protested, as I have, against the assumption of antiquaries to be *ex-officio* authorities on building.

As these people are so fond of talking of building, up to some undefined epoch, being always "honest," which they do not even pretend to mean either constructionally or architecturally good (but, for all that, it is our duty to copy it), I will give a specimen of that doctrine from the hand of our Precentor himself, with whom, no doubt, any number of self-styled antiquaries are agreeing just now in denouncing my "destruction of the large Perpendicular window in the south transept," which was obliged to come down with the rotten walls enclosing it. Of course, he means everybody to understand that it was a genuine, "honest" work of that Perpendicular old Abbot Wheathampstead, who lively jovially to 100, and introduced fellow-commoners and noblemen among the monks, and the monastery and the adjacent nunnery soon after became the sink of iniquity which even the Pope's commissioners denounced

in language for which I must refer to Mr. Froude's "Short Studies." For it is hardly conceivable that a Precentor of a great cathedral would write as he does if he knew all the time that that window was only a Brummagem relic of some William IV. restorers, and so a mere fraudulent pretender to Perpendicularity, and built in succession to a wooden one of some previous more economical ædiles. He may take his choice between knowing and not knowing; for in either case he has given us a very useful measure of the competence of "true antiquaries" to tell us how to restore churches. I did not expect such a piece of luck. It is much too good to be angry over, as he thinks I am.

And then comes another. For reasons of his own, which I well know, up starts a "judicious bottle-holder" to the canon, and a genuine F.S.A., Mr. W. White, architect—not Mr. W. H. White, the secretary of the R.I.B.A., with whose late remarks on the no-education of architects in England I cordially agree. Of course, he contradicts me about the old-roof question, but the *concordia discors* between him and the Precentor and a heap of other equally true antiquaries about the history of that roof is delightful. He need not think that I am going to argue either that or the other old questions over again. Whichever of them was right, we know perfectly that Mr. White's theory was, and is, as wrong as possible, from facts which stared us in the face, though not him. He distinguished himself, too, in a conflict (not with me) about that "interesting Norman corbel table," which the clerk of the works replied was singularly composed of modern bricks plastered. I have several times had to criticise his own restoration exploits, as a matter of construction, which would illustrate his namesake's conclusions about the practical and mathematical education of the R.I.B.A. fraternity, who are so fond of proclaiming themselves *homines trium literarum* besides.

I am not going to reargue the question of the south turrets with Mr. Venables. He thinks it a clever and safe thing to say—and the true antiquaries generally do, as it commits them to nothing, and intimates that we are not to be believed—that there are always two opinions about the stability of anything that has not actually fallen down. Yes, there are. One from those who have practically to deal with it, and must ascertain its real condition before they go on to do what is necessary, at whatever cost; and the other from vapouring outsiders, with no responsibility and no knowledge, and no care what may happen if the structure will stand a little longer for their amusement as an interesting semi-ruin. I remember the ruination society strongly dissuaded the vicar of St. John's, Chester, from restoring that fine tower; and if he did anything, he was to take care that it did not look like restoration. He was foolish enough to listen to them, and within a year the tower fell, as many people knew it would if not restored. We know to our cost here how much architects' estimates of the cost of repairs are to be trusted even when they have been paid for examining, some of those that we had having gradually risen in various proportions up to 22 before we could get the work undertaken. I was not very likely after that to attend to volunteered assurances that the turrets "would stand another hundred years," even if the assurers had had any independent claim to credibility. The Precentor naturally knows still less of the reasons why it was absolutely necessary to remove the good-for-nothing brick roof of the slype than he easily might of the history of the window over it, and I am not going to tell him. When the slype is restored and the south front finished he can come and see them, and find some more "Brummagem finery" to talk about, and make some mistakes in discriminating between old and new.

He evidently does not see what he is doing in being so ready to answer the leading question I put to him about the Lincoln restorations, which I thought generally very good when I saw them with Dean Blakesley in my visits to help the chapter about their great clock, made by Potts, of Leeds. He says exultingly that they are not done so as to make the work look shabby and patchy, as both I and others had told him that Scott's does here, and now must for a long time to come—*i.e.*, until all the semi-decayed stones that he persisted in leaving have got so bad that they must be replaced with new ones of the same kind and colour as his. The fact was that Scott was frightened out of his senses latterly by those pests of architecture into doing all sorts of stupid things which he did not in his best days. He actually wrote almost violent letters against my putting windows into the modern walls of the four dark bays of these aisles, which had consequently acquired the name of the "iniquity corners," all because there were none before. Can church restoration sink to lower degradation than that and the wish of all "true antiquaries" that I had either left alone or copied all the late rubbish at the west end, so rotten that it was dangerous to take down? Its appearance is, happily, preserved in photographs, and I have not patience to describe its nature again. Anyone who wants to know it may find it and a copy of the old photograph for a shilling in my little book on the cathedral. Perhaps by this time the Precentor wishes he had taken that trouble, instead of taking shots at a venture, and confessing that he and his chapter try to get their restorations done as fraudulent copies of the old work instead of "honestly indicating their own date" as much as possible, like the abominable slate-pencil looking shafts with which Scott defaced the western part of Salisbury, and many other churches too; not that I suppose he intended them so to indicate their date, but did it in ignorance both of stone and work; and so do most architects and builders if they are allowed. But, according to the antiquaries and anti-restorationists, that is the right way to restore churches when you must restore them for safety.

But it is time to stop. I said that Canon Venables had perhaps done some good by his former letter about real ruins. I think he will now have done more about real churches, with my assistance, and will have taught people of common sense to treat these meddling pretenders to knowledge of building as they deserve. Architecture does still mean building well, with a view to use, beauty, and stability, and the meanest and most degrading theory of it that ever was invented is that which I have been exposing now and whenever I have had the opportunity, by being either attacked or invited. Not that I am going to "blow trumpets" before any walls that I have not seen, even on invitation and second-hand information. I leave that to the Precentor.

LEEDS FINE ART GALLERY COMPETITION.

WE are asked to publish the following letter, which has been forwarded to the town clerk, Leeds:—

65 Albion Street, Leeds: September 16, 1886.

Dear Sir,—I am requested by the Council of the Leeds and Yorkshire Incorporated Architectural Society, and architects in Leeds who have entered upon the above competition, to draw your attention to the announcement which appeared in this morning's papers, to the effect that the competition which was limited by you to architects in Leeds has been extended to the profession generally, and to say that they cannot allow this extraordinary breach of faith to pass without protesting. They desire to point out that to change the conditions at the present advanced stage of the competition is to take an undue advantage of the competitors who have already laid out time and money, and would not have done so had the competition been advertised at first as an open one.—Believe me, dear sir, yours faithfully, G. B. BULMER, Hon. Sec.

The Town Clerk, Leeds.

The letter is further signed by twenty-three firms of architects.

THE RESTORATION OF WESTMINSTER HALL.

ON Monday, in the House of Commons, the First Commissioner of Works was asked whether the work of restoration now commenced at Westminster Hall included the building of two staircases having projections of about 23 feet and 15 feet respectively into Westminster Hall, and whether he would consent to reconsider this portion of Mr. Pearson's plan.

Mr. Plunket, in reply, said:—The scheme which has been sanctioned by the House includes the erection of two open flights of steps having projections not of 23 feet and 15 feet respectively, as stated in the question of my hon. friend, but of 20 feet 6 inches, and 9 feet 6 inches respectively. Flights of steps fulfilling the same object as those now proposed and occupying very similar positions have existed in Westminster Hall very nearly throughout its whole history. Thus one of the new flights of steps will be in the north-west corner of the hall close to Palace Yard, and will occupy closely the position of a similar flight which existed there since the middle of the thirteenth century—Henry III.'s time—and gave access to the first floor of the Exchequer Buildings. The second flight of steps, to which attention is called, and which has the projection of 9 feet 6 inches, will take the place of two others, which old plans, published in Mr. Pearson's report upon the scheme, show to have existed in the seventeenth century, and which there is very good reason to suppose were erected by Richard II. when the hall was remodelled by him. These two old staircases give access to the upper floor of the buildings which existed from before 1400 to 1822 between the great buttresses, which buildings are now about to be erected. As to the artistic effect, Westminster Hall undoubtedly presents an empty and bare aspect since it has become merely a passage-way to the Houses of Parliament, and I am advised that it requires some small well-treated features to give it scale and to suggest its size and impressiveness, and that these staircases—more especially as they replace old ones—will do just what is required in this respect. In fact Mr. Pearson informs me that he readily availed himself of the opportunity of reinserting them because of the distinctly advantageous effect he is con-

vinced they will have upon the interior of the hall. I cannot but think that his opinion deserves to have great weight attached to it upon such a point.

TESSERÆ.

Cultivation of Eye-power.

SIR G. G. SCOTT, R.A.

IT is ridiculous to suppose that such an art as architecture is to be learned without the most careful study of its existing productions, or that originality is likely to be developed upon a basis of ignorance; and it is equally unlikely that excellence will be attained solely through the medium of knowledge, without the most jealous and careful training of the eye to the most delicate and scrupulous perception of the right and the wrong in form and proportion. The want of this is the most crying sin in modern architecture; especially, I fear, in this country. Continually is the more cultivated eye offended by discords which in music would set the very teeth on edge. I know not how to advise you on this point. This delicacy of perception is in some degree intuitive; but that it is not wholly so is proved by the fact that the works of some periods are nearly all harmonious, while at other periods this harmony seems only occasionally to have been attained. The only rule I can suggest is the jealous cultivation of the eye. As the greatest of moralists has said, "Keep thy heart with all diligence, for out of it are the issues of life"; so one may say to the architect, "Keep thine eye with all diligence, for out of it are the issues of art." Never allow your eye to get accustomed to or condone errors of proportion, even in works which in other respects you venerate for the noble art which clothes them, and much less allow of any deliberate error in your own designs. To avoid these blemishes sketch your designs over and over again, no matter how slightly and roughly, rejecting rigorously everything against which the eye rebels, and never permitting a proportion which it has once condemned to remain even for a minute before you—for ocular perception is most delicate, and its instinct may be blunted by dwelling even for a few seconds upon what its first impression saw to be wrong. Never clothe a form with pleasant drawing till its proportions have been thoroughly sifted and rigorously collected; and if you fear that you have, by dwelling too long or too indulgently upon what you have sketched, prejudiced your eye in its favour, put it away and attend to something else, or take the opinion of some unprejudiced person in whose correctness of eye you have confidence, for the first impressions of another will often correct your own.

Church Restoration.

W. BURGES.

There is really no more difficult problem in the whole practice of architecture than that of restoration; for a man to succeed thoroughly in it must be not only versed in modern and ancient construction, but must also be an antiquary and something of an artist. Yet how often do we hear of young men just out of their apprenticeship, and with good connections, beginning life with the one or two churches to build, and five or six more to restore. Of course the new churches do not matter very much; for, as I said before, church building is the sole thing taught in an office; but it is a very different thing as regards the restored churches, in each of which we run a chance of losing some landmark in the history of architecture. So often, indeed, has this happened that, as a general rule, when one hears of a church having been restored, it is hardly worth going to study from. What really is wanted in the restoration of a church is to do as little as possible. Keep it together if it is possible. If an aisle or tower is tumbling down, rebuild it, using as much of the old materials as possible, and inserting a small inscription to record the fact. Should there be any money to spare, employ it in a work of art as good as you can get for your money, *i.e.* one stained glass window, a dossel, or a painting on a wall or roof; but then get it good, and let it tell some story; in fact, let it be such that an artist would think it worth his while to turn out of his way to look at it.

Architecture and Sculpture.

C. H. SMITH.

It is quite possible to introduce sculpture into an architectural design without reference to its proper adaptation, and it may be out of place, or out of proportion to the size of the building, when it will be a disfigurement rather than an embellishment; but if it be judiciously introduced, so as to form an integral part of the entire composition, and to convey to an intelligent beholder the idea that, if it were removed, the building would be incomplete, I think you will all agree that it gives to a fabric refinement and a finish of no common kind: in the one case it may appear like the ostentatious display of a wealthy nobody; in the other case it can scarcely fail to convey to the discriminating mind of a well-informed observer the impression that the entire edifice, including its sculptural decorations, is the design of a highly educated artist. In mediæval art it is almost impossible to separate the department of sculpture from that of architecture, of which it has always formed the most ornamental feature, more particularly in the style which prevailed during the fourteenth and fifteenth centuries. Few persons, except those who have paid attention to the subject, can imagine while they contemplate a venerable Gothic structure, how much beauty and refinement it has lost by the destruction of its statues and ornamental carvings. The pedestals and acroteria of a Greek or Roman façade may be left without statues; even the pediment may remain unadorned with sculpture, and the great number of observers would not be struck with its plain or unfinished appearance. But a rich screen, or the lady chapel of a cathedral, with a number of vacant niches and canopies, is somewhat analogous to a splendid apartment, on the walls of which are suspended handsomely carved frames for full-length portraits, without the pictures.

The Temple of Delphi.

E. DODWELL.

Delphi was plundered eleven times before the reign of Nero, and that emperor took five hundred bronze statues from the temple. Yet, after all these deductions from its ancient splendour, Pausanias left a particular description of one hundred and thirty-seven statues, besides a general mention of a great many others of warriors, wrestlers, and musicians, which probably amounted to as many more. These precious ornaments were included within the boundary, or sacred enclosure. Yet, even in the time of Strabo, its treasure had disappeared; in the time of Pausanias it was destitute of money, and the rich offerings of Gyges, Alyattes, Crœsus, and Midas, with the accumulated liberality of kings and of nations, could be seen no more. "Even the Phrygians, Lydians, Persians, Assyrians, Phœnicians, the Italians, and the Hyperboreans themselves," says Pausanias, "sent offerings to Delphi." The temple and the god, the rites of sacrifice, and the predominance of superstition enriched the barren rocks of Parnassos with a greater variety of sumptuous products than were to be found in the most fertile fields and cultivated plains. According to Justin, the army of Brennus revelled in its luxuries. Strabo calls the temple of Apollo "the common temple," and Livy "commune humani generis oraculum," as it had become the resort of all nations. Strabo and Pausanias denominate it generally, by way of eminence, "the temple." Even the form of the temple is not known. Cyriac of Ancona says it was circular, as it has been designed by the most celebrated painters, particularly Claude Lorraine and Gaspar Poussin. On a scarce copper coin which I procured at Delphi it is represented of the most common form—a rectangular oblong, with six columns on the sides and two in front, with a statue between them; but as it was frequently destroyed and rebuilt, its original plan was perhaps not uniformly preserved. It is not less surprising than true that one of the most celebrated edifices of the world has been so entirely destroyed and so thoroughly obliterated that sufficient traces are scarcely left by which the traveller can form even a conjecture as to its position. It must, however, have been magnificent, as the rebuilding of it by Spintharos, about 512 B.C., is said to have cost about three hundred talents. The *Apollo Belvedere* is supposed to have been a copy from the statue which was in the temple of Delphi. Canova thought the original was of bronze, alleging, in justification of this opinion, that statues of that material have a certain style different from those in marble, and that the *Apollo Belvedere*, particularly the drapery, appears to have been copied from bronze.

Greek Mosaicists in Italy.

SIR M. D. WYATT.

Although the Greek artists do not appear to have executed any great works, either in fresco or tempera, in Italy previous to the year 1150, still we have certain earlier indications of their, at least, temporary presence. We know that they were employed, because they were sent for to execute work in different places. Perhaps the most interesting instance on record is that of the monks of Santa Maria Novella of Florence sending to Greece for artists to decorate the substructures of their church. An additional value is given to this relic by the circumstance that Fra Giacomo da Turrita, the Monk of Sienna, who first acquired the art of mosaic for Italy, amused himself in his youth by watching the Greek artists at their work, and thus learnt to imitate the processes employed by them. He first executed a small mosaic for the cathedral of Florence, after which he is lost sight of for some years, until he reappears in Rome, where he produced, in the churches of San Giovanni Laterano and Sta. Maria Maggiore, several very beautiful mosaics: one representing the Coronation of the Virgin, and the other a species of allegorical composition, combining the mysticism of Dante with the old literal spirit of Greek tradition. Next to the works of Fra Giacomo we may particularly dwell on those of Andrea Tafi. At the time when

he began to work in Florence the Republic was building the baptistery, and wished to decorate the interior with mosaics. The authorities called Andrea to their counsel, and, evidently thinking him a very clever workman, sent him to Venice to ask the Venetians, who were then constructing the church of St. Mark, to lend them some Greek workmen. Accordingly, a certain Maestro Apollonio came to Florence, and taught Andrea Tafi to execute the desired mosaics. From that time the art of working in mosaic was naturalised among the Italians, and flourished to a high degree at Pisa and other places, and particularly at Florence, where the whole of the baptistery is covered with mosaic from the floor to the summit of the vault: and many, no doubt, remember the peculiar octagonal form of the vault and the brilliancy of the mosaics. As the prevailing tone in these last was golden, it became necessary that the colours should be of a brilliant character, in order to balance so large a mass of gold; and we find accordingly that even the pavement is entirely worked out in mosaic, to insure the harmony and keeping of the whole.

Insufficient Timbering in Houses.

J. LEMON.

Modern builders have found out that the element of strength in a beam is the depth, and they have carried this principle to such an extent that we now see boards on edge made to answer as joists. I do not so much object to the deficiency in thickness in joists if they are well strutted as to the want of sufficient depth in proportion to the span. Many persons are so ignorant of the strength of timbers that they have a stereotyped scantling for joists, which they use for all spans in small houses. The result of such a system may be easily imagined; in some cases they have more than sufficient and in others the deflection is considerable. Of all portions of timbering there are none so often scamped as the lintels, and when we consider the small proportion they bear to the total quantity of timber in a building, it is surprising that men will injure the stability of a structure by crimping their scantling. Gutter-plates in V roofs also afford a grand opportunity to the cheap constructor to save timber; it is unnecessary to state that he does not hesitate to avail himself of it, consequently in a short time there is a permanent set; this is one of the causes of leaky roofs. Light rafters of long span are amongst the things to be avoided in construction. A really good strong roof may be easily constructed by the introduction of a light truss, or by trussing two of the rafters, and placing the purlin upon the crutch formed at the junction of the strut with the rafter. By this means in small houses the span of the rafter is reduced to a minimum, and one of small scantling may be used with beneficial results. The construction of roofs by judicious trussing is a matter in which scientific knowledge will give the architect an immense advantage, enabling him to design a stronger structure with the same quantity of, and in many cases less, material. In the present mode of designing shop-fronts the bressummers are mostly formed of a baulk of timber, resting upon storey-posts of small scantling, and in many cases without any ties to the joints, to prevent the entire front from pitching into the street.

Origin of Architectural Style.

S. SMIRKE, R.A.

The experience of all ages shows that the fluctuations of style are the result of causes over which man can exercise but slight control. The varieties of soil, of climate, of available materials, are among the obvious causes of diversity in architectural style: the discovery of a new material, or of a new region: the requirements of religious, political, or commercial movement, these have been the chief agents that have given birth to those modifications of style which mark the history of our art. It may not be unprofitable to occupy a few moments in noting some instances of the operation of these external influences. The style now known as Byzantine owes its origin not to the inventive labour of any individual artist of Byzantium, but to the struggles for imperial power in Rome, which led Constantine to establish the seat of his Government on the Bosphorus, and so brought Eastern and Western art into such combination—each imbuing the other with many of its peculiarities—that this *tertium quid*, the Byzantine style, came into existence. Again, the style known as that of the Renaissance is traceable, not to the mere ingenuity of the artists at that period, but to the extraordinary growth of the power of the Turks, who, sweeping before them the degenerate remnants of Roman power, pillaged Constantinople, and scattered its comparatively polished inhabitants over Europe, there to sow the seeds of a taste for classic literature and art. The style of architectural decoration called Raphaelesque, after the great artist who first practised it, really owes its origin not to the inventive powers of that master, but to the eager excavations in search of classical antiquities which led to the accidental discovery of the Bath of Titus, the beautiful decorations of which building suggested to Raphael their resuscitation. Then, if we turn to another class of architectural design, we shall find that castellated structures, with their lofty towers and frowning machicolations, totally altered their style and aspect at about the fifteenth or sixteenth century—not from the caprices or ingenuity of artists, but because some unknown person had chanced to discover the chemical effects of combining, in certain proportions, nitre, sulphur, and carbon, thus totally altering the mode of warfare. If we descend to times nearer our own, we shall find like examples of the influence of accidental causes over the fate and fortunes of high art. Napoleon, for a while, found it his policy to take imperial Rome as his model, and to obliterate, as far as possible, the reminiscences of the ancient *régime*. Hence Percier and Fontaine, following out not an æsthetic law but a political necessity, inundated France, and, by consequence, Europe, with representations of curule chairs and the lictors' fasces, and at once the florid school of Louis XVI. was superseded by the severer forms of classical antiquity. I might draw further illustration from the ardent revival of Mediæval art in our own days. An enthusiasm which all the labours of a Carter, a Britton, and the elder Pugin failed to kindle, blazed forth, not at the call-note of archæology, but of a class of religionists who sought to feed the eye and the imagination with the materials of a more objective worship.

Contact of Metals.

G. R. BURNELL.

When two metals are used in contact in positions where moisture in any form has access to them, a species of galvanic action is established, which causes them to decay with great rapidity. Illustrations of this may be observed in iron railings, when the bars are secured to the stone curb with lead, and the decay is most evident when the iron is of the best and most malleable description. A similar phenomenon may also be observed when copper or bronze is in contact with iron in sea-water; though the iron decays rapidly, it appears to exercise a protective influence upon the copper.

Strength of Timber Beams.

C. G. SMITH.

Galileo was among the first to investigate the strength o wooden beams on purely mathematical principles; and, like many later investigators, after employing the higher mathematics to an unlimited extent, arrived at conclusions incompatible with practice. To use Tredgold's words:—"Fortunately that precision so essential to the philosopher is not absolutely necessary to the architect and engineer," consequently simple formulæ, such as $W = C \frac{b d^2}{L}$ may be resorted to in practice. These formulæ are generally deduced from actual experiment in the manner somewhat as follows:—If a beam of b inches in breadth, d inches in depth, and L feet clear span breaks with a weight W in cwts. applied at the centre, it is not difficult to determine in what ratio the strength of another beam of the same material will vary. If the breadth be double, it is at once evident that its strength is doubled; if its length be double its strength is practically halved, and, if its depth be double, its strength will be increased four times. For these reasons the sectional areas in tension and compression, as well as the distance apart of their centres of gravity are doubled, consequently the moment of resistance of the beam is increased four times, and similarly by using any other depth it will be found that this moment varies as the square of the depth. The breaking weight, therefore, varies directly as the breadth and square of the depth, and inversely as the length, therefore $W \propto \frac{b d^2}{L}$. Now, it is well known that the adhesion of the particles or fibres to one another affect the strength of a beam to an extent that can only be determined by introducing an unknown quantity. W therefore becomes equal to $C \frac{b d^2}{L}$, where C is the unknown but nearly constant quantity, the value of which can only be obtained by actual experiment. But since the strengths of no two beams of the same timber and scantling are precisely the same, it follows that no two constants will be equal in value. This accounts, to some extent, for the variety of scantlings employed for one and the same purpose. A short time since a warehouse floor gave way, and the engineers employed on opposite sides of the law action which ensued had little difficulty, by using the extremes of constants, in making their calculation suit the wishes of their respective clients. The floor was thus shown on good authority to be at the same time both amply strong and too weak. Under these circumstances the only course to pursue was to call in an independent witness, who, not being content to accept a constant which might at any time be disputed, had a beam from the floor in question tested, deducted a constant from the result, and gave his evidence accordingly. As the quality of timber varies very considerably even in the same cargo, before employing it in work of any magnitude one or more average samples should be tested, and a constant deducted on which all calculations for the strength of the timber may be based.

NOTES AND COMMENTS.

A FEW days brought unexpected luck to the French Exhibition fund, and, instead of eighteen millions of francs, the guarantees amounted to 18,373,000 frs. But it is now proposed to keep the fund open, and the more people who offer to subscribe, the less will be the individual liability. The French Government are eager to find a great number of supporters for the exhibition. It is therefore proposed to form a committee in each department who will organise local arrangements in connection with the exhibition. This is a concession. It is also proposed to raise subscriptions for paying the travelling expenses to Paris of workmen and others. As the project has advanced so far, it is likely to be realised in a successful style.

MR. WALTER SMITH, who died last week in Bradford, was one of the best known of the provincial art masters. Thirty years ago he was appointed to the Leeds School of Art, and he displayed much energy in its management. He soon established classes in Bradford. When a master was sought to organise the teaching of art in America Mr. SMITH was selected, and remained for several years attached to the educational administration. After he returned to England he was appointed to direct the Art Department of the Bradford Technical College—an office which he held until the time of his death. Mr. SMITH was a good lecturer and writer. He was one of the men who were most opposed to the stippling process which was in vogue in the Government schools, and as far as lay in his power he adopted the French system.

WHEN the sanction of HER MAJESTY was asked for the proposed Church House, it was given on the understanding that the building was not to be considered as the national memorial of next year's jubilee. It was of course believed that a different sort of memorial was to take precedence. The letter of the PRINCE OF WALES to the Lord Mayor, which appeared this week, suggests what was contemplated. As a Colonial and Indian Institute is now proposed, there is little use in questioning its suitability. But if the proposal is intended to be a means of utilising the bankrupt Albert Hall, or to cover the vacant ground near it with flimsy buildings, the most loyal subject must demur. Neither of those schemes would commemorate the event in a manner that would gladden the nation. It is well known that the authorities of that region have done many strange things because they are supposed to be in the sunshine of royal favour. But we hope they will not go so far as to seize the proposed Institute. It is not intended, we imagine, to be a place for sightseers, but a rendezvous where men of business might go when there was an opportunity to use Colonial or Indian products. The site should, therefore, be in a place that might be suggestive of the purpose of the building, and the further it is from South Kensington the better. It is, perhaps, too early to talk of the character of the Institute. We may, however, be allowed to hope that it is to be representative of the best architectural skill of the country, and which is not to be found in any Government office.

THERE is a temptation before the presidents of societies when they deliver addresses to announce something startling, and Sir SPENCER WELLS was not able to resist when he spoke at York on Tuesday. The Sanitary Institute may be a useful society, but it is not a great one, and, as yet, it has not done much to justify its title. It has hardly gained more than a footing in the country, and there is a suspicion it is simply an organisation to exalt a small clique. If the address could be taken seriously, Sir SPENCER WELLS was rather premature in proposing to transform the Institute into a College of Health, in which all the various sanitary societies might be consolidated. It appears the Sanitary Institute and the Parkes Museum have amalgamated their modest resources, and, says the President, "the National Health Society, the Ladies' Sanitary Association, the Cremation Society, the Smoke Abatement Institution, and others of a like kind must follow; while such societies as that of the Medical Men Qualified in Sanitary Science and the Society of Medical Officers of Health would find themselves more fitly placed and more usefully employed as sections of one united body than they now are." We are sure many of our readers have never heard of those societies, because they are not so successful in trumpet-blowing as the Sanitary Institute. It is possible some of them may be in a better position than the Institute, and may resent the proposal for amalgamation. But everything turns on money in the Institute. If we had only adequate funds, said the President, we could form commissions, send out expeditions, set up laboratories, museums, deliberative councils, exponents and consultants. Was there ever a more attractive prospect held out to persuade subscribers to join a society? The authorities of the College of Health, which is protected by the British Lion, in the Euston Road, may object to the arrangement, as they have a copyright title.

THE terrace of the palace of Saint-Germain has been selected as a site for the cast of TRAJAN'S Column, which was long lying in sections in the cellars of the Louvre. It will be seen to more advantage in that position than the copy in the South Kensington Museum. In the château two chambers have been arranged in the styles of HENRY IV. and LOUIS XIV. The former King had little regard for that building, and erected another château, but LOUIS XIV., before he was attracted by Versailles, was an admirer of Saint-Germain, and is supposed to have expended about 300,000*l.* on the place. The King afterwards placed the château at the disposal of JAMES II. At a later time it was used as a prison.

THE church of Walton-le-Dale, near Preston, is in a perilous position. It stands on a steep bank by the River Ribble. The bank is in danger of slipping, and should that event occur the church is sure to collapse. There are three courses before the parishioners. First, to lay out 800*l.* on a big retaining wall; secondly, to expend at least 600*l.* in reparations, for at present the building is not fitted to accommodate a congregation; and thirdly, to abandon the building and erect a new building in a safer place at a cost of 6,000*l.* There are associations about the present site, for a church was founded on it seven centuries ago. The owners of the estate are in favour of the first and second courses, but the parishioners are desirous of a removal.

AN inquiry has been made by Mr. T. HARNETT HARRISON into the constituents of the boards who administer the Public Health Act, and the results were furnished to the congress at York. Information was given in 202 cases. Although there are twenty-two classes among the 2,796 members representing those cases, Mr. HARRISON says the administration is virtually in the hands of four or five classes. It is needless to say the builders are supposed to be worst of all, for that is a fundamental principle with one class of sanitarians. The builder members of sanitary boards, says Mr. HARRISON, "generally get elected in order that they may build cheaply and in defiance of the law. The result is that the public health is often sacrificed in order that a paltry sum of money may be retained in the pockets of the men appointed to promote public health. A body of men who are elected by their fellow-men to save life turn round and kill their electors for a small fee. And one is inclined to say it serves the electors right, since the public are entirely responsible for the presence of builders on Boards of Health and for the kind of dwellings they erect." He quotes a brother medical officer of health, who writes in this strain:—"I deeply deplore that builders should obtain seats on health boards. I deeply deplore the terrific rate of infant mortality in my district, and would help in any way possible to reduce it. Of course builders of cottage property are well represented." But the amazing thing is that although on English boards everything goes by numbers, the builders are not numerically strong. Among the 2,796 members in Mr. HARRISON'S tables, only 212, or 7½ per cent., are builders. He explains their power by saying, "Verily a little leaven leaveneth the whole lump." It is foolish to talk in this way, because the builders have no society to back them; but if they had an institute, what strange stories could be told about doctors and medical officers of health!

SUMMER.

IT must always be a subject for wonder that, at a time when the French Revolution was brewing, artists like WATTEAU, LANCRET, BOUCHER, and others painted idyllic scenes. They had no suspicion of what time was about to bring forth. LANCRET followed WATTEAU, and there were critics who gave pre-eminence to the works of the later master. The illustration we give this week is one of his most characteristic works, although this is, we believe, the first time an illustration of it has appeared in England.

THE CRESCENT CHURCH, BELFAST.

THIS new church, which is now being erected for the Linenhall Street Presbyterian congregation, occupies a fine site on University Road, between Upper and Lower Crescents. The accommodation provided is somewhat extensive, comprising, besides the church, which will seat over 1,100 persons, a hall to seat 600, arranged for division into classrooms; a lesser hall for 250 persons, session-house, vestry, ladies'-room, kitchen, &c., and ample cloak-room and lavatory accommodation. The masonry is already well advanced, and the church is expected to be ready for opening early next year. The contractors are Messrs. FITZPATRICK BROS., Belfast. The architect is Mr. JOHN B. WILSON, A.R.I.B.A., of Glasgow, whose design was selected in competition, our illustration being reproduced from the architect's drawing.

VICARAGE, MICKLEFIELD, YORKS.

THIS house is being built by the patron of the living, Mr. J. D. BLAND, of Kippax Hall, in order to supply the present want of any proper residence for the incumbent. The materials are brick with tiled roofs, and an attempt has been made to add ornament to what will be, in all essentials, a commodious residence. The architects are Messrs. CHORLEY & CONNON, of 15 Park Square, Leeds.

MEMORIAL CHAPEL, LLANDOVERY.

RESIDENCE, BOURNEMOUTH.

PROPOSED IMPERIAL INSTITUTE.

THE following correspondence has passed between the Prince of Wales and the Lord Mayor :—

Marlborough House, Pall Mall, S.W. : Sept. 13, 1886.

Dear Lord Mayor,—My attention has been frequently called to the general anxiety that is felt to commemorate in some special manner the approaching jubilee of Her Majesty's reign.

It appears to me that no more suitable memorial could be suggested than an institute which should represent the arts, manufactures, and commerce of the Queen's Colonial and Indian Empire.

Such an institution would, it seems to me, be singularly appropriate to the occasion, for it would illustrate the progress already made during Her Majesty's reign in the Colonial and Indian Dominions, while it would record year by year the development of the Empire in the arts of civilisation.

It would thus be deeply interesting to Her Majesty's subjects both within and beyond these islands, and would tend to stimulate emigration to those British territories where it is required, to expand the trade between the different British communities, and to draw closer the bonds which unite the Empire.

It would be at once a museum, an exhibition, and the proper locality for the discussion of Colonial and Indian subjects.

That public attention has already been forcibly directed to those questions is sufficiently proved by the remarkable success which is attending the Colonial and Indian Exhibition at South Kensington, and I confidently anticipate that arrangements may be made whereby the more important collections, which have so largely contributed to this success, will be placed at the disposal of the Institution.

I have much satisfaction in addressing this letter to your lordship as chief magistrate of the capital of the empire, and to invite your co-operation in the formation of this Imperial Institute of the Colonies and India, as the memorial of Her Majesty's jubilee by her subjects.

Should your lordship concur in this proposal, and be willing to open a fund at the Mansion House, I would suggest that the contributions received be vested in a body of trustees, whom the Sovereign would be asked to nominate, and I would further suggest that the institution should be under the permanent presidency of the Heir Apparent to the Throne.—I remain, dear Lord Mayor, yours truly, ALBERT EDWARD P.

The Right Hon. the Lord Mayor.

The Mansion House, London, E.C.: Sept. 17, 1886.

Sir,—I have the honour to acknowledge the receipt of your Royal Highness's letter of the 13th inst., and, in reply, to express the great pleasure it will afford me to give the heartiest co-operation and aid in the formation of the proposed Imperial Institute of the Colonies and India as the memorial of Her Majesty's jubilee by her subjects.

Your Royal Highness truly states that general anxiety is felt to commemorate in some special manner the approaching jubilee of Her Majesty's reign. There will, I am sure, be a universal desire to give expression, in a suitable and, if possible, adequate way, to the deep attachment, veneration, and loyalty which the Queen's subjects in all parts of her vast dominions entertain for a Sovereign whose long and illustrious reign has been productive, under Providence, of many blessings to her people, and been rendered memorable by the striking progress in civilisation and prosperity developed throughout the empire.

Difficult as it may be to signalise in a commensurate way the feelings which are thus naturally emphasised at the approach of the jubilee of Her Majesty's reign, I am convinced that the proposal which your Royal Highness indicates, and which has the support of your influence, will be considered singularly appropriate.

It will, therefore, give me much satisfaction to open a fund at the Mansion House for the receipt of contributions, as suggested by your Royal Highness.

I have the honour to remain, sir, with the greatest respect, your Royal Highness's most dutiful and most obedient servant,

JOHN STAPLES, Lord Mayor

To Royal Highness the Prince of Wales, K.G.

ST. MARK'S, VENICE.

THE following memorial has been sent to the Prefect of Venice by the Society for the Protection of Ancient Buildings :—

Your Excellency,—In reply to a memorial from Italian and foreign artists with regard to the so-called restoration of the interior of St. Mark's, at Venice, dated September 12, 1882, you were good enough to give the following assurance to the memorialists :—

"You must understand that the Minister for Public Education will never approve of repairs which involve alterations such as you deplore in ancient works of art, as, for example, in the last arcade to the right looking towards the basilica of St. Mark; and will no longer sanction the action of those persons who, to make work, destroyed like Vandals that which might have been preserved for future ages; neither will he approve of that fictitious restoration of which you justly complain."

The Society for the Protection of Ancient Buildings, in common with the other memorialists, accepted this assurance, as giving hope of a more reasonable treatment of the building committed to your charge, but they have recently learned with extreme regret that it is proposed to take up and relay a portion of the mosaic pavement of the nave for the purpose of correcting the undulations in the pavement caused by the subsidence of the foundations.

The Society has received reports from two correspondents resident in Venice, who have carefully examined the pavement, to the effect that as far as can be ascertained no recent settlements have occurred in the foundations of the cathedral affecting the pavement, which is practically in the same condition as it has been for centuries, and they are at a loss to understand the reason for the proposed alteration.

The Society would respectfully submit that the suggested relaying of the pavement of the nave is an entirely unnecessary work, and one, moreover, which, if carried out, will have the effect of obliterating an extraordinary and valuable peculiarity of the building.

The undulations in the flooring have existed beyond the memory of man, and have become, as it were, a part of the fabric; and some enthusiastic admirers of St. Mark's have gone to the length of believing that the undulations were purposely introduced at the time the cathedral was first built to mark the connection of the building with the Queen of the Adriatic.

The Society would particularly point to the lamentable effect produced by the relaying of the pavement of the north aisle, which work is now admitted by every one with any pretension to taste to have been a serious and regrettable mistake.

There can be no objection to repairing the pavement where defective, but this repair should be carried out by carefully replacing at once any loose, deficient tesseræ, supplying, if necessary, any missing pieces by new where required. By this means alone can the character of the ancient pavement be preserved; but, on the other hand, if the pavement, or any part of it, is taken up and relaid, the integrity of the design and the whole tone and character of the ancient mosaic will be irretrievably destroyed.

SIR SAVILE LUMLEY'S GIFT TO NOTTINGHAM.

IN addition to the letters which we published last week, the following has been received by Mr. Wallis, the Director of the Nottingham Museum :—

Rome : September 19, 1886.

Sir,—I have received three newspapers of the 7th inst., the *Nottingham Journal*, the *Nottingham Daily Guardian*, and the *Nottingham Daily Express*, giving an account of the proceedings of the Town Council on the 6th inst., at which a vote of thanks was passed for the collection of antiquities from the Temple of Diana Nemorensis, which I have presented to the Castle Museum.

Having been absent from Rome, I take this opportunity of expressing the sincere gratification with which I have received the news of the honour done to me by the Town Council of Nottingham, and of the handsome terms in which Mr. McCraith and Alderman Goldschmidt spoke of the donation in question, as well as the manner in which those remarks were received.

I have also to express my thanks for the appreciative terms in which those organs of the Nottingham press have been good enough to notice this gift. I find myself in a position of some embarrassment from the fact that the collection, which I had hoped to be able to send to Nottingham by the end of last month, has not yet left Rome, owing to the illness of the person charged with the packing, and I fear that its expedition will not be possible before the end of the month, as the steamer for Hull only leaves Leghorn once a fortnight.

The packages are more numerous than I expected, consisting of ten bales and sixteen cases. They will be addressed to you, to the care of Messrs. Bailey & Leetham, Hull. Each package will bear my seal, and I will write to the Customs officers at Hull to inform them that the contents consist of antiquities destined for the Castle Museum, Nottingham.

I am preparing translations of extracts from the "Bulletin" published by the celebrated Archæological Institute founded at Rome by the late King of Prussia, from which you will see what interest is evinced by the learned professors of that Society in the discoveries I have made at Nemi, and the importance attached to the relics of antiquity found during my excavations.

These translations I hope to be able to forward to you in a few days.—Believe me, yours truly,

J. SAVILE LUMLEY.

G. H. Wallis, Esq., Director and Curator of the Nottingham Castle Museum.

INDUSTRIAL ART.

A MEETING was held in the Birmingham Municipal School of Art last week for the purpose of distributing prizes. Alderman Kenrick, M.P., presided.

The Chairman, in his address, claimed that they were doing most valuable practical work. Any student who learnt practical geometry—who learnt to draw either as a machinist or as a building contractor—was advanced enormously in a great many of the trades and callings carried on in the town. Again, they were teaching in every one of the branch schools, as well as in the central school, elementary modelling, a purely technical art which was of the greatest use to the carver, the designer, the art-worker of every kind, whether he cut out metals, reset jewels, or whatever else. In elementary modelling the number of students passed this year showed a very remarkable increase. They thought they were doing pretty well last year when they passed twenty, and that number was only exceeded by one school, that of Sheffield, which passed 23, while the total passed in all the schools of England was only 138. This year they had passed 65. The examinations in solid geometry, building and machine construction and drawing, yielded this year 12 "excellents," against 3 last year, and 105 passes, against 75. In the third grade examination the number of passes and "excellents" in 1885 was 279; this year it reached 346. As last year they were ahead of all the schools in the United Kingdom, South Kensington coming next with 198, and Manchester third with only 60, he supposed they were this year almost out of hail of the other schools. They had met with a little reverse in one respect, for in the national competition for medals and prizes Manchester was first with 40, and Birmingham was second with 28. But Manchester had got all these prizes, with the exception of nine, in one department of study, viz. designing, while in the case of Birmingham the prizes were pretty equally divided over every subject of study, so that he might say their condition was sounder than that of the Manchester school, and he believed they would soon overtake Manchester in designing as they had done in other subjects.

Mr. E. R. Taylor, the head master, said the courses of lectures in design, architecture, sciography, and the history of art had been increased, and both lecturers and students had worked very hard and successfully. Last year in those of the advanced examinations for which these lectures prepare they passed fifty-three, this year 132. The lectures and classes in architecture were only commenced last year, and he wished to draw the special attention of architects' pupils and those engaged in the building trades, and also of those wishing for a thorough art training, to this part of the course. The standard of the examinations which the students had this year so successfully passed is as high as, if not higher than, that for the diploma of the Institute; and, indeed, they would be glad to prepare students for that examination also. Architecture had again begun to exert its legitimate influence in the higher walks of painting and sculpture, as well as in the designs for manufactures. The divorce which has so long been fatal to the cause of art was ending: architects were becoming more artistic, and painting, sculpture, and design were becoming more in accord with those high æsthetic laws which governed all real architecture. Mr. Taylor went on to give some advice to the students as to the methods of drawing, and to contend that if it be given fair play the faculty of imagination, so important an element in art work, is much more prevalent than has often been supposed. Ignoring it, people had tried substitutes for it. About thirty years ago almost every article of manufacture was in whole or in part a copy of some natural form. Then came literal thefts of scraps of historic art, and the publication of Owen Jones's "Grammar of Ornament," of which every manufacturer in England must have bought a copy. Indeed he saw indications that we were getting back to the naturalistic craze. Some of our best manufacturers said so, and, sad to say, were catering for it. The aim of the school was to develop and direct the imagination by really teaching to draw, instead of merely to copy; by allowing, concurrently with this, the exercise of the imagination so soon as any material had been obtained by the student; by encouraging decorative treatment of all studies from nature, including the figure; by exercise in design, based on such of the historic styles as have been mastered. All design work should be an exercise of memory and imagination, whether in designing from natural forms or attempting as an exercise a variation of any form of historic ornament, or a more original exercise based on a style. If the student have only sufficient knowledge to work when the material was before him, he had not yet acquired enough to enable him to design. In some instances, such as *repoussé* work, engraving, decorative etching, terra-cotta, wood-carving, painted decoration, and others, he was sure the committee would be glad to offer facilities for such as are engaged in these trades to carry out their designs in the school. In a paper read before the British Association he endeavoured to point out some of the difficulties which in the late past stood in the way of a real growth of art in our manufactures, and which in many cases still held their ground. In furniture there had during the past thirty years been some improvement; but in pottery, for example, there was on the average little that was artistic. There was not a manufacturer in the Potteries who could be considered as a worthy successor to the great Josiah Wedgwood. He had the art instinct, was an enthusiastic student of chemistry, had much engineering skill, in which he had also the help of Boulton or Watt; and at the same time could sit on the potter's wheel and show his workman what he wanted. United with these was skill in business and administration, which enabled him to build up an establishment which reached a world-wide fame. His ability and foresight, combined with practical knowledge of the details of the manufacture, taught him that daily development, both artistic and scientific, was necessary equally to fame and financial success. At the present time the aid of art was t often sought only to stay a dying demand, and then it was of the most scrappy character—just enough to stop the gap. So long as the demand continued, few would care to pursue art for its own sake, and as a means of raising the standard, other than financial, of their productions. With many manufacturers the notion prevailed that art is an adjunct and not an essential to their productions. Even the few who had a knowledge of art had so little faith in it that their cry was, "Art does not pay; the public will only have ugliness and novelty." Throwing the blame on the purchasing public was a constant cry, but the public could not select that which was not made for them. In art supply must precede demand. Happily this question had now got beyond mere argument or speculation, and the public

would select beautiful things instead of ugly, to such an extent at least as would warrant manufacturers in catering for this improved taste, for in many cases, besides furniture, design and execution had improved vastly of late years. But to get rid of the hindrances would require the united work of both masters and men, and to this end all should encourage hand labour and decoration, accepting frankly its want of mechanical precision and power of exact repetition. There had been too much demand for mere technical skill, to the loss of simplicity and individuality of expression. Simpler patterns and methods of expression more suited to the material, instead of trying to make things appear what they were not, would often, under artistic direction, enable hand-work to compete with machinery. It was unnecessary to dispense with all machine work; but, as the first cost of a design bore so small a proportion to the cost of each article, the highest skill and taste ought to be employed. Except for the cheeseparing suicidal policy which too often prevailed, machine-produced goods might be examples of a higher quality of design and technical skill than would be possible in hand labour, although they would lack that charming variation in each which was to be found in all true hand-work. No stronger proof of art progress could perhaps be given than the interest which was awakened in some public bodies and among manufacturers and tradesmen in the architecture of their town. Some of the buildings in the centre of Birmingham, its Board schools, and others, could not but have a stimulating effect on the quality of art manufactures. But even here the curse of quantity instead of quality of decoration sometimes spoiled the proportion and repose of a good design, while at the same time there were good and artistic carvers in wood and stone to do the work well. Some towns, on the other hand, unlike Birmingham, were still dead in this respect; as, for instance, a town in which the material of the manufacture is specially suited to adorn its buildings—Burslem, the birthplace and home of Wedgwood. In conclusion, Mr. Taylor pressed upon the students to make use of the noble collection in the Art Gallery. Besides sketching there, let them use it as a memory exercise; study earnestly one example, such as the Persian ware in the north gallery, or a piece of carving in the Italian court, and afterwards try to sketch it from memory. This would be a great help in designing. Two points in this year's programme were worthy of attention. The more valuable prizes were given for decorative work, and the scholarships were no longer limited to those who in previous years obtained free admissions, but were open to the whole school.

THE YARMOUTH TOWN HALL.

AT the monthly meeting of the Yarmouth Town Council, which was held last week, the condition of the town hall was again brought up. A report was presented from the Works and Repairs Committee, which stated that two resolutions were before the Committee for discussion. One proposed that the advice of Messrs. Bottle & Olley be followed, and that the west portion of the town hall should be taken down and rebuilt. The second resolution proposed that the whole of the present building should be taken down and rebuilt on another site. The Town Council did not arrive at any conclusion.

The following is the report of Messrs. Bottle & Olley on the reparation of the building:—

In reporting on the present condition of the town hall, we think it desirable to deal first with the westernmost part, up to points a few feet beyond the east wall of the assembly room, and then with the remaining or easternmost portion. The reason for this division is that the western portion is far the heavier, and has settled to a much greater extent, the fissures showing in the eastern portion being partly due to the drag of the heavier western section. The subsidence of the western portion, up to the limit above mentioned, has been from 6 to 12 inches, the greater subsidence having taken place in the west wall, especially at the south-west angle, and, since the recent operations, at the north-west angle also. This portion is, to a considerable extent, separated by serious fissures from the eastern portion. The fissures showing near the north-west angle are very serious, and there are various others along the west front and south return, as well as in some of the internal walls. The over-hang along the west front (especially near the centre) is also very considerable. It must also be remembered (and this is an important point) that two-thirds of the total subsidence occurred during the erection of the building, and that though the serious fissures thus caused were concealed, and to some extent made good, they were still sources of weakness, so that the fissures now visible gave a very inadequate notion of the defective condition of this portion of the building.

We have carefully considered the best method of dealing with this western section, and, bearing in mind the various movements that have taken place, the very serious settlements and resulting fissures, the considerable overhang of the west front, the deplorable condition of the north-west corner, and the nature of the subsoil, we are decidedly of opinion that the wisest and only safe course is to pull down, provide proper foundations, and rebuild. The subsidence has evidently been going on up to the present time, and during the last twelve months (according to our information) to a greater extent (proportionately) than before. This subsidence (with 18 feet of soft ooze under foundations before any weight-bearing stratum is reached), will, in our opinion, continue, and cause the building to go from bad to worse. With ordinary soils compression takes place, and a building soon reaches its bearings; but in this case we are sceptical as to the possibility of securing the requisite degree of compression before the building is utterly crippled, especially as there would, no doubt, be some lateral movement of the subsoil. We would further remark that even if effectual means could be adopted to prevent any further subsidence the west wall and its returns would still be both unsound and unsightly, and possess scarcely any elements of durability.

The condition of the eastern portion of the town hall, though not satisfactory, is much less serious than that of the western portion. There is one point here which should, we think, be dealt with at once. The heavier western section has evidently been dragging the eastern part with it, and the effect of this has, we think, been much aggravated by the ties that have recently been inserted in the hope that the lighter eastern section would assist in holding up and supporting the heavier western section. The result has evidently been just the opposite, and as it is desirable to save the eastern portion, we think the connection between it and the heavier western portion, should be severed as quickly and completely as possible. Various settlements have taken place in this eastern portion of the building, and it is instructive to note that these, as a rule, show internally just beyond the limits of the old town hall, indicating that the soil underneath the old structure had, in the course of time, been somewhat improved in its weight-bearing capacity. Apart, however, from the drag now on this portion from the western section, we do not consider its condition very serious, and are of opinion that (if this drag is removed) it may be made secure. The main reasons for the better condition (relatively) of this portion are no doubt—(1) that the weight is much less; and (2) that the subsoil is better, having less depth of ooze. No borings have been taken here, but there is no reasonable doubt that the sand slopes upwards very rapidly from the river. The borough surveyor informs us that in the shaft sunk near the north-west angle the upward slope of the sand bed was more than one foot from west to east in the 9-feet width of shaft. Certain works of repair would be required to this portion, and probably some amount of underpinning, so as to obtain greater spread in foundation without going down lower than the present concrete. But we believe that when these works have been carried out, and the western portion of the hall rebuilt, so as to act as a support instead of a drag, there would be very little further settlement.

The question of foundations for the western portion of the hall prior to rebuilding is, of course, one of the utmost importance. We are convinced that absolute security cannot be obtained on this site without taking the foundations required for such a heavy building down some 25 feet, so that they rest on the solid sand and gravel. This stratum may be reached either by piling or by cylinders, and we are of opinion that for the main walls cylinders are decidedly preferable in the present case. A few screw piles might perhaps be required at certain points under some of the internal walls, although for these internal walls generally all that is required for security is a wide bed of good cement concrete. The cylinders would be of cast-iron, in sections, and from 6 to 9 feet in diameter, as required. They would be filled with good Portland cement concrete (in which the concrete blocks already made could be used) and would form a perfectly safe and durable foundation.

As to the probable cost of these operations, we may remark that of course we can at present give no more than a rough approximation, as we have not had time to go very minutely into figures, and in any case it would be much more difficult to give an accurate estimate for work of this kind than for an entirely new building. Our opinion is that the cost would be approximately as follows:—Taking down west portion, 1,650*l.*; new foundations as proposed, 3,150*l.*; rebuilding west portion, 7,200*l.*; repairs, &c., to east portion, 600*l.*; total, 12,600*l.*

It may perhaps be thought that this estimate is a full one; and in fact we have wished to make it so, or rather, we have desired to lay before the Council, so far as our judgment goes, the full extent of the liability if the foregoing suggestions are carried out. There are, no doubt, other possible methods of dealing with the town hall, but we are strongly of opinion that they would involve great uncertainty and risk; and our belief is that the Council wishes now to apply, not a palliative, but a cure; to provide, not a possible, but a certain remedy. If it should be decided to adopt the foregoing suggestions, and to entrust the carrying out of the same to our care, we can

assure the Council that the matter shall have our best attention, and that we will spare no time or trouble in order to bring about a satisfactory result.

METHODS TO BE USED IN TAKING QUANTITIES AND MEASURING UP WORKS.

BY THE MANCHESTER SOCIETY OF ARCHITECTS.

(*Concluded from page* 172.)

Plasterer and Painter.

1. State description of materials, and keep the work of each kind separate.

2. Plastering on walls to be measured from the floor upwards, or from the point where each description of work commences.

3. Where cornices are lathed on brackets, measure ceiling and walls to the edge of the brackets only.

4. Where cornices are not bracketed, measure the ceiling full size of room, and the walls up to ceiling; all in super yards.

5. Deduct all openings 100 square feet and over; deduct materials and add labour (hollows) for net sizes of doors, windows, fireplaces, and other openings under 100 feet super.

6. Where ceilings are panelled and coffered, or coved, girth round all portions that are lathed, keeping circular work separate.

7. Ceilings plastered between spars, &c., to be measured across the spars and purlins, and even then kept separate, and described as such.

8. All work run with a mould to be measured lineal on the wall and the girth given, as cornices, rustics, strings, architraves, soffits, quirks, &c.; count all mitres, with the girth of mould they belong to; count mitres in panelled work.

9. All cornices, &c., lathed on brackets to be kept separate, and described as such.

10. All cast work to be counted, except running enrichments.

11. Enriched members to be measured lineal, with girth.

12. Modelling of enrichments to be, if special, so stated, and the models to be the property of the architect.

13. Ceilings or walls covered with panels, formed by small molds, to be measured super, with illustration or drawing, for "extra price over plain work;" larger panelling or special decorative features to be measured in detail.

14. Angles to pilasters, &c., if specially formed in cement or otherwise, to be so measured, lineal and extra to plastering.

15. Door and window frames, bedding and pointing, to be counted, and state material to be used; also flushing to inside of frames after fixing, or behind casings, window backs, or other work to be given.

16. Making good generally, and after plumber, gasfitter, bellhanger, &c., and chimneypieces, as an item, stating numbers.

17. Colouring and whitewashing walls, &c., to be in super yards, measuring over all openings under 100 super feet; if the work has to be pointed by the plasterer, state so.

18. Painting to include stopping and knotting, and to be given in square yards. Priming to be separate, if on work painted before being fixed. Painting to be girthed round all exposed surfaces, except as below.

19. Balusters, if ordinary square, and grids, gates, and other metal work painted on both sides, with bars about 5 inches to 6 inches apart, to be measured one surface only; if closer or slightly ornamental, 1½ surfaces; and for very close or very ornamental work, 2 to 2½ surfaces.

20. Windows to be measured each surface over full size of opening for painting frame and sheets, or else the frames counted, and the sheets, if large squares, counted; but if in small squares (as old-fashioned crown-glazing), then count the squares instead of the sheets.

21. Fancy or ornamental painting to be measured in detail, with lengths of mouldings picked out, gilt, &c. All work in parti-colours to be kept separate from plain work.

Plumber and Glazier.

1. The lead to be reduced to weight, and the different kinds of work kept separate, as gutters, flashings, valleys and ridges, and flats; the work requiring solder, as cisterns and cesspools, dressing over finials, and other fancy work; allow proper lap, as specified, to flashings, drips, and rolls; the net quantity of lead, as fixed, only to be measured.

2. All water, supply, service, waste, or other pipes to be given in lineal feet, with the weight per foot or thickness; the dimensions stated to mean in all cases, whether specified or not, the clear internal bore. The price to include all soldering and forming joints, wall hooks and fixings.

3. No allowance to be measured for sockets and joints in iron piping, down-spouts, &c.; but state whether flanges or holdfasts are to be included.

4. If pipes are to be laid in trenches in the ground, state so, and how, and whether plumber is to do the excavator's work.

5. Count all traps, and also all bends and shoes to down-spouts or soil-pipes, spitters from cesspools to spouts, rain-water heads, taps, plugs, overflows, wastes with plug and washer, water-closet and bath fittings (the pipes thereto and therefrom measured with the other piping), wash-basins, urinals, hot-water cisterns, and other special fittings, and in all such instances to give a clear, unmistakable description of what is required, or the price, exclusive of fixing.

6. Iron gutters and down-pipes to be measured in lineal yards; no allowance for joints, but elbows, stopped ends, &c., to be counted and described.

7. The different descriptions of glass, with thickness or weight per foot, to be given in superficial feet, assorting each into different average sizes, and keeping bent sheets separate. Curved or other special edges to be measured lineal, the glass being first measured the size such special shape has to be cut from. Special descriptions of work, such as lead lights, &c., to be described.

8. Pointing to flashings to be measured lineal and described.

9. Making good and leaving all perfect at conclusion of works, as an item.

Ironfounder.

1. The most suitable method is to reduce each description of work to weight, keeping columns separate from beams, small castings from large, and intricate ones, as railing, grids, &c., separate from plain ones; the cost to include pattern making; any fancy work to be specially mentioned, and the castings from each such pattern kept separate from others; the metal to be taken at 40 lbs. per foot super, 1 inch thick.

2. State whether price to include fixing. (*Vide* No. 45 in Carpenter.)

3. Special labour, as turning columns, coupling boxes, &c., to be given in detail.

4. State whether beams are to be tested, and if at contractor's expense and risk.

5. Bolts and other small fittings to be counted and described, with the labour necessary in preparing for and fixing them.

6. State whether lead or other material is to be found for running lugs, &c., and indicate the number of them.

7. Long bolts, tie-rods, &c., to be measured lineal, with allowance for head and nut, and count the number of nuts, and screwing, and washers.

8. Swing sheets, gates, &c., and their fittings, hangings, and fastenings to be fully described and counted, both for materials and labour.

9. In measuring wrought-iron beams and framework ascertain the weight of metal in plates and other shapes, adding the rivets and bolts, with the labour separate, on any particular forgings or cuttings.

10. All wrought-iron rolled or built girders to be fully described and given in lineal lengths, with section.

11. If painted before fixing, to be measured in full.

Slater and Tiler.

1. State size and description of slates or tiles, nails, and battens, and whether and how pointed underneath, and amount of lap.

2. The usage varying with respect to allowances at eaves for double course, and hips and valleys for waste, the Manchester Society of Architects purposes to measure slating net as finished, and to give the length of eaves for extra price of double course, and the length of each bevelled edge at hips and valleys, &c., for "single bevel cutting and waste," and also the bevel cutting where so done to land-gutters, &c. All openings of 100 feet to be deducted entirely, and any others, but allowing for labour as "hollows" below that amount down to 6 feet super, below which no deductions to be made. Any special cutting, as close hips, &c., to be separately mentioned and described.

3. In tile roofs, hips and valleys to be measured lineal, and fitting included.

4. Ridge tiling to be fully described and given in lineal yards, and state how to be bedded and pointed.

5. Pointing to overhanging eaves and gables in lineal feet.

6. Sweeping and cleaning out gutters, leaving all clean and perfect.

7. Circular slating, fancy courses, slating to spires, or other special work to be kept separate and fully described.

Sundries.

Floor or wall tiling, paperhanging, cooking and heating apparatus, bellhanging, and gasfitting are generally matters of separate arrangement with the tradesmen. If requisite to include the two latter, bellhanging may be given at so many bells with one pull and so many with two, the furniture being described and counted; gasfitting at so much per position, exclusive of meter, for piping and brass bits, or else measured in detail as for water-piping.

AMERICAN SANITATION.*

By JOHN B. GASS, A.R.I.B.A.

IN the following paper I propose to give a general account of the leading methods of sanitation adopted by American architects and engineers, noted by myself during a professional visit to America last year. Having had the honour of being elected by the Council of the Royal Institute of British Architects to the Godwin Bursary and Medal for 1885, I travelled with official letters and introductions to examine into and report upon American methods of building, construction, arrangements, sanitation, &c. My report on the latter subject, though probably not presenting anything new to specialists, may, I trust, be of some little general interest.

It is only of late years that much attention has been given in America to the sanitary arrangements of towns and buildings, and the better understanding of what precautionary measures are necessary for the public health. Architects and engineers recognise the importance of sanitary matters, and manufacturers are stimulated to develop appliances to meet the latest sanitary requirements. The American public mind has been stirred in these matters, and the National Board of Health at Washington, and the Boards of Health of the various States, are doing excellent service. The reports of the Washington Board, which (I believe) are in the library of the Sanitary Institute, and which I brought over for the library of the Royal Institute of British Architects, contain information of much value, though unfortunately the last report is only of small dimensions, owing to the limited appropriation of money granted by the Government. In many of the cities there are stringent sanitary regulations, which are very good, but, unfortunately, they are not always carried out, as the curse of the speculating and jerry builder hangs over America as well as England. Building inspectors are not always able to insist on a full carrying out of their regulations, and perhaps even building inspectors have occasionally the "itching palm" with which the American public service is so much credited. In one city, where the plumbing regulations are very strict, I was told that the purchasers of a row of good houses, on entering into possession, found that all the elaborate plumbing fixtures were without any service or waste piping at all.

As the ordinary system of city drainage takes rain and storm water in addition to foul water, pipes and culverts of large diameters are used. In hot and dry weather, which often lasts for a considerable time, when there is the greatest decomposition of sewage matter, there is no storm-water to flush; and there is also a decomposition of filth in the street water catch basins. There is also the difficulty of ventilation, and the storm-water makes an embarrassment in the treatment of the foul sewage. In some parts of Philadelphia the slop-water from the houses discharges into surface gutters in the streets. These are very objectionable, particularly in hot weather, when the smell is very offensive; or in frosty weather, when the foul water freezes. Many of the American cities are badly drained, and the disposition of the sewage is often a matter of great difficulty, owing to the sites of these cities being often very flat. There are very ingenious systems for its treatment and disposition, but in practically the majority of cases it is turned directly into the nearest river, lake, or sea, without any treatment whatever.

The connection of any good system of house drainage to the ordinary main sewer is trapped with "breather" pipe on the house side. This, where possible, is at some little distance from the house, and anyhow away from window or door; it is carried about 5 feet above ground, of good diameter, and with end turned downwards. In cities where the main drainage is only at the front of house and the closets, bath, &c., at back, it is necessary to run the pipes through the basement. This inside drainage is very common. The iron soil-pipe passing through cellar is carried, if practicable, in full sight along the face of cellar wall, or suspended from the floor beams. If it is carried under floor it is encased in strong cement concrete with sealed hand holes for cleaning. Where passing through foundation wall an arched opening is left, and the iron pipe taken at least 5 feet outside, where it is connected with the earthenware drains. If the ground is not solid the iron pipe is carried further and encased in concrete—this gives greater certainty of tightness and correct grading. When the trap disconnecting house drainage from main sewer is on the soil-pipe, and inside cellar wall, it is of iron and fitted with cleaner, the breather-pipe being carried outside to curb or fence wall with gird at end.

The ordinary system of city drainage being very defective, it is interesting to note a departure from it in the sewerage of the city of Memphis. Here is the best known and largest example of the application of the result of the investigations in various cities, by order of the United States National Board of Health. In these cities the main sewers were gauged to determine the actual size of pipes needed for the removal of the greatest amount of foul sewage matter only, produced under various circumstances. These gaugings (a full account of which was published in the Board's report for 1885, fo. 354) show conclusively that for foul sewage matter for a large population main drains of only small diameter are necessary.

Colonel Waring, of Newport, R.I., the engineer who designed the Memphis sewage scheme, communicated a paper to the Sanitary Institute in September 1880, giving a full account of this work, which is no doubt familiar to the members. It has now been in use over five years, and the practical working appears to have been very satisfactory. To recall the main features, I may state that Memphis is a city on the Mississippi, of between forty and fifty thousand inhabitants. The main drainage system is for foul sewage only, and when complete will have a total length of about forty miles. There being very few cellars, and the ground having a good natural fall, the drains were laid about 6 feet deep. No outlet drain from any house was allowed more than 4 inches diameter, the tributary mains being 8 inches and 6 inches diameter, and the two mains commencing from 8 inches diameter, and increasing to 12 inches and 15 inches diameter, all being of socketted glazed pipes. The two mains are joined together into a 20-inch brick sewer, which has switches turning the drainage into a 3-feet iron pipe for the high water outlet, and into a 20-inch iron pipe for the low water outlet, the extreme variation of level in the river being 35 feet. On the main lines, manholes have been put in at intervals. No house connection is trapped, but each has an unobstructed ventilator reaching to top of roof; this gives vent to about every 30 feet of sewer. Every slopstone, water-closet, sink, &c., has an independent trap; hopper closets are insisted on, the sanitary regulations are very strict, and all plumbing work is inspected by engineers. The whole system is flushed daily or half-daily with about 150 Rogers Field's well-known automatic flush tanks, supplied with town's water, and placed at the dead end of every branch to thoroughly flush each length; each flush tank discharging about 100 gallons in forty seconds thoroughly scours the pipes. The subsoil drainage is by agricultural drain tiles, 1 inch to 3 inches diameter, laid beside sewer and in same trench. These discharge into the nearest watercourse, or on very level ground into the main sewer, with special precautions against sewer water backing up. Storm water is removed by surface gutters with outlets through shallow conduits easily accessible.

On this system there have been official reports by Mr. Gardiner, for the Board of Health, New York State, and Mr. W. H. Baldwin, C.E., the latter dated March 29, 1884. The following is a summary of these reports with regard to the working:—"In the mains, from 10-inch and over, a deposit is found of fine silt, supposed to be mud and paper pulp; this is cleaned out once a month by rope and steel brush being dragged through from manhole to manhole. In the lateral sewers there are very few stoppages; where stoppages occur they are from schools or shops only, and in pipes 6-inch diameter and under, and caused by sticks or pieces of metal getting crosswise in the pipes. For stable washings catch-pits have been found necessary. A few T cleaning pipes have been inserted, and hand-holes are now put in all extensions about 100 feet apart. Some of the sewers are 2,000 feet from the mains, and the longest lines generally run about quarter full. Overflows had to be provided for taking the water in winter, when the water taps are left running in the houses to prevent them freezing. Neither in removing obstructions, in cleansing the main sewers, nor in connecting with house drains is the odour of sewer gas ever observed."

This system was adopted at Keene, N.H., and executed in 1882–83. I am informed that it is working well, though the greatest fall is only 4 inches in 100 feet, the lowest fall being one-tenth of an inch in 100 feet, and that line nearly two miles long. It is also being used in parts of Paris and other places, and may, I think, on a large scale be considered a success.

In the country districts, where there is no regular system of sewerage or convenient watercourse, house wastes are disposed of by means of cesspools, the commonest form of which is the "Leaching cesspool," which is only of use in sandy or gravelly soils, and should not be used where there is a chance of contaminating water supply. They are built circular, 8 to 12 feet diameter, of depth requisite to reach an absorbent stratum; the sides lined with dry wall of stone or brick, and the top drawn over dome-shaped, with manhole at top, covered with loose flat stone and earth over. Subsoil irrigation is being much used, the sewage being conveyed to tight cesspool or tank, having outlets to irrigation field or surface by a series of open-jointed tiles. Rogers Field's automatic flush tank is used most successfully, as also are ordinary tight cesspools placed at a higher level and let off at intervals. The tight cesspool with overflow at top is also in use, but, as the sewage water is not delivered intermittently or in large quantity, it is not successful.

To prevent damp in cellars or foundations, under-draining is resorted to, and formed with agricultural drain tiles of small

* A paper read at the Congress of the Sanitary Institute on Thursday last, September 23.

diameter, well graded, and laid with "muslin" joint or paper cap below level of foundation. This is kept separate from other drains, and discharges into watercourse if practicable, or, if connected with main drainage, is carried some distance from house, and tiles stopped at least 10 feet from connection, this length being filled in with very fine sand or gravel. When a gravel under drain is used it is excavated for as tile drain, and bottom filled in to about 12 inches deep with sand or fine gravel.

To prevent ground smells rising in house 6 inches clay puddle or thick coat of asphalte is put under floors and rammed in at side of wall.

Plumbing.—Lead is mainly used for plumbing in England, but in America iron takes its place, being used for soil-pipes, supply-pipes and wastes, except in cases where there are many bends, or in branches of small diameter.

The soil-pipes are generally of cast iron of extra thick metal, with turned socket-joints, made with oakum driven in tight, and finished with melted lead, which is tightly caulked after being put in place. Joints are also made with sal-ammoniac and iron filings; turned socketted cone-joints are used, and flange-joints, bolted together, with lead-washer, star-shaped in section, which flattens out when bolted up and forms a good joint. Wrought-iron soil-pipes in long length, with bolted flange-joints, are also used. The soil.pipes are usually coated with asphaltum, inside and out; some are enamelled inside, or dipped in patent solution, of which there are many sorts.

Owing to the severity of the weather in winter, it is often necessary to keep the soil-pipe inside the house or inside "plumbing tower," kept heated in winter. It is used as the waste for all the plumbing fixtures, the pipes being prepared with the necessary Y branches for connections. Where lead pipe is connected with the iron, a tinned brass joint-piece is inserted, caulked to iron pipe, and the lead pipe connected to it by a wiped solder joint. Under ordinary circumstances, 4-inch soil-pipes are generally found sufficient; in 3-inch pipes there is better flushing, but greater danger of syphonage upon lateral branches; this danger decreases by the use of larger pipes, being in inverse proportion to the diameter of pipe.

The soil-pipe runs up to the roof of full diameter, then for a length at least on the outside of greater diameter, using an increaser joint of 4 inches to 6 inches, which is said to give effective increase to the movement of air. At the top a spherical wire basket is placed to prevent obstruction. Ventilating cowls or covers of any sort are objected to by many as obstructing the current and increasing the friction, particularly so during calms or light winds.

The soil-pipes are carefully tested under hydraulic pressure, or by air pump and pressure gauge as used by gasfitters; the plumbing fixtures are afterwards tested by the usual peppermint or smoke tests.

Extreme simplicity of plumbing arrangements is advocated, and in some very large houses I visited carefully carried out. The water-closet is arranged to do duty as urinal, slop-sink, &c., and water drawn by housemaid from bath taps or stand pipes. All wastes and traps are exposed to view with absolutely tight blocking for every pipe hole, and no wood casings to closets, washstand, or bath. For water-closets the seat is formed of hard wood, on cleats at sides, and hinged to be turned back. Most of the water-closets are imported from England—the Brighton, Jennings', Hellyer's, and others being in use. The distinctively American ones are cleared by syphon action; the "Dececo" is on the principle of Field's flush tank, and seems to answer very well, but the trap cannot be ventilated, as it would interfere with the formation of vacuum before the syphon will act. There are others on the same general lines of varying values, some of which are arranged with air pipes to traps, which are kept closed by valve, except in case of under-pressure. Urinals are rarely found except in hotels and public buildings.

(*To be continued.*)

CHURCH BUILDING AND RESTORATION.

Aberdeen.—A Congregational church has been erected at the corner of Esslemont Avenue and Skene Street from the designs of Messrs. Matthews & Mackenzie. The style adopted is Italian Renaissance. Two kinds of granite are used in the building, the rock-face work in the corners and lower part of the wall being built of the dark-grey Rubislaw stone, while the dressings and more ornamental work are formed of light Kemnay granite. On the north side is a semicircular apse. The projecting porch at the south-west corner, which covers the main entrance, is intended to form the base of a tower or spire, surmounted by a dome, which formed part of the original plan, but has been temporarily abandoned for lack of funds. The church is 87 feet long, including apse, and 33 feet wide, and the height to ceiling is 32 feet. Boyle's concealed ventilators have been adopted. The contractors are, for mason-work, Mr. Leslie Smith; carpenter-work, Mr. William Dawson; plumber-work, Messrs. Thom & Strachan; plastering, Messrs. Kirk, Piggot & Co.; slater-work, Mr. James Wilson; painting, Messrs. John Mason & Sons. The total estimated cost of the building is about 3,000*l.*, exclusive of site.

Aberdeen.—All visitors to Aberdeen know that Oldmachar Cathedral is the most interesting example of Mediæval work that is to be found in the Granite City. It is used for Presbyterian worship, but it has the disadvantage of having no accommodation for classes and other meetings. A new hall, to be called St. Machar's Hall, was lately projected for that purpose, and the building, which is in Dunbar Street, will shortly be completed. In style the building corresponds with the cathedral. The main hall measures 56 feet by 38 feet, and will accommodate 500 people. The roof of the hall is open-timbered, and of a very high pitch, so as to give large internal cubic space, the height from the floor to the lower ties of the roof being 21 feet, and from the floor to the ceiling 28 feet, while the height of the side walls is but 18 feet. The architects of the new hall are Messrs. Ellis & Wilson, Bridge Street, Aberdeen

Chester.—St. Peter's Church is to be rearranged according to plans by Messrs. Douglas & Fordham, the contractor being Mr. W. Freeman. The tower is to be repaired, the west gallery and old vestry will be removed, new windows will be inserted on the south side, and where needful other windows will be releaded and reglazed. All the whitewash on the walls is to be scraped away. The Ecclesiastical Commissioners have granted 2,000*l.* towards the cost.

Edinburgh.—The memorial-stone of the new Baptist church in East King Street was laid on Saturday. The building is Gothic in style, and measures 31 feet by 55 feet. Seating accommodation has been provided for 250 persons. The architect is Mr. D. A. Crombie, Edinburgh, and the contractors Messrs. John Jack, mason; A. Henderson, joiner; W. Thompson, slater and plasterer; and W. Kyle, plumber. The church is expected to be ready for occupation in February.

GENERAL.

Mr. Watts's collection of paintings which he has bestowed to the nation will be shortly exhibited in the Castle Museum, Nottingham.

The National Competition Drawings have been on view during the week in Manchester. The local school of art was exceptionally successful this year, having won two gold medals, nine silver medals, and eleven bronze medals, with other prizes.

The Pictures sold out of the exhibition at the Manchester Art Gallery up to the end of last week numbered 47, of the value of 3,660*l.* 11*s.*

The Electric Light was on Saturday introduced into two of the rooms of the Walker Art Gallery, Liverpool.

An Exhibition of ecclesiastical art will be opened on Tuesday next in the Pavilion, Brighton. It will comprise both ancient and modern examples.

Excavations in Kertch have brought to light in the Woronzafskaia the marble basement and pedestal once supporting a statue. The inscription on one face of the pedestal, still in perfect preservation, records that the missing statue was raised by Marcus Aurelius in honour of Tiberius Cæsar.

The Howson Memorial Fund, amounting to 2,200*l.*, is (after paying for a memorial brass) to be applied towards discharging the liability incurred by the late Dean of Chester on account of the restoration of the cathedral.

Professor W. M. Conway is, during the next session, to lecture in University College, Liverpool, on the history, arts, and antiquities of Assyria and Chaldæa.

Major Cole, R.E., of the Survey of India, will probably succeed the late Lieutenant-Colonel Morant as consulting architect to the Government of Madras.

St. Thomas's Church, Stourbridge, is to be altered and enlarged. Parts of the building are in a dangerous condition.

A Petition from the citizens of Versailles, drawn up by M. Dussieux, one of the professors at the Military School of St. Cyr, prays the Senate and Corps Législatif to take steps for keeping the Château and its annexes in proper order.

A Public Meeting was held in Stirling, on Monday, when it was resolved to apply for a building grant for the erection of a new science and art school.

The Monument erected by public subscription over the tomb of Henri Conscience in the Kiel cemetery at Antwerp, was unveiled on Monday. The monument is the work of the sculptor Joris (to whose chisel is due also the statue of Conscience before the Antwerp Town Library), and represents the great Flemish writer in a recumbent position, with the lion of Flanders at his feet, and a broken column behind him.

The Architect.

THE WEEK.

A few weeks ago the Liverpool Corporation decided to annul the contract entered into with Mr. T. S. Lee for the bas-reliefs of St. George's Hall. The arrangement of the affair belonged to the Finance and Estate Committee. It was proposed at a meeting of the Committee that the decision of the Council should be rescinded and the matter be reconsidered after the second panel had been fixed. But an amendment was also proposed to the effect—"That the town-clerk arrange for the payment, without prejudice, to Mr. Stirling Lee, in full discharge of all claims under the contract, of the balance which would be due for the two panels if calculated on the basis of 500*l.* each." There was an equal number of votes for the motion and the amendment, but the chairman gave a casting vote against the amendment, which was negatived. A second amendment was then proposed, viz.—"That the contract with Mr. Stirling Lee having been terminated, the town-clerk be authorised to arrange, without prejudice, for the payment of the sum of 250*l.* in final settlement of all Mr. Lee's claims in the matter." It was carried by a majority of two votes. Afterwards it was put as a substantive motion, and adopted. This is no doubt a grievous disappointment to a young artist, but the opposition to the panels must be attributed in a great measure to the arrogance of some of the members of the Council, who acted as if none of the ratepayers had a right to express an opinion on their arrangements.

Among the celebrities who have been discovered after their death is Hector Berlioz, the composer. In his lifetime he could not subsist as a musician, and he helped to support himself by writing notices of plays, operas, and concerts for the newspapers. It must have been hard to bear when the composer found his articles quoted by *littérateurs* who were puzzled about the technicalities of a work, without a word to suggest that France had also a great musician. The venerable M. Signol some years ago made a splendid design, in which all the men of genius who led a life of suffering are grouped together. In the foreground he placed his friend Hector Berlioz, and he is shown prostrated on the ground, as the artist once saw him. But if posthumous fame can be of use, the shade of Berlioz may rejoice. His works are now admired in many countries, and they have their special worshippers. As a proof that the resuscitation has received official approval, a statue of the musician is about to be placed in one of the squares of Paris. It is, however, a very small square—probably the smallest in the city. The Square Vintimille is, however, in one of the artistic quarters of Paris. The statue is by M. Albert Lenoir, and will be unveiled on the 17th inst.

We have already described the conditions of the international competition for the façade which is to be added to the cathedral of Milan. The jury has been appointed. The only foreign members are Mr. Waterhouse, R.A., and two Austrian architects.

It is satisfactory to find that the part of Richmond Hill belonging to the Duke of Buccleuch will become public property, as the Richmond Vestry have obtained borrowing powers. The sum allowed to be raised is 15,000*l.*, which is only half the purchase money. It will apparently be necessary to sell a part of the land, which is not a satisfactory arrangement, and it was only suggested to restrain the opposition. In the northern suburbs another addition to the open spaces is likely to be secured. It was agreed at Monday's meeting of the Hornsey Local Board that a Bill was to be introduced next session authorising the purchase by the Board of Churchyard Bottom Wood, which belongs to the Ecclesiastical Commissioners. The sum of 15,000*l.* is to be borrowed, and 10,000*l.* is to be obtained from the fund administered under the City of London Parochial Charities Act. It is to be hoped an opposition like the one raised in Richmond may not appear before the Parliamentary Committee. Some alteration in procedure seems necessary when the Richmond people can borrow 15,000*l.* by appealing to the Local Government Board, while the Hornsey people must go through the costly process of obtaining an Act of Parliament before they are allowed to borrow a similar sum.

It is easy to be wise after the event, and the conduct of the quarry-owners, in allowing people to visit the scene of the disaster at Crarae, is now generally condemned, as if the consequences were to be foreseen. Blasting on the scale of 50,000 tons of rock, and with seven tons of powder, is not an everyday affair; and hitherto "choke-damp" has been supposed to be innocuous in the open air. The interest attached to the Grotto del Cano because of its dangerous air is suggestive of the rarity of the phenomenon. With over 15,000 lbs. of powder an enormous quantity of carbonic acid gas and carbonic oxide gas was generated, and the day being heavy the gases were not dispersed but sank towards the ground. In ordinary blasting there is often a disagreeable smell, but no one would think of considering it dangerous. What mainly causes accidents is careless tamping. Henceforth visitors will hesitate about entering a quarry, although on occasions of big blasts they have done so without any risk. One of the contractors suffered at Crarae; and, while the catastrophe is to be lamented, it is only right to say that no responsibility rests on anybody connected with the quarry.

The Eiffel tower is likely to afford plenty of excitement to Parisians before it is completed. The first step is about to be taken in ascertaining what curve is to be given to the sides. A chain or cord suspended between two points forms a catenary curve corresponding with the weight. Now it is supposed that something of the kind also occurs when the suspension is vertical. The engineers have therefore arranged to cause a balloon to ascend to the height of the proposed tower. From the boat ropes will be hung to the ground and fixed there. From their curvature the contour of the tower will be derived. It is a novel experiment, but as there is some difficulty in arranging the slope of an ordinary lighthouse, we cannot expect that a colossal tower, made of iron plates, is to be designed forthwith without much deliberation.

Mr. Thomas Webster, who died at Cranbrook on Thursday in last week, exemplified the form of art that was once supposed to be essentially English. His pictures were of a domestic character. There was nothing in them to shock anybody's susceptibilities, and they were easily understood. He was at his best when painting boys; but if compared with those dashed off by John Leech, it will be evident that the Academician's boys are rather unreal. It is to his credit, however, that he never attempted to suggest the superiority of the "Children of the Nobility" in his pictures, and this is the more remarkable if we remember that he was brought up in an atmosphere that was favourable to the creation of a caste feeling. His father was a domestic in the palace, and he had no higher ambition for his son than to make him a singing-man in a royal chapel. But, like Hollins and Callcott, the young Webster preferred painting, and found his way into the Academy schools in 1820. He obtained the medal for painting in 1825, and the same year he was successful with a little picture exhibited in Suffolk Street. From that time forward he might be considered fortunate, if judged by the standard of those days, when 20*l.* was an acceptable price for a painting. His best picture is the *Village Choir* in the South Kensington Museum. It is an illustration of a passage in Irving's "Sketch Book," and in its way it is as characteristic of perfunctory performances as Hogarth's print of *A Playhouse Orchestra.* Although his subjects are of so popular a kind, the print-sellers did not care to speculate in engravings from them. It was reserved for the Art Union to publish *The Smile* and *The Frown.* Mr. Webster had his full share of academic honours and offices. In 1840 he became Associate, six years after he was made Academician, and he enjoyed the dignity for thirty years before he retired.

THE SANITARY INSTITUTE.

NOW that the meeting of the Sanitary Institute at York is among the things of the past, we can consider how much was gained by sanitary science from the proceedings. As usual, there were two classes of papers. One might be described as the kaleidoscopic. The papers in that class resembled those which were heard before, and which will be heard again ; but there was supposed to be novelty in the re-arrangement of the stock subjects. The second class was made up of a few papers in which the writers endeavoured to increase the stock of knowledge.

It is known by this time that the Sanitary Institute differs from other ambulatory societies in the facilities it offers to certain of the members to become trumpeters of their fame. The British Association for the Advancement of Science, which was the first to introduce the principle of roving, placed science before scientists. The reverse plan is adopted by the leaders of the Institute, and it thus forms one of the most ingenious modes of advertising.

Practice has helped to make some of those gentlemen most admirable actors. They can be equal to any occasion. This year a few even tried to raise a laugh, but then humour is supposed to be a characteristic of people who are benevolent in acts. The joking had, moreover, an odd effect when introduced among speculations about keeping down the death rate. Mr. William Whitaker, B.A., F.G.S., Assoc. Inst. C.E., Assoc. Soc. Medical Officers of Health, was one of the successful aspirants. He found himself in the presidential chair of a section, and it was necessary to deliver an inaugural address to his disciples. He began in this style :—"I must, at the outset, express a hope that no one will expect me to be three single gentlemen rolled into one, able to discourse on chemistry, on meteorology, and on geology. Rather must I follow the advice given to the cobbler, and stick to the last." It is needless to say the well-drilled occupants of the seats near the punster-president were tickled by the wit, and encouraged their chief to attempt further efforts of that kind. He did not disappoint his supporters. He related his adventures : how on occasion "my nose (and most people can speak through the nose) said sewage !" and finally referred to a feat of one of the members, who "claims to have taken over twenty-three millions (of microbes) in eighteen months, but then he took them in hot water, which, perhaps, they may have relished less than he did !" This is recreative science with a vengeance.

The member who so heroically extirpated organisms has not claimed the renown that is due to such a feat. But it is difficult to resist the conclusion that it must have been Mr. Mansergh, for, as a mighty water drinker, he advocated the duty of every adult swallowing three or four pints daily, and assured his audience that it was easy, with the aid of a little imagination, to accept hot water as hot punch at night. A pamphlet was distributed on this important discovery.

Mr. E. C. Robins's humour took the form of as close an imitation of Mr. Tupper's philosophical aphorisms as is possible when the type cannot be set up as verse. The reader can, however, make the experiment for himself, and it will be evident how successfully the cadence and wisdom of the originals are reproduced in sentences like the following :—"Is anything more brilliant than the beaming face of an infant when it first finds the use of its legs and feet?" "Some women are weaker and smaller than others, for it is not exclusively the characteristic of the well-born." "Beauty cannot grow out of deformity, nor thrive as the semblance of disease." "The lady's riding-horse and the common cart-horse have been compared." "Nothing is more characteristic of good breeding than the performance of frequent ablutions." But the whole address is no less suggestive of poetic sententiousness and sanitation.

The humour of Mr. T. Harnett Harrisson approached the tragic. We can only give one instance. It appears that 1 in 700 of the members of sanitary boards belongs to that profession which is supposed to be so nearly allied to the doctor's. Mr. Harrisson moralised on the phenomenon in this fashion :—"If it is astonishing that life agents are so few, what will be thought of the fact that the agents of grim death himself appear among those elected as members of boards of health? Men who absolutely live by death, whose business becomes more lively as the epidemic becomes more deadly. Men who would only be expected to be found serving as promoters of a Public Disease Act. Men whose regular occupation it is to carry us from our houses to our last homes feet foremost ; who provide for us our 'customary suits of solemn black,' and whose crocodile tears are charged in the funeral bill. It is a horrible revelation, but of the 2,796 members of sanitary boards four of them are undertakers. And it is thought the undertaker comes appropriately at the end of all professions." After reading this soliloquy on the coffin-maker we are able to sympathise with one of Mr. Harrisson's correspondents who wrote :—"I am at a loss to understand any possible benefit that can accrue to the community from such statistics"—but the directors of the Sanitary Institute apparently know better what is useful.

It is time, however, we turned from the hilarious efforts of our instructors to the serious discourses. Since the talk about sanitation began the working plumber appears to have considered that it would be a good joke to perpetrate all sorts of blunders in laying pipes and apparatus. He feels he is watched, and he likes to show that he can evade detection when there is a scrutiny of his work. It is difficult otherwise to explain the defects which are revealed in modern work. All the blame is certain to be thrown on architects. Captain Douglas Galton related a case at York which occurred most opportunely a fortnight before. The Council of the Girls' Public Day School Company (of which the Captain is a member) directed that the drainage of all their schools should be overhauled. The report on one of the largest schools was as follows :—"To a great extent the drains not only fall the wrong way, but are absolutely without any jointing in many cases. In another case the pipes do not meet within two inches, and here a joint has been made with zinc and string ; this is under the kitchen." It appears the school was designed by an architect who has gained eminence by buildings of that class. The only explanation Captain Galton can offer for so serious an error is, "that the architect cannot have understood much of sanitation ; for any other supposition would imply that he cared little for the lives of the hundreds of children who were to be congregated in the building."

Nothing appears too strong for utterance against an architect at a meeting of the Sanitary Institute, for, although architects may be present, they are mute when their fellow members of the profession are attacked. Is it not reasonable to suppose that since it is an impossibility for an architect to be always on the spot during the whole of the time when a building is in progress, the defects in the girls' school arose during the absence of the architect? In every building much must be left to the honesty of the builder and his workmen, for even when a clerk of works is employed (which may not have been the case at the school) he cannot be simultaneously in all parts. We might, with almost as much reason, blame Captain Galton and the Council for the defects of the drainage. They must have examined the plans, and why did they fail to observe that the drains fell in the wrong direction? It is also likely that a Council wherein sanitation was so well represented did meddle with the arrangements for drainage, and, as happens in such cases, the men acted wrongly in order to show their respect for that kind of superintendence.

This year the architects were let off easily, for the only story that could be raked up against them was Captain Galton's. The doctors and medical officers of health occupied the position which was heretofore held by architects. It appears sanitary opinion is now divided about the expediency of allowing medical officers of health to retain their business as general practitioners. Doctors are only human, and, in spite of all we hear about the sacrifices they make to insure the health of the public, we find on examination that they are not more oblivious of their own interests than architects. They are even willing to ignore the public health for the sake of a mere point in professional etiquette. It is said, for instance, that the notification of infectious diseases is an important factor in preventive medicine, and, where practised systematically, leads to an abatement of the death rate and a diminution of diseases. But one of the objections to it is that, according to a speaker, "it disturbs the relations of medical attendant and medical officer of health." Another representative of the

medical profession at the York meeting stated that "on the one hand, there is a feeling amongst practitioners against being required, under penalty, to notify the existence of cases of infectious disease amongst their patients to one who is much junior to them in the profession; on the other hand, there is a dislike to notifying cases to a 'rival practitioner.'" The feelings and dislikes by which the community is sacrificed have their sordid side, for the doctor who describes them suggests that if medical men received a fee for notification, the disturbance might be got over! We are also informed that "local acts have been opposed because they impose statutory obligations upon medical practitioners." We learn, too, that the Local Government Board has been often compelled to send a skilled inspector to a district, in order to free it from the disease which occurred, because the medical officer of health, being a practitioner, and considering his private practice first and his public duties last, supported the opponents of sanitary improvements. When we find that a President of the Local Government Board would not agree to sanction any permanency of tenure for officers of health, because he was afraid they would become indolent or neglectful of duty, we may congratulate ourselves that there is some other cause for people dying than the want of understanding much of sanitation by architects. We are desirous to see an efficient administration of sanitary laws, and, as far as is requisite, by the employment of doctors; but we cannot forget that the prejudice against architects is mainly due to medical men, and that when they set up as the guardians of public interests they were seeking their own.

When Dr. Poore lectured on the life and work of Bremontier upon Saturday last, was he reading a lesson to those sanitarians who are perpetually thrusting themselves before the public? How many people have heard of that man's name? But he was one of the greatest benefactors to his race. Bremontier was born near Rouen about a hundred and fifty years ago, and during the greater part of his life he was a sort of county surveyor. In his day the dreary stretches of country known as the Landes were supposed to be as irreclaimable as if they were African deserts or Irish bogs. Bremontier set to work to study the question as if it were his duty as a citizen, for it had no connection with his office. He came to the conclusion that resinous trees, if planted, would in time aid in consolidating the sand. He did not take to spouting on platforms throughout France, but at his own expense he made experiments. Bremontier was able to demonstrate his theories among the wild dunes, and Napoleon, who would have been indifferent to the finest essays on the subject, was convinced and took up the work. It has since been continued, and the value of the improvement can hardly be credited. We are told that in the department of Landes there were 900,000 acres of uncultivable land in 1834, while now the area is diminished to 340,000 acres. It is not only the product of the reclaimed land that has to be considered, but roads, canals, and drains can be made through the district without any risk of destruction by the moving mountains of sand.

It is refreshing to meet with a paper like Dr. Poore's among so many egotistical productions, which are as barren in their way as the old Landes. Another that is welcome is Mr. Roberts's "Scheme for Defining Local Climates by combined Meteorological and Phenological Observation." The word "phenological" is so new that it is not to be found in the latest English, French, or German Dictionaries, although it stands for something that is not new. Every one has heard of a floral clock, but it is also supposed to be practicable to take flowers as indications of more than time. There is, for instance, a relation between certain kinds of vegetation and elevation. The relative dampness or dryness of the soil and atmosphere of two districts might be inferred from "a single natural order, such as *Ranunculacea*—the marsh marigold to the traveller's joy." Temperature may also be gauged by the survival of sub-tropical plants. Different species of plants are differently affected by atmospheric impurities, and it is supposed they can become more trustworthy evidence of the purity of the air than ozone tests. Rapidly-growing trees indicate prevailing winds. Round the coast trees lean inwards, but inland trees are most affected in their south-west aspect. The relative prevalence of leaves and flowers has much to do with the absence or presence of sunshine. This way of becoming a climatologist resembles that in vogue in the Forest of Arden, where tongues were found in trees.

Dr. Frankland the Younger read a useful paper descriptive of the results of an application of Koch's methods for determining the number of micro-organisms in a given volume of water. Instead of supplying such adjectives as "clear," "turbid," "slightly turbid," to characterise water, the degree of reduction of the micro-organisms can be stated numerically. Thus, one cubic centimètre of water taken from the Thames at Hampton in January contained 45,400 organisms. After filtration the number varied from 4,894 to 159, according to the company that filtered. The practical conclusions drawn from the inquiry are, first, that great storage capacity is advantageous, as there is more chance of deposition; second, that it is only the fine sand in filter-beds which is effective in removing microbes; third, that the slower the filtration the more perfect it becomes; and fourth, that filtration media lose their power of retaining microbes, although old sand as well as new produces water that appears clear when tested by the eye alone. Frequent renewal of sand is therefore necessary.

To what extent the microbes are dangerous to health remains an open question. Professor De Chaumont says that inquirers are working in the dark, and will continue to do so until the connection between the organisms and particular forms of disease can be made out. There are said to be microbes which are of use as agents in promoting the healthy action of organised beings, as well as others which are the opposite. "Our cue," says Professor Chaumont, "would seem to be to help the friendly microbes and to fight those that are our foes." Attempts have been made in a politic way to set one class against the other; but the great difficulty is to recognise the differences which constitute friends and enemies. As regards water, the desire at present is to get rid of good and bad microbes with equal impartiality.

The tests for organisms do not seem to have been applied to the rain-water filtered on a principle devised by Surgeon-Major Pringle. One peculiarity of this mode of treatment is that the two chief constituents of the soot (cinder and pure carbon) are separated. The soot carbon, or "sursum," is believed to have a marketable value as a material for making a black pigment that is said to excel those in use, while the cinder serves for the coarser blacks.

This year much was said about water at the Institute meeting. The most remarkable communication was the address of Mr. Baldwin Latham. In it he ran counter to the general belief concerning the advantages of drainage. Efforts have been made of late to secure as much dryness as possible, and rain is often regarded as an unfriendly visitant. Adopting the old theories on the subject, Mr. Baldwin Latham maintains that a dry winter is often the precursor of disease. According to him, that part of East London where the subsoil water was lowered by the main drainage works was the greatest sufferer during the cholera in 1866, and in previous visitations there was lowness of water from other causes. The conclusion of Mr. Latham is that "the death rate from year to year fluctuates in a very marked manner with the fluctuations of the ground water. The most healthy periods are those in which there is the most ground water, and the least healthy are those in which there is the least ground water in any year."

It is unfortunate that the experts who are competent to argue a theory of that kind keep aloof from the meetings of the Sanitary Institute. There may be something important in what Mr. Baldwin Latham says, but what would Mr. Hawksley say to it, and how far would his mountain of statistics bear it out? If so close a relation can be traced between dryness and disease, then too much money is being misspent every year on drainage.

The address is, however, suggestive of the state of sanitary science to every fair-minded observer. Our knowledge is limited. Sanitarians will not agree to this, and in consequence enormous sums are laid out in an unprofitable manner, and what is done in one year runs the chance of being condemned as useless in the next year. But, from its constitution, the Sanitary Institute must conduct its operations as if they were all of a certain kind, and however some interests may be served by that mode of action,

sanitary science would be the gainer if the example of scientific societies could be imitated by a lesser affectation of infallibility.

FRENCH ARCHITECTS AND WORKMEN.

THE discourse which M. Wallon, the principal secretary of the French Société Centrale des Architectes, delivers at the annual congress always receives the attention of architects, builders, and workmen, owing to the extent of the relations of the Society, and the personal interest which M. Wallon takes in even the humblest of the prizemen. The address which was read at the last congress having been printed, we give a translation of the principal portions.

Our prizemen to-day are some scholars, archæologists, and artists of the schools of Athens and Rome; some students of the Ecole des Beaux-Arts, and of various public or private schools; some artists who have distinguished themselves specially in the industrial interpretation or in the execution of compositions of masters; and, finally, some members of the great family of builders, contractors, foremen, and workmen, that we are glad to see around us every year, in order to render homage to their labour, courage and devotion.

The French Schools of Athens and Rome.

Athens and Rome, the Classic lands of civilisation, are the means of combining, in the study of the past, the scholars who issue from the Ecole Normale, and our brethren of the Ecole des Beaux-Arts who have won the Grand Prix of architecture. There they perfect themselves. Bringing together their knowledge of the ancients, their artistic sentiment, and their skill as draughtsmen and constructors, they go about exploring the two countries which appear to possess inexhaustible treasures. For some time past our students in the Villa Medicis have judged that Italy was insufficient for the completion of their studies, and they journey to Greece in order to discover the secret of that immortal beauty before which the whole civilised world bends in admiration.

That admiration is not, however, always accompanied by gratitude. But for Frenchmen Greece continues to be Ancient Greece. We are always glad to gaze on a country which has suffered so many vicissitudes, to meet a people who, like ourselves, have struggled and suffered for independence, and to behold the descendants of our illustrious masters in literature and art. Greece evokes in us memories of Phidias and Homer; we feel towards her that devotion which belongs to what is holy, and she excites in us that sympathy which we have for the feeble and the oppressed. And when recently the storm was about to burst, France was alone among the nations in displaying friendship towards that land. We ran the risk of raising the ire of some great Powers. Considering our relations with Greece, we owe something to the scholars of our school in Athens, who by talent and works have so well upheld the prestige and renown of France in the cultivation of *belles-lettres* and art.

M. Wallon next described the works which gained the rewards of the Société Centrale by students of the schools in Athens, Rome, and Paris. He then passed to the representatives of the art industries:—

Art Industries.

Last year, said M. Wallon, we offered a recompense to M. Guilbert Martin, whose mosaics are to be seen on the great staircase of the Louvre and in the Panthéon. This year the committee has selected a veteran among the architectural sculptors, Desire Hayon. He was born in Paris in 1815. The son of a mason, he was apprenticed in his tenth year, so that he has laboured for sixty-one years. Think of all the works on which he has been engaged, from the monument of Louis XVI. in the Place de la Concorde to the decoration of the new Court of Appeal that he is preparing to-day, under the direction of M. Daumet! The late M. Duc took notice of M. Hayon when he was working as a modeller on the ornamentation of the Column of July. From that time M. Hayon was kept attached to the architect, and co-operated so closely with him as to become his *alter ego*. In going over the galleries of the Palais de Justice, the Hall of the Pas Perdus, the audience-chambers, and the other parts of the building which were constructed or restored by M. Duc, we are everywhere struck by the unity of style that is seen in the ornament. It is simple, often it is elegant, always it is pure and beautiful, and while recalling the antique, it is distinctly French in style, for with us distinction and style have never been wanting. This sculptured decoration is the work of Duc and Hayon.

We find M. Hayon aiding Duban in the works of the Ecole des Beaux-Arts, where we now are; in the restoration of the Château de Blois, that charming example of French architecture which we owe to the conservation of Duban, and on which the master displayed such marvellous skill. Duban deserves to be remembered, and his restorations should always be treated as *chefs-d'œuvre* by his successors.

We meet with M. Hayon alongside M. Vaudremer at the remarkable church of St.-Pierre de Montrouge and the monument that is commemorative of the battle of Champigny; he is found with M. Constant Dufeux at the monument of Dumont Durville; with M. Coquart at the monument of the Generals Lecomte and Clement Thomas; with MM. Bailly and Godebœuf in numerous works; with M. Daumet at Chantilly, decorating the principal gate of the château and the pedestal of the equestrian statue of Constable Montmorency, the work of the director of the Ecole des Beaux-Arts, M. Paul Dubois.

During this long career, of which I can refer to no more than a part, M. Hayon has never ceased to be a modest and conscientious artist, working with a disinterestedness that is rare, indifferent to that fortune which should be the meed of such ability and talent, and preferring to satisfy his instincts as a decorative artist in the accomplishment of the numerous works that were confided to him.

The rewards gained by the apprentices of the Municipal School and by the masons and stone-cutters were described in succession by M. Wallon. He was able to announce that on the last occasion a contractor had come to him to announce that he resolved to engage the apprentice who had gained the prize for joiners' work. The director of the school also stated that the prizes of the Société excited a remarkable emulation among the students. M. Wallon followed with notices of the prizemen among the—

Building Contractors.

This year, said M. Wallon, the Société recognises the services of M. Hyacinthe Charles Mozet, president of the Chamber of Masonry-Contractors, and president of the Council of Administration of the Group of Syndical Chambers of Industry and Building belonging to the City of Paris and the Department of the Seine.

Beyond his official titles, which testify to the confidence and esteem of his brother contractors in the various branches of the building trade, M. Mozet as a practical man possesses claims on our recognition. He worked under Viollet-le-Duc at Notre Dame, Pierrefonds, and elsewhere; he has also been engaged in the restoration of numerous cathedrals throughout France. Formerly he served as one of the judges of the Tribunal of Commerce and as president of the section of building; he was also a member of the jury of the International Exhibition of 1878, and received the cross of the Legion of Honour and the Academic palms as a reward for his works, his knowledge, and his services to his countrymen.

Imitating the example set by M. Leclaire, the painter, and by MM. Goffinon, Babbas & Co., M. Mozet with his partner M. Delalonde had tried the experiment of dividing the profits with his masons. In spite of the condition of business, the result has been most satisfactory.

The Société offers its medal to M. Mozet as a testimony to his exceptional qualities as a contractor, to his honourable conduct, and to his self-sacrificing efforts for the amelioration of the condition of the workmen in his employment.

Building Workmen.

From masters the next step was to workmen. M. Salleron founded a medal, which is to be awarded to a foreman having at least ten years of service in the same firm. There is great competition for the medal, and, owing to the difficulty of making a selection, several medals have been granted. The first was awarded to M. Collet, a joiner, who has been for forty-three years in one establishment. A quarryman named Cochard has served for thirty years. Another quarryman, C. P. Guyot, has thirty years' services with M. Derville & Co. It was under his direction the great monolithic columns of the Opera staircase were got out, and the columns for the galleries on the river side of the Louvre. The ancient quarries of cipollino marble at Negrepont were reopened by him, and his operations extend from the Pyrenees to Carrara, in Greece and in Belgium. In the south he has from 250 to 300 men under his control, and he is able to boast that not a single fatal accident has occurred on his works. M. Brocard, a contractor, puzzled the Société by sending up a batch of eight foremen, who were with him from twenty-two to forty-two years. The youngest had doubly qualified for the medal. A worker in iron was able to show a certificate of even longer service, as he was forty-six years in the same employment. Considering the number of changes which have occurred in France, and the want of inhabitativeness which English phrenologists say is a characteristic of the French workmen, the lengthened periods of service which the prizemen of the French society have gone through become very remarkable. It is also evident that there are more examples of fidelity in French workshops than people in this country supposed. But there are fears of the new doctrines which are arising among the working classes, and on those occasions M. Wallon makes it a rule to raise a warning voice as the representative of architects, whose position makes them

equally interested in the happiness of workmen. On the occasion in question, he said :—

"France has much to recover. She needs the efforts of all her children—in arts, in literature, in science, in i his own sphere every one should labour for her.

"Let those present preach by example, by contin uin work, by inducing others to love labour, and to become distinguished by probity. Let them shun in their workshops the fatal doctrines which have led so many astray. Let them meditate over what is said on the subject in Germany :—'The friction, the perpetual antagonism between capital and labour in France is so favourable to us,' says Dr. Rommel, 'that many people believe it to be the work of instigators who are paid by us.' It is in this light we should regard the men who go everywhere sowing discord, raising the tempest, and exciting bitterness, with the object of creating discord between employers and workmen. They are labouring against your interests and those of the country. They are committing treason against France.

"Where is the enemy? Is he to be found among the employers, whose lives of courage and honour we have rewarded to-day? Workmen themselves they can understand what they needed at one time, and they try to render your struggles less painful. There is no doubt that life is hard for you, but you are not the only sufferers. In this school of art where we are, which is so rich in masterpieces, and which in its seductive beauty promises nothing but satisfaction and happiness, we who were students can say that life was a continual struggle against an uncertainty that was cruel. Labouring during the day for a livelihood, the students have to devote their evenings, and even their nights, to preparations for examinations and competitions. Have not those artists their share of suffering and misery? But they do not complain if they have that sacred flame which gives courage to accomplish superhuman tasks, which ennobles and makes us intoxicated with a life of successes and sacrifices, but which sometimes consumes and kills the possessor. I have no wish to make little of the sorrows of the workmen, but it may be worth remembering that the capitalist who passes by has also anguish and misery to sustain. Classes no longer exist. Every man holds his future in his hand, and the future of his children. In the highest positions among artists, scientists, and soldiers, men are to be found whose fathers were workmen."

M. Wallon concluded by drawing attention to a tombstone he saw in Brittany, and on which the deaths of three brothers, officers in the army, were recorded. They all were killed in the month of August 1870—one at Servigny, another at Reischoffen, and the third at Gravelotte. The father of the heroes was a humble workman.

FERNIHERST CASTLE, ROXBURGHSHIRE.

MANY will be glad to learn, says the *Glasgow Herald*, that the Marquis of Lothian has, before it is too late, given orders that steps be taken for the preservation of the baronial castle of Ferniherst, which for centuries was the abode of his ancestors. The castle, surrounded by fine old trees, stands on a commanding position on the right bank of the River Jed, about two miles above Jedburgh. It was erected in the fifteenth century by Thomas Ker, of Kersheugh, who was the eighth laird, and the first who was designated of Ferniherst; but most, if not all, of the existing buildings belong to a later date.

The tower, which is the most interesting portion, is four storeys in height, with corbie-step gable tops and bartizans at the corners. The second storey is reached by a broad stone stair, but a narrow turnpike stair leads to the others. In one of the rooms portions of the old wood panelling remained attached to the walls until the work was commenced the other week, when it was found necessary to remove it. This has been taken to Mounteviot for preservation. The greater part of the castle buildings was modernised many years ago, and serves at present as the residence of Colonel Paton. Throughout the entire building the ground storey consists of a series of dungeon-like vaults, the only exception being an apartment which seems to have been a kitchen at one time, and possesses a fireplace of great size. The tower is the only part at present undergoing repair. The front wall was almost entirely covered with ivy, but this has been taken down, and the points of the masonry have been all cleaned, previous to the walls being repointed with cement. The removal of the ivy has exposed to view three shields, which were nearly wholly covered. Two of these are over the principal doorway, and the other is over a gateway in an adjoining wall. Those over the doorway bear respectively the arms of Sir Andrew Ker, the twelfth laird, and of his spouse Dame Ann Stewart, daughter of the master of Ochiltree. The doorway is prettily decorated with shallow mouldings and with small square ornaments. Along the top is a row of a small double zigzag, forming a sort of imitation of the dog-tooth, and over this is a kind of ogee hood-mould with moulded finials. Supporting the spiral staircase there is some beautiful corbelling, which forms a fine feature between the front wall of the tower and that of the main building. The third shield bears the arms of Sir Andrew after he had been raised to the peerage as Lord Jedburgh in 1622. Sir Andrew was the son of the celebrated Sir Thomas Ker, the zealous supporter of Queen Mary, for whose cause he suffered fourteen years' banishment, besides forfeiture of his estates and honours. The plaster has been all removed from the inside of the walls, and the flooring, which was in a bad condition, has been taken up. The oak beams, however, upon which the flooring rested, being still wonderfully fresh, have been allowed to remain. During the progress of the work a Scotch copper coin and an antique spoon—apparently copper, with a thick coating of silver—have been come upon and handed over to Lord Lothian's master of works. What is known as the library—a small circular room—is well worth particular mention for its beautiful oak panelled roof, and nicely-carved central pendant. A portion of the panelling is somewhat broken, but this could be easily restored. A building standing detached from the others is in several respects a highly interesting structure, not only for its architectural features, but also because the purpose for which it was erected has never been satisfactorily ascertained. Mr. Jeffrey, in his history of Roxburghshire, calls it "the beautiful chapel"; but others hold that it must have been intended for more secular purposes. The ornamentation on this building is somewhat peculiar. The ornaments at the corners of the walls would almost suggest the horse-shoe, while all up the jambs and round the arch of the doorway there seems to be representations of eggs. There is a circular window in one of the gables. This place has for many years been used as a stable. It was probably built by Sir Andrew Ker, as a shield over the doorway bears his arms, and the initials of himself and his wife. There is a detached stone in the castle with the arms of Robert, Lord Jedburgh, the last of the Ferniherst line. A drawing of Ferniherst Castle, by Mr. Haig, appeared in *The Architect* of September 9, 1871.

RESTORATIONS IN VENICE.

SIGNOR BONI, the architect, writing to the *Times* on the restorations in Venice, says he does not participate in the optimist views expressed with regard to the restorations carried out in the past, and he believes that, in spite of the good sense of the Administration of Public Buildings, there remains much to be done before the public can admire new patches inserted into old buildings and come to look upon such repair as anything but unfortunate mutilations, even if necessary, and before the public reprobate the practice of rubbing with pumice stone marble already coloured with age.

So much for public buildings. With regard to private buildings, says Signor Boni, while we protect them from the whitewasher's brush, let us, at the same time, obtain a law to save them from the depredations of the *bric-à-brac* hunter, who does not scruple to enrich himself by spoiling his country of its lawful artistic heritage. I wish your correspondent would hold up to public reprobation those foreigners who, having the means, come to this country to tempt the cupidity of some and the poverty of others; who reduce the palaces of Venice to mere skeletons, and carry off from our dwellings their bas-reliefs and friezes. I say this in no hypercritical spirit, because we have among us many who regret the dilapidation of our city, and the remonstrances of one honest man should counterbalance the effrontery of those who work our shame and ruin.

Mr. G. Aitchison, writing on the subject, says :—Your correspondent "Beo" is hardly fair to the Society for the Protection of Ancient Buildings. Although their last request may not meet the views of every one, the Society's action generally has been of great service. I feel sure that those Italians who are most anxious for the preservation of Venetian buildings are by no means sorry to have their hands strengthened by this Society, and, if free to acknowledge it, would say that much real vandalism has been prevented by its action. It may be an open question whether it is worth while perpetuating the waves in the floor of St. Mark's; the pavement was originally flat, and has only assumed its present shape through unequal settlement; still this peculiarity has attracted the attention of natives and visitors, and has caused much wonder and some admiration.

It is most fortunate that in the case of the angel's wings there was a picture by Gentile Bellini, by which the restorer could be guided, for generally he produces—

> A plan whereby to erect
> New buildings of correctest conformation,
> And throw down old, which he calls restoration.

"Beo's" last observation, though perhaps admissible from a controversial point of view, has no analogy with the case in point, and he does not seem to understand the objections to so-

called restoration. When mouldings or carvings have perished, the so-called restoration in literature would be called forgery. If your correspondent restored the lost books of Livy, it would be as useful to the student of Roman history as the restoration of perished work to an antiquary. That whole phase of human progress and cultivation that can only be gathered from architecture and sculpture is hopelessly obscured by so-called restoration.

The perished capitals, friezes, and panels of Byzantine, Norman, or Lombard work have too frequently been replaced by artists possessed of the talent of the carvers of comic pipes and umbrella handles; but does this work give us much insight into the skill, talent, or humour of the original artists? As the philosopher has not yet arisen who will give us the mental condition of the bygone nations or people, we should carefully preserve what remains to us, and not tamper with the records.

There may be little harm in restoring that which is but slightly defaced, but when ornament or sculpture has perished, its place should be supplied by the best work the time and country afford, and in the style of the day, so as not to perplex or mislead future antiquaries or philosophers of art.

TESSERÆ.

A School of Architecture.

Sir G. G. Scott, R.A.

I AM convinced that we shall never obtain for our architectural students that artistic training which we know to be necessary unless we put our own shoulders to the wheel and provide it ourselves. I would, therefore, propose that a central School of Architectural Art shall be founded in London, in which all those branches of high art which I have enumerated as bearing upon architecture shall be taught by men of the highest ability in their several branches, these several teachers being paid so liberally as to secure both the best men and their best exertions; that this school shall be mainly self-supporting, though aided by annual subscriptions from individual architects, and perhaps by grants from the Institute of British Architects, the Architectural Association, and any other societies which may be willing to afford aid, the self-supporting element being a regulated payment by the students; for it is quite certain that the students of such an art as ours do not desire to have instruction on any terms short of its proper value, though they will be too glad to obtain, by means of a combined effort, teaching of so high a grade as would have been impossible to procure by private means; that this School of Architectural Art shall be under the management of a board of visitors, to be jointly appointed by the council of the Institute and the council of the Association (and which shall, if possible, include one eminent painter and one eminent sculptor), a certain proportion of its members retiring every year, and not being re-eligible for two years. That the teachers be elected for terms of one or two years, open to re-election, and shall be as numerous as the board of visitors deem necessary; as, for example, a teacher of drawing from the human figure, and a teacher of modelling the same (these two duties being open to be performed by the same man); a teacher of animal drawing, if the last-named cannot undertake it; a teacher of drawing and modelling architectural ornamentation; a teacher of coloured decoration, &c., the number being always dependent on circumstances and on the judgment of the visitors. There may also be occasional teachers of special subjects, such as the designing of stained glass, of mosaic, and many other branches of art, the great principle aimed at being the power and the command of funds to be attained by combination—in fact, the self-supporting element of the institution. Every architect who joins it should consider himself as bound in honour to use all his influence with his pupils to become students, and every student should be under the same obligation to give as constant attendance as possible. The instruction may be enlivened, from time to time, by lectures—not the casual papers customary at meetings of societies, but paid and practical lectures, by men of known eminence in their several departments of art. Each year there should be a competitive examination of the students, with prizes in their several departments, followed by exhibitions of the performances of the students. In fact, everything should be done to offer incentives to the most strenuous exertion, and to inspire the students with an ardent enthusiasm for self-culture, and for using every possible endeavour to attain eminence in the noble art which they profess.

Subordination in Gothic Arching.

Edmund Sharpe.

The arch, as handed down by the Romans to our forefathers, exhibited one broad uniform soffit, extending throughout the whole thickness of the wall, panelled and relieved on its surface and sides with superficial mouldings, but unbroken and undivided in the principle of its construction. It appears to be extremely probable that this simple form of construction prevailed throughout the first thousand years of the Christian era; and, so far as we are able to form an opinion from the few remains which are left in buildings belonging to the Saxon period, it appears almost certain that all the arches of that period were of the same form. In the Norman period, however, a new principle was introduced, which was rapidly adopted and soon became universal, and was never subsequently abandoned. According to this plan, the arch was divided into two or more layers or orders, which formed, in fact, a series of concentric receding arches, of which the innermost or lowest carried on its back the one above it, which was in turn subordinate to the next, and so on. This new principle, then, was that of subordination, one which was not indeed confined to the member of which we are treating, but which rapidly overspread the whole of the building, and the influence of which became eventually perceptible in its minutest detail. We now approach the subject from a new point of view. A Mediæval arch was composed of a series of consecutive and concentric courses or orders, and each order carried a series of mouldings on its outer edge. We have now a key to the classification and arrangement of these mouldings; and, instead of viewing or representing them any longer as one continuous, undivided series, we must look upon them as the ornamental portions of a series of distinct subordinate arches, grouped and combined in a highly-artistic manner, so as to produce an appearance in which the due subordination of parts, so uniformly characteristic of the designs of their periods, is made consistent with the general unity of effect essential to the importance of so principal a member of an ecclesiastical building.

Characteristics of Good Timber.

Professor Rankine.

There are certain appearances which are characteristic of strong and durable timber, to what class soever it belongs. 1. In the same species of timber, that specimen will, in general, be the strongest and the most durable which has grown the slowest, as shown by the narrowness of the annual rings. 2. The cellular tissue, as seen in the medullary rays (when visible) should be hard and compact. 3. The vascular or fibrous tissue should adhere firmly together, and should show no wooliness at a freshly-cut surface, nor should it clog the teeth of the saw with loose fibres. 4. If the wood is coloured, darkness of colour is in general a sign of strength and durability. 5. The freshly-cut surface of the wood should be firm and shining, and should have somewhat of a translucent appearance. A dull, chalky appearance is a sign of bad timber. 6. In wood of a given species, the heaviest specimens are in general the stronger and the more lasting. 7. Amongst resinous woods, those which have least resin in their pores, and amongst non-resinous woods, those which have least sap or gum in them, are in general the strongest and most lasting. 8. It is stated by some authors that in fir wood that which has most sap wood, and in hard wood that which has the least, is the most durable; but the universality of this law is doubtful. Timber should be free from such blemishes as clefts or cracks, radiating from the centre, "cup shakes" or cracks which partially separate one annual layer from another; "upsets" where the fibres have been crippled by compression; "rind-galls" or wounds in a layer of the wood, which have been covered and concealed by the growth of subsequent layers over them, and hollows or spongy places, in the centre or elsewhere, indicating the commencement of decay.

Fallacies about Superiority of Roman Building.

D. Arago.

It has been said "Some of the Roman buildings have lasted eighteen centuries. A great number of modern buildings are in a deplorable condition!" This comparison is essentially erroneous. To give it any value we must draw a parallel between none but the greatest monuments of the two epochs. The results will then be very different to those on which the learned support their position. The ramparts of the Bastille were of extreme solidity even in the centre of the masonry. It was necessary to use gunpowder to destroy them. Gunpowder was also found necessary to destroy at Agen the ruins of a bridge built about the year 1200. M. Vicat ascertained that the mortar of the bridge of Valentré, built at Cahors in 1400, surpassed in hardness that of the ancient theatre, of which the ruins are seen in that town. Ancient architects, like modern, built according to the nature of the materials at their disposal, and also according to financial exigencies, either edifices which were indestructible, or with the same exterior forms, temples, palaces, and houses, without solidity. The constructions of the latter class rapidly disappeared. The others alone have resisted the ravages of time and the violence of the seasons. The blind admirers of bygone ages, have they forgotten the words of Pliny, "The cause from which at Rome so many buildings fall is the bad quality of the cement"? If, as it is pretended, the Romans knew certain methods of preparing good mortar,

we ought to find this substance in all their public monuments with qualities almost identical. Now this is not even the case in comparing different parts of the same edifice. Experiments made with mortar taken from different points of the bridge of Gard, gave resistances varying in the proportion of one to three. Those who devote themselves to these comparisons should remember that time acts unceasingly in foundations on the hardness of mortar. The mode of action by which this conglomerate hardens—acquires adhesiveness—is still a matter of controversy among the learned. But no one can deny that there are circumstances under which it is impossible for this mysterious action to continue for a long series of ages. It would seem forgotten, that in considering the knowledge of cements in the art of building, we are not reduced to simple conjectures. Vitruvius, contemporary and architect of Augustus, has left a detailed account of the precepts in use among the builders of Greece and Rome. These precepts are far from justifying our unreserved admiration of the ancients. The ancients were not in possession of any exact notion concerning the chemical modification that calcareous stone undergoes in the kiln, a modification by which its friability is so much increased. Neither did they know anything of the kind of action which restores to the disintegrated molecules of this stone converted into lime the adhesion and hardness of which they had been deprived by heat. The efforts of Vitruvius to give a plausible explanation were ineffectual. The same was the case until the chemical discoveries of Black respecting carbonic acid, with the attempts of the most illustrious successors of Vitruvius, Scamozzi, Philibert Delorme, Perrault, &c. One single word will disabuse all those who persuade themselves that the theoretic errors of these great architects are of no consequence. Take the instance of Philibert Delorme. To arrive at a maximum of solidity in edifices, he thought it necessary that the lime should be taken from the same bed of limestone as the materials of the masonry. This direction, if it had been followed out, would have involved an enormous increase of expense.

Robert Hooke, Surveyor.

JAMES ELMES.

Robert Hooke was the assistant, and sometimes the rival, of Wren during the greater part of that architect's career. He, like Wren, was an experimental philosopher; like him, had received a doctorial degree, when that honour was conferred only upon men of first-rate talent. To use a theatrical phrase, Hooke may be considered as Wren's double, and took the part of his principal whenever called upon. The great and extensive charge which devolved upon Wren after the fire of London induced him to take to his assistance this ingenious and able associate, whose avocations, under Wren, were chiefly those of measuring, adjusting, and setting out the ground of the houses in the private streets to the several proprietors, while he reserved the higher and more important works of designing and superintending the execution of the public works to himself. Hooke, at the same time, divided the labours and honours of the Royal Society with Boyle, Moray, Wren, and other philosophical members. Among the subjects submitted by Hooke to the Royal Society were a new method of making bricks, with less charge and more speed than had been then practised, and a design for a collegiate building for the use of the Society, to be built on a site of ground presented to them by their munificent associate, Mr. Howard, of Norfolk. This volunteer design did not please the Society, nor did the manner in which Hooke appeared to trench upon his master's ground, for at a meeting of the council on May 4, 1668, the president (Lord Brouncker) moved that the building of the Society's college might be begun forthwith, and Dr. Wilkins was desired to procure, at the next meeting of the council, Dr. Wren's design for the building. This was done, and Hooke was ordered to get a model made of the approved design, to contract with proper persons for the execution of the work, as also to find some one to be constantly present, and to see the workmen do their duty: thus appointing Wren as architect, Hooke as surveyor and valuer, with a resident clerk of the works. Of Hooke's repeated invasions into his master's province, abundant proofs are found in the records of the Society, and Wren at last complained of these interferences. Few men had more reason to say *sic vos non vobis* than Wren. Hooke appears throughout to have followed, thrust, and attempted to supersede in the public estimation his friend, patron, and principal, in every thought, invention, and discovery. Among the most prominent of the attempts is that recorded in the Transactions of the Royal Society, of his submitting to the council on September 19, 1666, a model for rebuilding the city, with which the Society is said to have been well pleased. Dr. Waller, in his life of Hooke, affects to wonder why this model was not accepted. The reason was, that the superior and more digested plan of Wren, to say nothing of Evelyn's, had been previously before the King and council. Hooke is believed to have been the architect to the Duke of Montague's house in Bloomsbury, afterwards the British Museum. Of his authenticated works, the best are the Royal Hospital of Bethlehem, which formerly stood on the site now occupied by Finsbury Circus, Moorfields, and Aske's Hospital at Hoxton. The former of these buildings had a Frenchified palatial look, not in accordance with its destination—a hospital for lunatics; and the latter, a collegiate appearance, with colonnaded ambulatories for the aged inmates, a hall and chapel for their accommodation, and a school for the education of orphan boys of the company, with a handsome statue of its founder in the centre. The style of both these buildings may be seen in the various illustrated histories of London, and a large perspective drawing of Aske's Hospital, by the architect, was among the pictures that decorated the court-room of the Haberdashers' Company, who are the trustees and governors of the hospital. This building has also been pulled down.

Building Workmen as Firemen.

J. BRAIDWOOD.

In forming the brigade in Edinburgh, where the firemen are only occasionally employed, the description of men from which I made a selection were slaters, house carpenters, masons, plumbers, and smiths. Slaters make good firemen, not so much from their superiority in climbing, going along roofs, &c., although these are great advantages, but from their being in general possessed of a handiness and readiness which I have not been able to discover in the same degree amongst other classes of workmen. It is, perhaps, not necessary that I should account for this, but it appears to me to arise from their being more dependent on their wits, and more frequently put to their shifts in the execution of their ordinary avocations. House carpenters and masons, being well acquainted with the construction of buildings, and understanding readily from whence danger is to be apprehended, can judge with tolerable accuracy, from the appearance of a house, where the stair is situated, and how the house is divided inside. Plumbers are also well accustomed to climbing and going along the roofs of houses; they are useful in working fire-cocks, covering the gratings of drains with lead, and generally in the management of water. Smiths and plumbers can also better endure heat and smoke than most other workmen. Men selected from these five trades are also more robust in body, and better able to endure the extremes of heat, cold, wet, and fatigue to which firemen are so frequently exposed than men engaged in more sedentary employment.

The Sketch-Book in the Lille Museum.*

PROFESSOR DONALDSON.

Who was the real author of these sketches? My own impression is that the whole book may be attributed to Vasari himself—that all the sketches of the library, of the Cupolino of the Sepulchral Chapel, and of the other details of Michel Angelo's work, were taken for his own guidance, or for the purpose of sending off copies to the master, to enable him to give the proper instructions to direct Vasari's proceedings in the completion of the buildings confided to his care. The sketches generally are executed with a certain ready freedom of hand and no great care; but some are drawn with much delicacy and with considerable precision and minuteness of form. Hardly more than two or three evince that bold and vigorous freedom of treatment which we are accustomed to consider as characteristic of the Maestro, as Vasari repeatedly calls him. One circumstance particularly struck me, and that was the numerous sketches of the circular chapel built in the cloister court of St. Pietro a Montorio, by Bramante. This building excited vast admiration at the time, and Serlio himself gives the plans, elevations, and sections of it in his work next to those of the cupola of St. Peter's, and among the numerous illustrations of ancient buildings, and Palladio also gives it among his ancient edifices. Other writers of the time mention it with unqualified praise. It would therefore be no wonder if Vasari, who was employed upon designs and models for tombs at St. Pietro a Montorio by order of Julius III., should have sketched parts and kept a record of such details. But that Michel Angelo, who despised the trammels of ancient art, should condescend to the task of minutely drawing the work of a cotemporary, and that cotemporary no friend of his, but the uncle and supporter of his rival Raphael, and one who crossed him in his great work for the tomb of Julius, seems beyond probability, however noble were many impulses of Michel Angelo's generous nature. I am given to understand that many French artists who have visited the Wicar collection concur in my opinion as to the propriety of not attributing this collection of sketches to Michel Angelo; and a distinguished member of the French Institute, a great amateur and connoisseur, assures my friend Hittorff that he had traced the writing on some of these drawings, and that it did not at all accord with that of the great master. I am therefore confirmed in the conviction that these architectural sketches are not the production of Michel Angelo.

* Vide *The Architect*, July 16, 1886, p. 33.

NOTES AND COMMENTS.

The fate of Mr. Nathan C. Hughes must make painters fear when their friends invent names for them. This unfortunate gentleman was styled "the swiftest painter of the age." Patrons in consequence were shy of him. All his commissions amounted to about twelve original pictures and twenty copies. He is now an inmate of the Lambeth Workhouse; but as a few orders came to him owing to the mention of his case in the papers he may soon be at liberty. We are not acquainted with the painter's works, but the description he gives of his method is not suggestive of a charlatan. "I paint from the shoulder," he says, "and never use a rest-stick. After each touch I walk backwards to see the effect a few yards. I then stand still a few seconds, or minutes, and consider what touch to give next. I then walk forward and give the touch with great care and deliberation as to its exact location, form, and colour. I then walk back and consider as before constantly. I always stand still before the canvas to give the touch slowly and accurately. I average about one touch per forty seconds; sometimes I give two or three touches before I walk back. I use flat hogshair brushes, and a palette and colours the same as other artists; and first I only locate and then I draw my objects on the canvas with charcoal carefully, so that they never require moving or altering afterwards. To paint a lady's eye with the proper expression from the shoulder requires a steady hand and nerves, and those I have. The simple secret of the swiftness lies in the slowness and care of my touches, which seldom require correction. To judge from my movements alone, you would think I was 'the slowest painter of the age.'" Mr. Hughes is evidently an artist with precision of style.

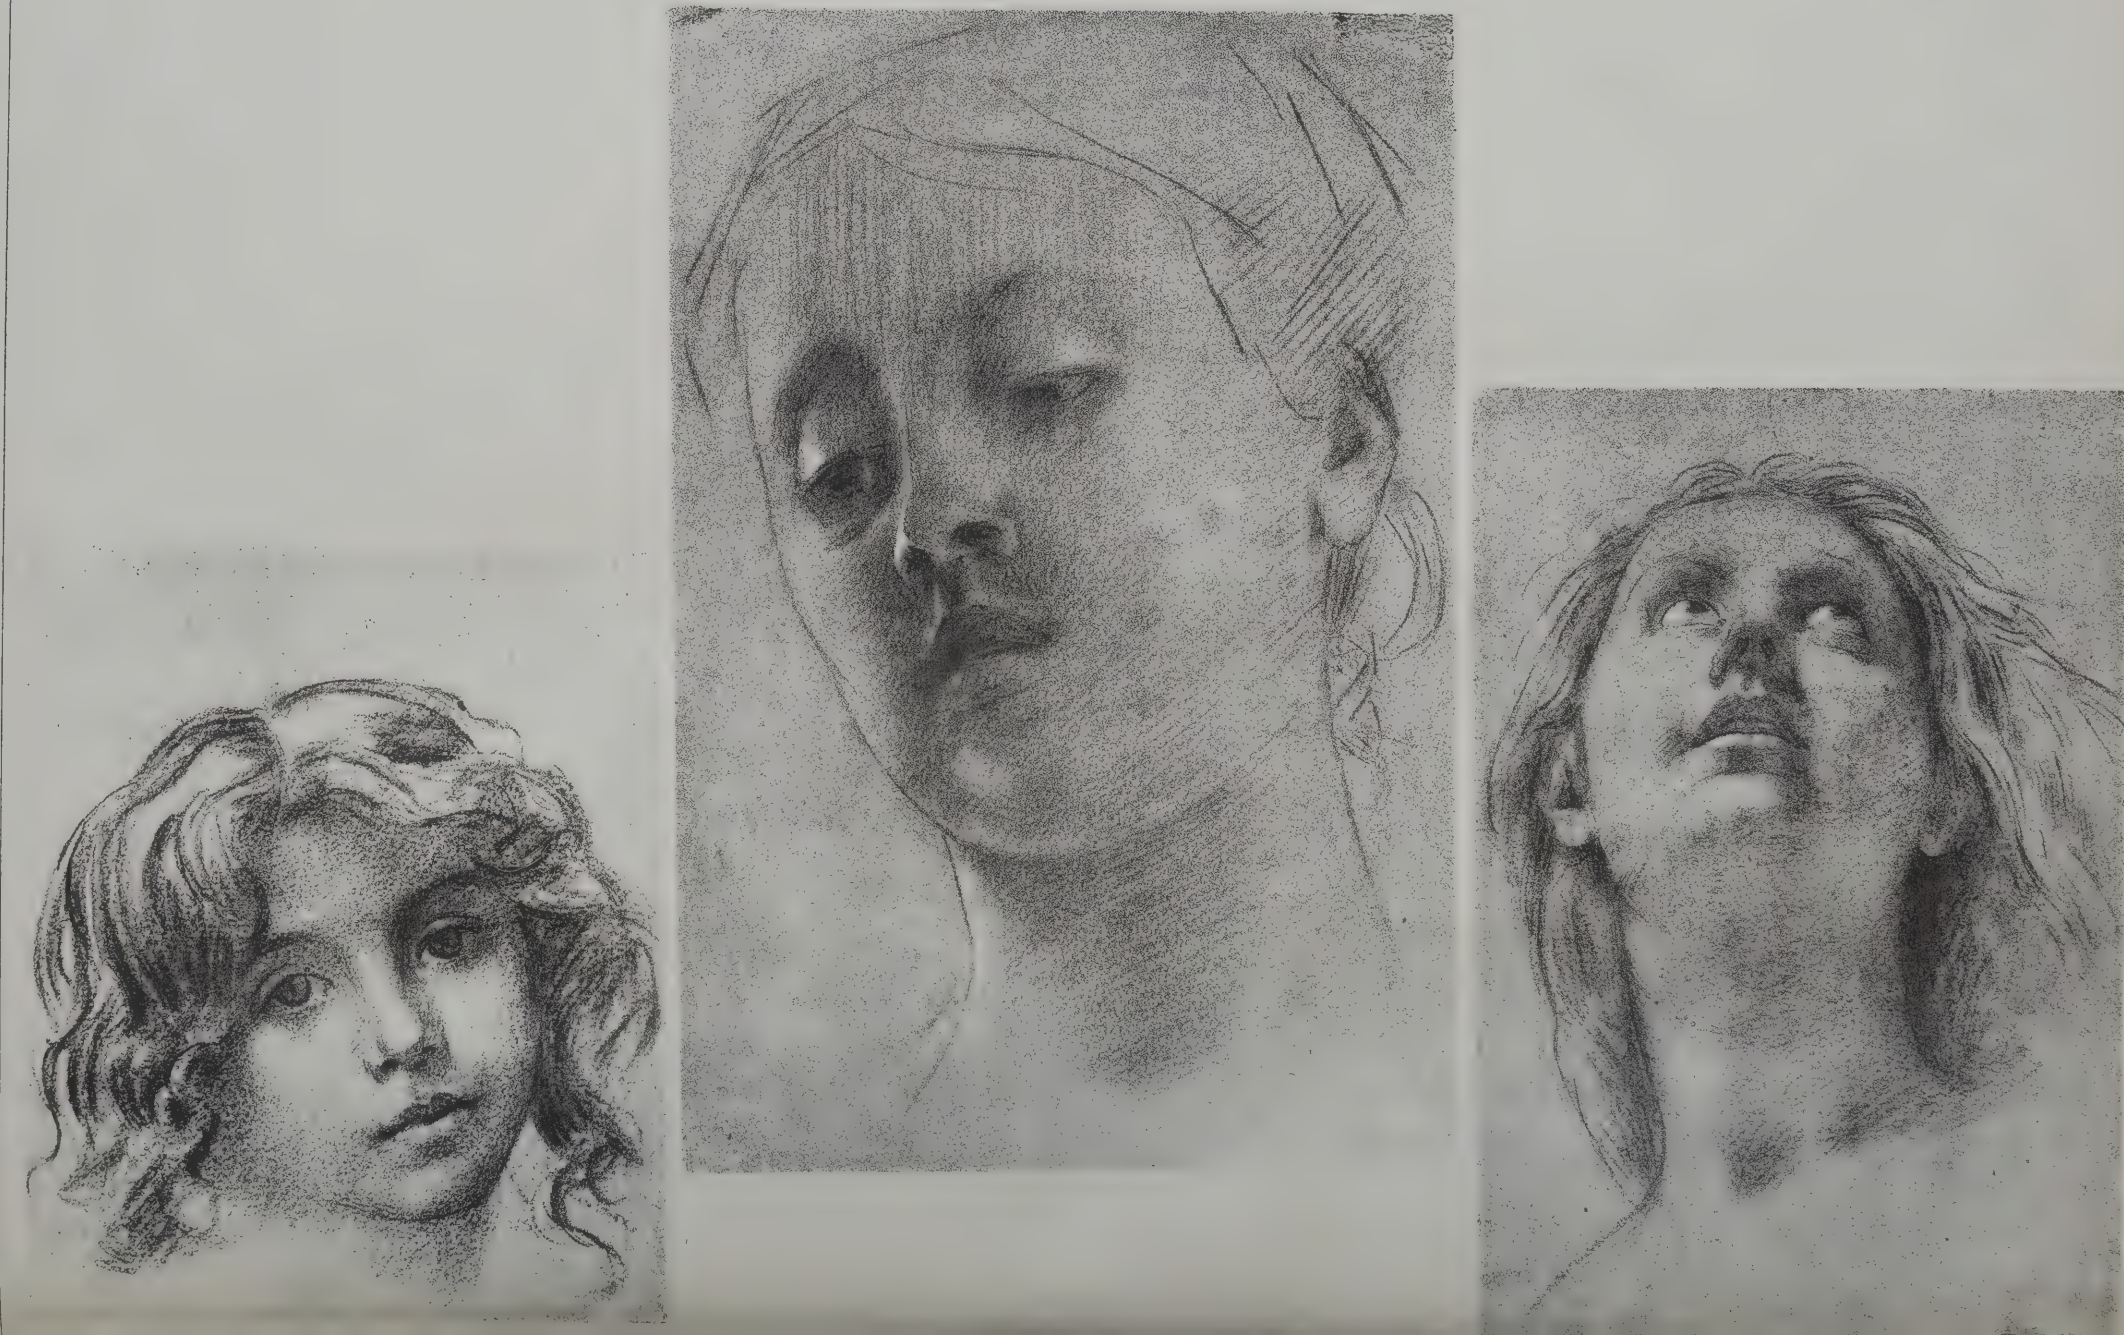
It is not generally known that the Louvre possesses sculptured stones which formed a part of the Parthenon. They are not of great importance if compared with the marbles in the British Museum. However, from their origin, interest belongs to them, and the eight or nine fragments are to be placed in the new Salle de Phidias.

Anything that is said by M. Jules Simon on the subject of education is sure to receive serious attention in France. When in the preface to his last book he is found denouncing the expenditure of so much money on school buildings while the teachers are badly paid, his argument does not augur well for architects. Apparently the sum voted for education will not be enlarged. It is not prudent that the services of masters of schools should be gauged by a lower standard than prevails in other branches of the public service, for they may not serve the cause of the Republic with the young generation; but it can also be said that the schools lately erected in Paris and the provinces are not of a grandiose or over-expensive kind. The cost per head is less than the average in England.

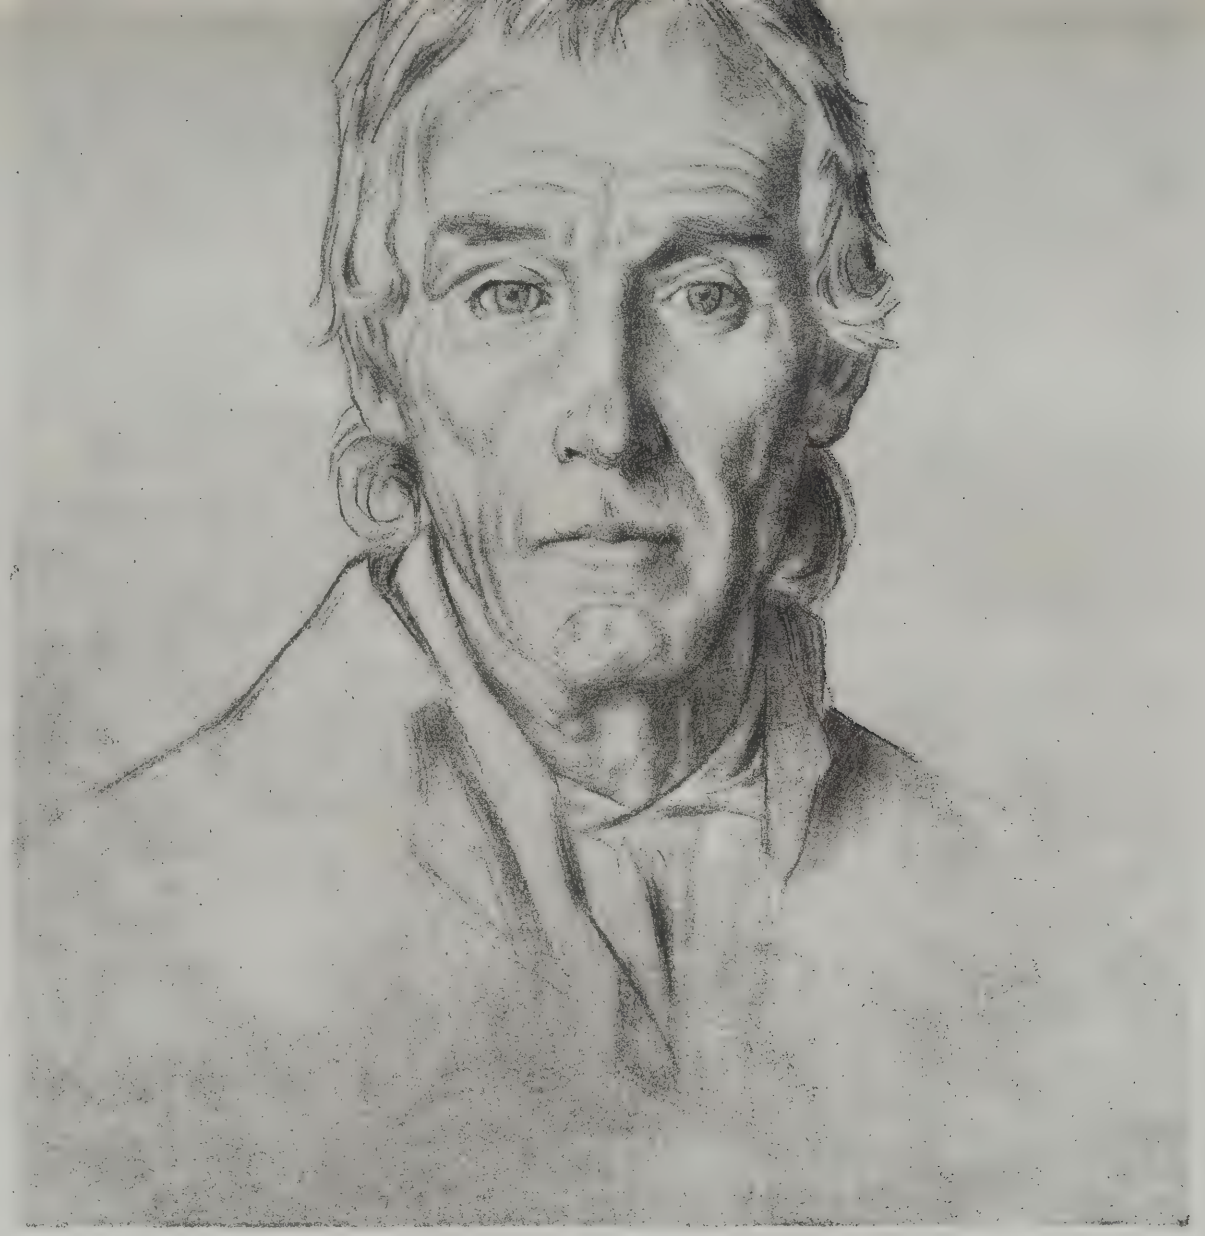
The replies which have been addressed to the Foreign Office on the subject of employers' liability abroad are interesting. It is remarkable that in America, where labour is said to be powerful, there are no statutory provisions imposing liability on employers in any of the States of the Union except Iowa. The common law doctrine in the United States is that common employment relieves the employer from responsibility for the injuries which one employé may receive through the negligence of a co-employé, unless negligence can be shown in the employment of unfit agents. This doctrine is the law of the United States, the single exception being in Iowa, in which the statute law provides "that every railway company shall be liable for all damages sustained by any person, including employés of the company, in consequence of any neglect of its agents, or by any mismanagement of its engineers or other employés of the company." But this law applies only to railways, the common law applying in all other cases. Parties seeking work in factories or on railroads can make a special contract relative to damages in case of accident through the negligence of co-employés, but this privilege throws the burden on the shoulders of the workman. The employer is now liable, under the common law, for two classes of injuries caused by fellow-workmen: when he has directly interfered in the act which caused the injury, and when by his negligence in selecting he has employed an incompetent workman. In all other cases, except where special legislative restriction exists, he is not liable for injuries to co-workmen unless by special contract he assumes to become liable. It is now, however, sought to change the "status" of the parties by legislative action, and to make the employer also liable for all injuries caused by his authorised agents in the legitimate performance of the duties which he has prescribed, such regulation to apply to industrial works and railroads. Such a law would place the necessity of proposing a special contract upon the employers instead of upon the workmen seeking employment.

The administrative council of the Paris exhibition of 1889 have estimated the expenses at 45,000,000 of francs. M. Lockroy, the Minister, has cut off eight millions at one swoop. The cost may therefore be estimated at one and a half million pounds of English money. The works are put down at thirty millions; the remainder is for administration and contingencies. The credit was originally for forty-two millions; two millions will be applied for reproductions of Old Paris, and the remaining three millions will be afterwards utilised.

German literature is not much studied in France, and there are fewer translations of the great authors to be found in that country than in England. The speculations of Semper have a chance of being made known there—or at least among French architects—for Mr. Harvey has commenced a series of articles on that philosopher in the architectural review which is edited by M. César Daly. It is the more remarkable to find articles of the kind in such a publication, for some of M. Daly's essays in bygone years bore a resemblance to Semper's.



There has been commotion among the artists of Ghent in respect of the Prix de Rome—a reward which Belgium possesses as well as France. The prize for painting was obtained by a M. Montald, and he and his friends made merry over his victory. But there was consternation when, after the feast, it was discovered that the Government had annulled the decision of the jury. It is needless to say the brave Belgians almost rose in revolt. Afterwards it was discovered that the election was not recognised because of non-compliance with the conditions of the prize. The law prescribes an absolute majority. Of the nine judges two would not vote, three were against M. Montald, and four were favourable to him. A new election took place, and, as the two recalcitrants no longer stood aloof, six votes were then obtained by the artist, and no doubt the prize has become more enjoyable through the temporary disappointment. All the authorities desired was a compliance with official forms.



"Hamlet" at the Théâtre Français is less of a success than we had anticipated when writing on the subject a few weeks back. Many of the defects which we had hoped might be avoided are almost obtrusively perceptible. For example, we ventured to suggest that M. Got should remember the position of Polonius. He was a gentleman, but he is not so represented in the house of Molière, M. Maubant apparently is fixed in French classic mannerisms, and cannot adapt himself to so foreign a *rôle* as a ghost. M. Silvain is disappointing, for there is nothing about his manner that would be likely to captivate a queen. In one or two of the earlier scenes Mdlle. Reichemberg played well—as she does whenever she has to be demure—but the mad scene was beyond her powers. It is difficult at present to criticise M. Mounet Sully. He was evidently not at ease on Tuesday, but he has taken a very lofty conception of Hamlet's character. He suggests that when the Prince spoke of being carried away by whirlwinds of passion, he was remembering his own impulsiveness. M. Mounet Sully's last scene was magnificent. The tragedy is mounted in an expensive way, although more archæological accuracy has been witnessed in London theatres. As a scenic display it was novel; and since M. Meurice's version is far more impressive than the one lately performed at the Porte St.-Martin we may expect the tragedy to be a great success, according to managerial ideas.

STUDIES FROM LIFE.

M. URBAIN BOURGEOIS holds a prominent place among the decorative painters of Paris, and his works are in much request for churches in many parts of the world. At the present time he has several important commissions on hand for Canada ; the French Canadians are never forgetful of their relations to France. We publish this week some sketches from M. BOURGEOIS's portfolio of life studies. The head of the old man might be supposed to belong to a philosopher, but a French peasant sat for the portrait.

ARCHITECTURAL ILLUSTRATION SOCIETY.

THE ARCHITECTURAL ASSOCIATION.

WE understand that the Architectural Association's practical class of masonry, under the direction of Mr. Lawrence Harvey, will be carried out on the same lines as the classes of masonry in the old guilds of stonemasons. The students will be made to construct models of various structures at the scale of about one-eighth real size, and will execute for that purpose the working drawings, as well as cut out each stone. The instruction will be mutual, as is still usual in the remaining guilds of stonemasons abroad. Every student will be expected to give as well as to receive instruction, so that the lessons delivered to a few by the director of the class may be transmitted to all those who wish to study masonry. By this means two advantages are secured : firstly, a much closer supervision can be given to each student than when the teacher has to deal with large numbers of pupils ; secondly, each student has an opportunity of testing his own knowledge when he endeavours to teach others. Therefore none of those who apply to join this class need fear to be disappointed. The selection of the ten members of the first class will be made on the principle of their seniority in architectural practice, as being the most likely to profit by the instruction given, and to be able to teach in their turn. The others will join the subsidiary classes, which will be formed as soon as possible under the direction of the members of the first class.

We advise architectural students to utilise this opportunity of studying the science of masonry, a science indispensable to the true comprehension of the art of architecture ; for, as Mr. Dobson truly says in his rudimentary treatise on masonry, "The character of all genuine architecture, no matter of what age or country, is so dependent on its mechanical structure, that we cannot successfully imitate the style of any period, without thoroughly understanding the principles of construction which prevailed at that time."

THE ORIGINS OF ORNAMENTAL ART.

ON Sunday a lecture was given at the New Islington Hall, Ancoats, Manchester, by Mr. William Morris, on "The Origins of Ornamental Art."

Mr. Morris began by explaining what is meant by ornamental art. It is, he said, the art of the people—the art produced by the daily labour of all kinds of men for the daily use of all kinds of men. All the things produced by human labour might be made without any reference to anything but their first obvious use. But men would not have it so. From the very first they have striven to make their household and personal goods beautiful as well as useful. The rudest savage no sooner learns how to make anything than he learns also how to ornament it. Before the earliest dawn of history this instinct for ornament existed as clearly as it did in the palmy days of Italian art. As you know, implements exist of men who dwelt in Europe ages before any of the races we name now on which are carved with no little skill the forms of the beasts of the forests they wandered in, and in which life must have been so hard and beset with so many dangers that we may well wonder that they had time or courage to think about art. So divine a thing is the spark of human intelligence ! What does all this mean ? Why did they do it and take all this trouble ? Who taught them ? Indeed their teacher is not far to seek. Whatever lived or grew about them—nay, the mountains, the rocks themselves—"the bones of the earth," as the Northmen called them—had something about them which they must have dimly known for beauty. The things which were useful to them for food and fuel and clothes were ornamented ; the day and the night, sunrise and sunset, which showed to their dim minds as beings of passions like themselves ; the serpent whose lurking malice and swift wrath they feared, and whom they worshipped lest he should slay them—all these had been fashioned fair and lovely by forces of which they knew nothing, and they, the latest born and may be the most terrible force of nature, how could they choose but take up the links of the chain and work as nature worked about them ? Many things she compelled them to, and this also. This, then, was the birth of popular or ornamental art, the birth of man's intelligence. It seems to me that ornament on wares had its origin not merely in an attempt to escape from the wearisomeness of labour, but rather in an expression of pleasure in the hope and sense of power and usefulness which men felt in the making of things in the childhood of the world. That pleasure of labour did not fail man for many ages. That which makes Gothic art—by which term is indicated the work of the Middle Ages—what it is is its freedom. It was above all things the art of the people—the art of co-operation. No craftsman who is a real one is despised in it. There is room for every mind and every hand that belongs to a real man ; something to express, and some means of expressing it are all that is asked for. All the time this art lasts no handicraft lacks beauty for a moment, nor is any one set to dull and slavish toil. Things grow beautiful under the workman's hands without effort, it would seem, and men do not know how to make an ugly thing. Nowadays when we light on a piece of the household goods of this period we pay vast sums of money for it and treasure it up in a museum, for it teaches us—us who know everything else—this rough piece of handiwork, done by an artisan who thought that the world was like a flat dish and that the sun went round the rim of it. If this seems strange to you, let me remind you of one kind of work wrought by these craftsmen which is both more accessible and more impressive than their movable household goods. I mean some of the buildings which our forefathers lived in, and among which it is your rare good fortune to live—a good fortune which I hope will leave its impress in many an hour of sweet indestructible pleasure on the future lives of every one of you. I am afraid I am taking you a long way from the first dawn of popular art. Centuries we cannot count lie between the day when the cave dweller scratched his drawing of a mammoth on a mammoth's bone, and the day when the English masons and wood-carvers struck the last stroke before the Reformation on the work at, say, St. George's Chapel, Windsor. During all those ages whenever we catch a glimpse of the life of the people we find the popular arts progressive on the whole, and seldom failing in their first aim of lightening the toil of man by giving him pleasure in his daily work. A long lapse of years indeed, while from the time when Sir Thomas More wrote his eloquent attack on commercialism and land-grabbing till now, the days are few, the time short. But what has happened to popular art in that short while ? What has happened to the popular arts, I say, in those three hundred years of struggle, mostly successful, for religious and political liberty ; in those centuries of miraculous progress, during which England has grown from a semi-barbarous island-kingdom into a mighty empire, the master of the minds of men as well as of their bodies ? I can tell you in three words what has happened to those arts : they have disappeared. That is a strange story indeed, and you may well doubt its truth, the change is so tremendous. But my whole position is this—to have popular art, or the art of the people, it must be made by and for the people, which means, as I have said, that man's handiwork is universally beautiful to the eye and elevating to the mind. But such art as pretends to be popular nowadays, do the hands and minds of the people fashion it ? Do the people use it ? Are the people rejoiced with the making and the using of it ? So far is this from being the case that the people do not even know that such an art exists or ever has existed. What pretence there is of decorative art is little touched by the people's hands and not at all by their minds. They work at it not knowing what they do. Like all other toilers nowadays, their work is a grievous burden to them which they would cast off if they could. We cannot help knowing that not another hour's work would be done on the decorative arts to-day if it were not that the workers feared death by starvation if they left their work. I hope you do not suppose that on these terms of labour you can have an art which has any life in it. If you do you are dreaming, and will have rude awakening some day. The existing gulf between rich and poor, which is in fact a gulf between civilised and uncivilised people living in the same State and under laws nominally the same—this is the gulf which has swallowed up the popular arts ; the art which raised our ancient buildings here and elsewhere, and under which every man's intelligence, were it great or small, was used and subordinated at once for the creation of a great work of art, whereas now it is

accepted as a fact that whatever intelligence one of the non-gentleman class may possess is not, and cannot be, exercised during his working hours. In order to win that privilege he must raise himself out of his own class and become a gentleman. The essence or soul of popular art is the due and worthy delight of each worker in his own handiwork—a delight which he feels he can communicate to other people, as it has been communicated to him by the thoughts of many generations of men under the name of tradition. If any of you care about art in any form, I am sure you will allow that this reciprocal pleasure of communication is always present at the birth of a work of art. When you have been listening, for instance, to a beautiful piece of music, could you possibly suppose that it was an irksome task to invent the sounds which were filling your whole soul with satisfaction, or, when you have been reading some beautiful passage of poetry, could you suppose that the strong and melodious words which were elevating your soul and opening new worlds to you had been given forth from the writer's brain in a dull and pleasureless mood? Surely it is impossible that it should be so. Yet, remember, the artist's, the musician's, the poet's work is not easy; it is real labour enough unless he is a pretender. There are traps and pitfalls on the right hand and on the left into which his hope of creating a work of art may fall, and against which even the best man has to be laboriously on his guard. I say he is a workman or no artist, and on those grounds I claim some share of the divine pleasure of creation which accompanies it for all handicraftsmen, believing firmly that the making good of this claim is a necessity for the world, if civilisation is to be anything else than a name. For, first, unless this claim is allowed and acted on, unless it is insisted on as a necessary part of the organisation of society, it must be the rule that all things made by man for the use of his daily life will be ugly and base, will show wherever they are placed as mere blots on the beautiful face of the world. And, secondly, it will surely be but right and just that they should be ugly and base, for so done they will be but tokens of the enduring sorrow and slavery of the great mass of mankind; for all people not dishonest must work, and in one way or other their working hours must be the most important part of their lives. If, therefore, they have due hope, pleasure, and honour in their daily work, their lives will, on the whole, be happy; if they lack that hope, pleasure, and honour, their lives will be unhappy. It would, therefore, be unjust that art should come from the unhappy lives of the most of men, or, in other words, that the great mass of people should toil miserably for the pleasure of a few dishonest people. Fortunately, you see, as far as the arts go, that cannot be; it is a question of art and the happiness of the worker, or lack of art and his unhappiness. For these days, then, in which man has obtained so much domination over the forces of nature, in which so much of what passes for wealth is produced, in which society, taken as a whole, either is or could be so rich—in these days what are the conditions of life for the working classes—that is to say, for most men—which would produce beauty and happiness for the world? 1. No honest or industrious man must be under fear of poverty. The sordid troubles which this fear produces destroy imagination and intelligence, or turn them into other channels than the hope of giving pleasure to the world. Every man, therefore, must be certain of earning a due livelihood, by which word I understand all things necessary for his mind as well as his body. 2. All men must have due leisure—rest for body and mind, time for following according to their bent other occupations than the mere breadwinning one, even if it be pleasant; and if their breadwinning work is of such a rough nature as of necessity to lack art or expression of pleasure in it, the daily hours of such labour must be very short. 3. It follows from this last remark that all work in which art or pleasure is impossible should be done without as far as may be—that it should be looked on as a nuisance to be abated, a sickness of society. As far as possible it should be done by machines; and machines should never be used for doing work in which men can take pleasure; whereas at present, as we all know too well, men do the work of machines and machines of men—both disastrously. 4. Those who are to produce beauty must live amidst beauty; their homes and surroundings must be clean, orderly, and, in a word, beautiful. This should be no hard matter to accomplish, since the whole world is beautiful save where man has made it ugly. 5. All men should be educated, and have their due share in the stored-up knowledge of the world, so vastly greater now than in the days of art, but so much more unequally shared. All men, I say, should be educated, not down to their "station in life," as people call it—that is, according to the amount of money their parents may have—but according to their capacity. 6. When all these claims are allowed and acted on, the last claim I make for labour will come of itself—that is, that there should be an end of class distinctions; that is to say, that all crafts should be honourable and honoured, and that every man should be able to rise to eminence and fame by the exercise of his own craft, the work he understands best; whereas at present he can only rise to eminence by deserting his craft, by taking an undue share of the wealth of the world as wages for doing lighter work than his fellows—by becoming a capitalist, as the phrase goes. To my mind these are the conditions of life for working men, or really for all men, under which we can have in these days once more popular art or a happy life for most men. Is it worth while to strive to bring about this happy life? If it be, can we say that the price to be paid for it can be too high, whatever it may be? You will have understood, if you have followed my statement of the due conditions of labour, that in my belief that price is the reconstruction of society, for no mere palliatives of the evils of the present system will bring about those conditions. Furthermore, I admit that such a great change would involve the sacrifice from many of us of things now much cherished; yet, as I believe that those who uphold the present conditions of labour on the grounds of self-interest do so rather from stupidity than malice, so I think that their loss, or punishment if you will, will be rather imaginary than real when the change comes. I think what we shall chiefly have to sacrifice will be the incumbrances, the troubles, the sorrows even, which we now cherish as part of our wealth. As to the means by which the reconstruction is to be brought about, I must for more than one reason say nothing of them to-day save this, that you yourselves in one way or other will, as time goes on, have offered to you opportunities of helping forward or of hindering that reconstruction. I believe the time is at hand when each one of us of the well-to-do and rich classes will have to choose whether he will strive to have the great mass of men his equals and friends or to keep them down as his slaves. When that time comes may we all remember this, that wretched and shameful as is the condition of a slave, there is one condition more wretched and shameful still—that of slaveholder.

THE SHREWSBURY BATTLEFIELD.

THE members of the North Staffordshire Field Club took part in an excursion to Battlefield and Haughmond Abbey on Thursday in last week. Mr. Charles Lynam, architect, who was the leader of the party, read a paper on the battle of Shrewsbury on the site where, it is said, the slain were buried. Mr. Lynam said:—Henry IV., having usurped the throne of his cousin Richard, and having put that unfortunate monarch secretly to death, naturally had many enemies. Some of these were great barons of ambitious mind, who, seeing the success of an adventurer, thought to follow his example. Others, like Owen Glendower, friends of the late king, wished to avenge his death, and put upon the throne the rightful heir, the Earl of March. Others again, like the Percys, having been chiefly instrumental in putting Henry on the throne, did not consider that they had been sufficiently recompensed for their great services. Therefore the Percys, father and son, Owen Glendower, Thomas Percy, Earl of Worcester, many knights of Chester and the Marches, made a rendezvous at Shrewsbury, meaning thence to march in overwhelming force against the king. However, Henry, ever active and prudent, was equal to the emergency. From Burton-on-Trent he marched straight to Shrewsbury, and prevented the junction of the Welsh under Glendower, who were at Oswestry, 12,000 strong, with the insurgent army from the north. Arriving in time to prevent Harry Percy from scaling the walls, he did his best to force on a battle at once. An attempt made by Percy to come to terms was frustrated by the treachery of Thomas of Worcester, who perverted the friendly answer of the king, and made it an insulting command to submit. The fiery Hotspur replied with a challenge to Prince Henry to settle the matter by duel, which the king forbade, and on the vigil of St. Mary Magdalene, July 22, 1403, the armies met; the battle was one of the bloodiest and fiercest in our history, the forces were equal—12,000 on each side. The leaders were well matched. Henry exposed his person in the thickest of the fight; his gallant son, whose military achievements were afterwards so renowned, and who here performed his novitiate in arms by his valour, regained his father's lost opinion, and, even when wounded by an arrow in the face, refused to quit the field. Harry Percy supported the fame for fiery valour which in many a bloody fight had won him the name of Hotspur, and Douglas, his ancient enemy, and now his friend, still appeared his rival, amid the horror and confusion of that day. Through all the fight he sought the King of England, and determined to slay him with his own hand. Henry had accoutred many of his knights in the royal armour to elude his enemies and to cheer his friends, and this honour the sword of Douglas rendered fatal to many. The battle having raged from the Bullfield, where Douglas had ranged his forces in a field of ripe peas, to hamper the heavy infantry of the King, right away to Haughmond, was at length decided by the death of Percy, who was shot by an arrow from an unknown bow just at the critical moment when Douglas, having killed Sir Walter Blount, the king's standard-bearer, was pressing Henry hard. But the cry "Percy is slain!" discouraged the rebel soldiers,

and the three hours' fight was brought to an end. Douglas was let go free without ransom by Prince Henry, who admired his valour, but Thomas of Worcester and Sir Richard Vernon were beheaded at Shrewsbury; also many knights and gentlemen of Chester were slain. In all, 2,300 gentlemen fell and 6,000 private men. On the king's side fell the Earl of Stafford, Sir Hugh Mortimer, Sir John Calverly, Sir Hugh Shirley, and Sir Robert Malveysin. There is a tomb to the latter in the church at Mavesyn Ridware. The others were buried in the convent of the Augustines, Blackfriars. Shortly afterwards the elder Percy, Duke of Northumberland, who, lying sick at Berwick, could not come up in time for the battle, being defeated by the Earl of Westmoreland, was put to death. Owen Glendower, who during the fight was lying inactive at Oswestry, maintained his independence and waged successful war in Wales against Henry, and died at last in peace. Henry erected a collegiate church at Battlefield in honour of his victory, and placed in it five canons to pray for the souls of those who fell on the fatal field. Shakespeare's account has immortalised the battle, but of course the trustworthiness of his narrative is interfered with by his free use of the dramatist's license. Still, though his account of Falstaff, and the fight for an hour by Shrewsbury clock, and the death of Percy at the hand of Prince Henry is fictitious, nevertheless much of his description is historical.

The original authorities are the "Chronicon Angliæ tempore Henrici Quarti," of uncertain authorship, and the "Historia Anglicana" of Thomas Walsingham, monk of St. Albans, who gives a very full and interesting account, published in Latin by the Master of the Rolls.

From Battlefield the members went, under the guidance of the vicar, to the Manor House at Albrighton Hussey, and inspected both the inside and outside of the house. The party then took carriage to Haughmond, where Mr. Lynam took them over the ruins, of which he gave an elaborate architectural description. Afterwards Haughmond Hill was ascended, and the party subsequently drove to Shrewsbury.

THE KING'S PALACE AT SUSA.

THE Louvre has been enriched by a collection of remains from Susa, in Khurzistan, obtained by M. Dieulafoy. A correspondent of the *Times* gives the following interesting account of the discoveries:—

His first trench opened on the Achæmenian tumulus was on the south-east side of the *apadana*, and at an acute angle with the line of the columns, he being convinced that it was on the southern side that the entrance must be sought. The labourers very shortly laid bare a colossal capital of a column, composed of a double-headed bull, which, happily, is now in the Louvre. Continuing the work until the original level of the court was reached, the excavators came upon a mass of brickwork that had evidently fallen in a piece, and face downwards. The bricks were about 14 inches long by 7 inches high and 9½ inches thick. They were composed of a hard cement, the outer surface being enamelled in colour and showing ornamentation, both modelled and in the flat. It was clear they formed portions of some vast piece of wall decoration, which it might be possible to reconstitute. This in effect was accomplished, and the result revealed a superb frieze of lions, in low relief, set between bands of ornamentation, incised in outline in the bricks, the whole being delineated in colour and enamelled.

The lions measure about 5 feet 9 inches in height, and more than 11 feet from the muzzle to the end of the outstretched tail. They are essentially naturalistic in treatment, while retaining archaisms in the lines of the face and superadded bosses in golden yellow colour on the shoulders and flanks. The anatomy is well understood; the accentuated joints, the massive paws, the lithe body, the long stride, and balanced head display all the characteristic points of the animal. The freedom of line and the exact modulation of relief testify that the sculptor was as masterly an executant as he was a close observer of nature. To these qualities must be added a sense of colour of rare delicacy. On a pale turquoise ground, suggestive of the limpid sky of Persia, the lions are relieved in a predominating tint of white, a tawny gray mane and the above-mentioned bosses emphasising the variety of texture and the more salient masses of muscle. Above and below the main motive are bands of ornament; serrated, honeysuckle, and rosettes, analogies of which are found in Egyptian and Assyrian edifices. Below the ornament are lines of cuneiform inscriptions. The extreme top was probably crenellated, since enamelled blocks decorated on five sides have been found. This implies that the frieze occupied an elevated position; M. Dieulafoy believes it to have belonged to one of the pylons or porticoes that stood in advance of the *apadana*, similar to those now remaining at Persepolis. The lower portion, he concludes, was faced with white and rose unglazed bricks (of which he has found many) arranged in diaper fashion, something after the manner of the outer walls of the Doge's Palace at Venice. Unfortunately the inscription is imperfect; M. Dieulafoy gives valid reasons, however, for attributing the decoration of the lions to the period of Artaxerxes II., and for the supposition that the pylons replace others of the time of Darius. Fragments of unglazed bricks, being portions also of a lion frieze, were found in such a position as to lead to the conclusion they had been used for filling in the more recent construction.

Other examples of enamelled bricks, with ornamentation in the flat, are believed by M. Dieulafoy to belong to a still earlier building, and to have been the walls of a staircase which had crenellated tops, like a staircase at Persepolis. The scheme of ornamentation is of rare beauty; on a ground of olive green spring ascending lines of conventional flowers; they are coloured alternately golden yellow and turquoise blue, each line being surmounted by a honeysuckle ornament in white. Their derivation is palpably Egyptian. As an example of surface decoration they will rank with the finest work of any period.

A trench sunk immediately in front of the *apadana* showed that the floor of the hall was only six inches above the level of the court. Excavations were then made south of the pylons, and the grand staircase was at length discovered. It is similar in plan to that at Persepolis, but on a larger scale, sufficiently wide for an army to ascend its stately steps. Two lateral entrances were found to the *apadana*. That on the east is supposed to be the royal entrance; the brickwork also showed clear indications of successive palaces. One mass of enamelled bricks, when separated, proved to be a portion of a panel containing a representation of a man wearing a green robe ornamented with embroidery in yellow, blue, and white; a tiger-skin hung from his shoulder; in his hand he held a gold-headed lance. The ornamentation is archaic, and suggests Babylonian influence. The face and hands are painted black; the type—thin lips, long nose—is not, however, of the African negro. M. Dieulafoy suggests that the ancient Elamites were black-skinned, and that the Susians were an isolated tribe of the antique colonists of Asia, the Diasgons of the Rig-Veda, the Ethiopians of the Levant mentioned by Homer and carefully described by Herodotus. It was in the vicinity of the royal entrance that the most important example of Achæmenian art was discovered. This consists of a vast expanse of wall space containing a frieze of armed men in enamelled bricks. The figures are moulded in low relief, and while soft have undoubtedly been finished by hand. The warriors are arrayed in processional order, and are seen in profile; each man grasps a lance, and carries, slung over his shoulder, a bow and quiver full of arrows. They wear a close-fitting cap with a rolled band, both of a green colour. A tunic open at the sides descends to near the ankles. Over this there is a long-sleeved jacket confined at the waist by a girdle; a vest covers the breast, its sleeves, open from the elbow to the wrist, showing the undershirt and the golden armlets. The costume is completed by low boots laced in front. The pattern of each man's dress is the same; the colour and ornamentation vary alternately. In one instance the tunics are yellow, spotted with rosettes in white on a green ground; in the other the tunics are white and covered with squares containing three towers, with triangular battlements, in yellow on a purple-brown ground. We have here one of the earliest known instances of heraldic blazonry, the towers are evidently intended for those of Susa; they are similar to the castellated towers in the representation of Susa on a slab in the Nineveh collection at the British Museum. The tunic has an embroidered border in purple and yellow, green and white. The long sleeves are varied; on the yellow tunics, purple; on the white, yellow. The quivers are dark purple strewn with bean-shaped patches of malachite. The figures stand about five feet high. They belong to a black race of Semitic type, prominent noses, firm lips, short curled beards, and a bush of hair curled at the ends giving them a decidedly resolute and martial air. It will be recognised here that there are obvious analogies with Assyrian sculpture, but there are also indications of Greek influence. Folds are not indicated on the Nineveh bas-reliefs, although they were doubtless expressed in the colouring. Here the tunics have plaited folds extending from the front of the figure downwards and backwards. Where the tunic opens the suggestion of a "cascade" is also Greek. The eyes are modelled as in Egyptian sculpture. Bands of similar ornamentation to that on the lion frieze frame the procession. The ground also is turquoise blue, not precisely the same tint throughout, but here inclining to purple-blue and there to green. So with the costume, where varieties of tone and delicate modulations of tint are arranged with consummate taste. It may be said that we have in this unique and remarkable frieze one of the most splendid and important examples of chromatic decoration that have come down to us from antiquity. Certainly nothing in its special character as wall decoration can surpass it. A study of its technique will display some interesting methods of manipulation of the highest value to artists, but the discussion of which would be beyond the scope of the present notice.

Those acquainted with the Persepolitan sculpture (a small

collection of marble bas-reliefs is to be seen at the British Museum) will recognise figures similar to the above in the bas-reliefs from the staircase; the costume, however, is somewhat different. In point of artistic excellence the Susa work has a decided advantage, showing, undoubtedly, that the Persian artist had a more pronounced aptitude for modelling than carving. It must, however, be remembered that the Persepolis figures have lost their colour. The scheme of colouring applied to stone and marble, and its method of application at this remote period are, saving in the case of some Egyptian edifices, comparatively unknown to us. Detailed descriptions of Persepolis, as that, for instance, by Flandrin, omit all reference to the fact of the stones having once been painted. No indications of applied pigments are apparent, but that is scarcely matter of surprise, considering their long exposure to the weather. Neither in the double-headed bull capital and other sculpture from Susa can traces of colour now be observed, yet here also exposure and subsequent burial in earth soaked by torrential rains will account for its obliteration. But it is impossible to conceive that where the walls glowed with chromatic decoration, where the pavement shone with precious marbles, and where the roof was spread with ultramarine and gold, the columns and capitals were allowed to remain in their Quaker garb of cold gray—such is the colour of the limestone. The eye accustomed to the public buildings and monuments of Paris and London accepts this monotonous gray without question; it is critical of form, but insensible of the absence of colour. Not so the ancients; the Susian was compelled to use stone for his supporting columns, his predilection was for the moulded brick, whereon he could spread his dazzling enamel. But nothing was easier than to colour the former in harmony with his cherished vitreous glaze. How long he had acquired the art and whence derived can be stated with tolerable certainty. The frieze of warriors is of the time of Darius. Earlier specimens of glazed bricks have been found at Nineveh and Babylon. Still earlier are those from Tel-el-Jahûdî, for they bear the cartouch of Rameses II. An examination of these remarkable fragments (due, we believe, to the enterprise of Mr. Greville Chester) in the Egyptian department of the British Museum will show certain of the original motives of the Susian decoration. Historians of Italian art speak of the "discovery" of Luca della Robbia; here is the faïence decoration in the highest state of excellence more than 2,700 years before he was born, and, in respect of imposing design, nothing from his furnaces approaches the Susian friezes.

Besides the artistic value of the frieze of warriors, it possesses a remarkable interest historically considered. Readers of Herodotus will remember that his description of the costume of the Persians and the arms of the guards—the Immortals—tallies exactly with that on the frieze, even to the silver knob on the foot of the lance. Thus we have brought before our eyes the effigies of the body-guard of the Persian king, that would be appropriately depicted on the wall of the porticoes surrounding his palace. It was doubtless in the *apadana* that Xerxes assembled his council before setting forth on his expedition against the Greeks, related by Herodotus. And if the same Xerxes was the Ahasuerus of the Bible, it was here he held his great feast. "Now it came to pass in the days of Ahasuerus (this is Ahasuerus which reigned from India even unto Ethiopia, over an hundred and seven-and-twenty provinces), that in those days, when the King Ahasuerus sat on the throne of his kingdom, which was in Shushan the palace, in the third year of his reign, he made a feast unto all his princes and his servants; the power of Persia and Media, the nobles and princes of the provinces, being before him; when he showed the riches of his glorious kingdom and the honour of his excellent majesty many days, even an hundred and four score days."

Thanks to the discoveries of M. Dieulafoy, we can, in imagination, come up from the city by the gently inclined road for cars. We curiously examine the stately façade of the *apadana*, glancing at the Immortals that guard the precincts of the enclosed court, cooled by fountains and water tanks. We pass between the pylons, staying to contemplate the gigantic human-headed bulls covered with elaborate inscriptions (these we know from their Persepolitan fellows, those at Susa are not yet discovered). We stand at the head of the grand staircase and see before us the massive citadel and to the left the enormous pile of the King's palace and the palaces of his wives. Then retracing our steps we enter the many-columned *apadana*, stand on its "pavement of red, and blue, and white, and black marble." There are "white, green, and blue hangings, fastened with cords of fine linen and purple to silver rings, and pillars of marble," and "the beds (couches) are of gold and silver." We can stroll through the porticoes, the walls of which display the pictured Immortals, and comparing them with the living originals, admire the sculptor's proficiency. Then passing behind the north portico, a dip in the outer fortification permits us to contemplate one of the most marvellous panoramas on the face of the earth. Below lies the city with its domes and monuments interspersed with groves of date and konar and lemon trees, beyond in the dazzling sunshine stretch rich pastures and golden seas of corn, and in the far distance rise the snow-topped chains of Láristán and the Bakhtiyárí.

M. de Roncourt, the Director of the Louvre, is preparing a handsomely decorated hall in that building for the reception of the contents of the 275 cases containing the multifarious objects of the Susa find. To his constant support and interest with the Government is due, in a great measure, the successful result of the exploration. And, if we are rightly informed, through his courtesy in furnishing South Kensington Museum with reproductions of the friezes the English public will before long become acquainted with those remarkable examples of Achæmenian art.

TECHNICAL EDUCATION CONGRESS.

An international congress on technical education, commercial and industrial, was held last week at Bordeaux. Sir Philip Magnus read a paper on technical education in England. He stated that the English are no longer so dependent as they were on Parisian artists for industrial designs, and that they now almost exclusively employed English draughtsmen in manufacturing lace, carpets, wall-papers, curtains, and furniture.

M. Roy, the delegate of the Chamber of Commerce of Paris, replied to these statements. He admitted that, in consequence of the very meritorious efforts of associations and private persons, the production of articles of luxury had made great progress in England, under the direction of Parisian managers, tempted to cross the Channel by the attraction of high salaries. But much was still wanting to elevate the taste of the English to the French level. Especially with regard to tissues, Lyons, Saint-Etienne, Rouen, and Roanne maintained an incontestable superiority. It should, however, M. Roy added, be admitted that English competition was in the main a fair one. The case was quite different as regarded German competition. The English strove to equal the French by improving their methods and getting their work done by good men. The Germans purely and simply appropriated French patterns and reproduced them in inferior goods, which they sold as French products. M. Roy had no hesitation in stating that, as regards the greater number of products, France could manufacture more cheaply than England, and with the same cheapness as Germany. The Germans and the English were spreading reports everywhere that the French could not manufacture cheaply. They knew better than anybody that this was a complete error. But they also knew that the best means of closing the markets against rival manufacturers was to say that the goods of the latter were dear. By dint of hawking about this calumny in all directions Europe had begun to believe it, and the error had even taken root in France.

AMERICAN SANITATION.*

By John B. Gass, A.R.I.B.A.

(*Concluded from page* 188.)

The bath tubs are ordinarily of tin and planished copper, 16, 18, and 20-oz. metal; they are also used of iron, enamelled or painted, while the earthenware ones are imported from England. In the overflow to bath tubs, as ordinarily arranged in English baths, the dirty water rises to some height in it as in the bath when let off; it, therefore, gets fouled, and not getting flushed is a frequent cause of bad smells. In many baths in America there is no overflow at end, but a copper or brass stand-pipe, the height for water, fits into outlets and serves as plug.

Wash-basins are in single pieces of earthenware, with several patent overflow and wastes; the stand-pipe overflow is in use for these, the basins being drained from the back, with the stand-pipe in recess, and raised or lowered for outlet by small lever at the top of basin. Kitchen sinks are the same as in England, and made of metal or porcelain, with outlets as used in wash-basins.

Each of the plumbing fixtures is separately trapped, there being many traps of varying value. The common S or V trap, with ventilation connection attached, is ordinarily used. Putnam's Sanitas trap is said to be made so that it cannot be syphoned. It consists of an adaptation of the S trap, with the water passage diverted by a bent plate, causing it to flow round a strong glass bowl let into side. It has no moving parts, is easily cleaned, the interior being exposed to view, and holding a large quantity of water. The water seal cannot be readily broken. There are several traps having movable parts, usually with ball valve, but these are always liable to get out of order.

* A paper read at the Congress of the Sanitary Institute on Thursday, September 23.

To kitchen sinks numerous forms of grease traps are used: the ordinary one is outside in yard, forming a settling pit and with cleaner on top. The "Dececo" flush pot is fixed underneath sink; it is made of glazed earthenware, inverted-pear shape, and holds about six gallons. In the sink is the ordinary grid with waste, which discharges into the flush pot, at the bottom of which is also outlet, with plug worked by lever from top of sink. When the pot gets filled the outlet from it is opened, the rush of water carrying everything with it and flushing the drain.

All the municipal plumbing regulations require that traps shall have back ventilation with air-pipe not less than $1\frac{1}{4}$-inch diameter for small traps, or 2-inch diameter for large traps. The question of the back ventilation of traps is a point of contention with many of the leading sanitary engineers in America. The results of experiments by various engineers are published in the National Board of Health's report for 1882 (folios 135 to 152), but unfortunately there is a complete divergence of opinion. If traps are not ventilated, there is a danger from syphonic action and traps emptying for want of air. When traps are ventilated the danger is from destruction of water seal by evaporation, or from aid to trap emptying by capillary attraction when any hair or material gets over the edge of trap. Further experiments are, I believe, being conducted on this vexed question.

At the Mass. Geiz. Hospital, Boston, a sanitary tower and ventilating shaft has been recently built for the wastes from hospital plumbing fixtures; it is an addition to the old building and there was only a limited site. The tower is 2 feet 9 inches square inside, and carried 24 feet above top floor ceiling, with flag cover at extremity, the outlets being at sides. It serves for two distinct sets of plumbing fixtures, and allows easy access to all the pipes. Wash-basins, sinks, and water-closets are grouped round it, with the baths between water-closets and end wall. A 5-inch soil-pipe is fixed in tower and runs full height, with a 3-inch ventilating pipe parallel to it and turning into it above highest connection. Steam-pipes from the heating apparatus are taken up the full height, allowing a good flow and return. All the wastes are separately trapped, and discharge into soil-pipe, with vent near connection into main vent pipe. There are 4-inch outlets from water-closet and sink, and 2-inch from bath-trap, the waste being under ceiling. The inner sink has 2-inch waste, discharging into soil-pipe at bottom, and connected with it as vent above ceiling line of top floor, each inlet into this having separate vent connected with continuation of waste below top ceiling. The pipes were all carefully planned and holes left in the walls; these were afterwards solidly built up. The steam-pipes in tower prevent any possibility of the wastes freezing, and cause a continuous upward current of air. There are ventilating flues, exhausting into tower where there is any possibility of smell or steam being offensive.

The water-supply to cities is from various sources—ordinarily from the nearest river or lake, which, being at low levels, necessitates the use of pumping stations. At Chicago a tunnel is driven under Lake Michigan, with inlet some distance from the shore, the water flowing to pumping station and there forced up large stand-pipe. At Philadelphia, the supply is taken from the River Schuykill, quite close to the city, the land for twelve or fourteen miles on each side of the river having been acquired and formed into the beautiful Fairmount Park. This park to some extent keeps the river partially free from objectionable drainage, but not altogether, the cemeteries, for example, draining directly into it. Dr. Billings says, in a recent article, that the cities whose water-supply is more or less polluted by sewage are so numerous as to form the rule rather than the exception.

It is of some interest to note that although a better water-supply is contemplated at Philadelphia, and the reservoirs partially made, the work has been for the time abandoned, owing, I am told, to causes which unfortunately too often interfere with public works in America, and also to the necessity for the city fathers being economical in everything except the new public buildings, whereon they are lavishing immense sums of money.

The water-supply pipes to buildings are of various metals, but ordinarily of drawn lead tinned inside. Seamless drawn brass tubing is largely used, particularly where the pressure is heavy or the water very soft. For cold water the pipes are tinned inside, but this is not necessary where the water is not used for drinking purposes or for hot-water supply. Where exposed to view all brass tubes are coated with tin, plated or varnished with shellac. Wrought-iron water pipes are also extensively used, the inside being galvanised, enamelled, lined with tin, and occasionally glass lined. Other protecting mediums are of coal-tar or paraffin enamel, and of course there are many patent solutions, one having a base of vulcanised rubber. Iron pipes are sometimes zinc-cased outside, particularly when exposed or where possible leak would do injury. In fixing, the horizontal pipes are secured by stout brass bands, screwed, while vertical pipes have cars soldered to the pipes and screwed.

It will be understood that the methods of sanitation before described are not in general use throughout the country. The remarkably rapid growth of most of the western cities, and the natural difficulties of the disposal of refuse, conjoined with the general apathy in matters of sanitation, from which both Americans and we ourselves are only just emerging, leave a great deal to be done everywhere, and it must take many years to bring most of the American cities into a thoroughly sanitary condition. Even in so enterprising and wide-awake a city as Chicago, for example, behind the fine houses in its famous Michigan Avenue there is hardly a single house, I am told, where proper provision is made for the disposal of the refuse of the household. The decaying vegetable and animal matter is simply thrown into the unpaved back street, or on to the nearest unoccupied ground, and allowed to lie and rot there. At all times these alley-ways are filthy, and in hot weather both disgusting and a source of great danger.

But the American public mind is rapidly awakening to a recognition of the necessity for proper sanitation, and, with its hospitality to all new ideas, the inventive genius of the people, and their insatiable desire for "progress," I think it is very probable that they will move much more rapidly than we shall be able to do in our own country, with its conservative instincts and its archæological love for the "dear old cesspool."

THE PARISH CHURCH, HALIFAX.*

HALIFAX Church makes no appearance in the Conqueror's Domesday Book. Whether the town itself, under another name, finds a place there or not is a question which it would be out of place to discuss on this occasion. The first documentary reference to a church here is to be found in the charter ascribed to the year 1145, whereby William, the third Earl of Warren, granted the church of Halifax—under which title was passed also the manor of Halifax—to the Cluniac priory of St. Pancras, that his grandfather, the first earl, had founded, under the walls of his castle of Lewes. Of the fabric of the church thus granted I do not myself believe that any material portion is preserved. The next mention—so far as I am aware—of Halifax Church is discoverable in a very interesting letter which I have had the satisfaction of unearthing in the Public Record Office. The letter, written in Latin, and in a very cramped and contracted style of caligraphy, is assigned by the Record Office *savants* to the time of King John (1199–1216). In this document an early rector—Hubert Walterson—profusely and lavishly thanks the prior and brethren of Lewes for having without any merits—as he alleges—of his own, appointed him to the cure of the church of *Halifiex*—so Rector Hubert writes the name. This is, I fancy, the earliest original document extant in which the place appears at all by name. Adam de Copley is set down by Mr. Watson as the earliest rector whose name has survived, and the last was Walter de Chameur, promoted to the Bishopric of Lof'on, in France, but under what title that to me unrecognisable see of Lof'on may pass to-day I know not. In prospect of the resignation or decease of this last rector, Pope Alexander IV., in the third year of his pontificate, 1257, by his bull granted to the prior and convent of Lewes leave to appropriate the church and its appurtenances to their own use, assigning what was necessary in the way of maintenance to the vicars of their own appointment. The bull was dated at Viterbo, where it will be remembered this pontiff died four years later. An "apostolic mandate" was also sent at the same time, by the same pope, to the Benedictine abbot of St. Albans, commanding him to induct the prior and convent into the corporal possession of the church. Upon the promotion of Walter de Chameur to his bishopric, these acts of papal supremacy were executed, and in 1273 the Archbishop of York, before wending his way to the fourteenth Œcumenical Council, then convened at Lyons, commissioned his vicar-general to carry out the order of Pope Alexander IV., and, moreover, to apportion the income of the rectory between the prior of Lewes and the future vicars. In consequence, in 1274, the archbishop's vicar-general, after personally and solemnly singing mass in the church, duly inducted Ingolard de Turbard, the first vicar, into the living. The reason assigned for the change of the rectory into a vicarage in the archbishop's decree is that the Court clergy, and sometimes foreigners who knew not the English tongue, had by oppression, powerful entreaties, and violent threatenings of great men, been thrust into the rectory, attracted by the great profits thereto belonging, caring more for the milk and fleeces than the souls of their flock.

Portions of the church, as it was reconstructed shortly after the induction of its first vicar, still remain visible to our eyes, consisting of the larger part of the northern aisle wall, built of rough rubble masonry, and the two double-light windows that

* A paper by Mr. J. Lister, M.A., read at the visit of the Bradford Historical and Antiquarian Society.

pierce it. A third window inserted in the western and later portion of the same wall, is of similar design, style, and date. The jambs of the west door of the tower, and those of the great south door are also believed to belong to what is known as the Decorated period of Gothic architecture. Certainly to my mind the inner doorway of the north porch is covered with the rubble-built portion of the north wall. The style of the windows would lead one to fix their date about the year 1290, when the lancet style was changing into the geometrical. Why so little of the church of this period is preserved seems somewhat strange, as there is no tradition of any fire or other calamity necessitating the rebuilding of the church. Perhaps the great and rapid progress made in the woollen trade in our parish in the fourteenth and early parts of the fifteenth centuries, and the consequent increase of population, demanded the almost complete rebuilding of the church on a very enlarged scale. The church, according to my view, which I advance with modesty, but which coincides largely with that put forth by that late esteemed and indefatigable archæologist, Mr. Fairless Barber, was almost entirely rebuilt in the early years of the fourteenth century. Mr. Barber held that the building of this period consisted of all the present structure excepting the tower and the three eastern bays of the chancel, with a tower, of which the lower stage survives, set at the south-west corner. The position of the present chancel screen appears to me to mark the site of the eastern wall of this church, and its rood screen stood, as several indications show, beneath the great arch which then distinguished the nave from the chancel. About 1450, as we have it on the alleged testimony of John Waterhouse, the present tower was begun and in twenty years completed. At that time, too, or later, the chancel was extended eastwards by the addition of three new bays, the clerestory formed in the chancel, and the two aisles of the chancel erected. The basement of the eastern wall of the north aisle, before this extension was made, is still visible in the vaults beneath the church.

There is so much to puzzle the architect in any attempt to denote the various stages of construction in the church that I must, as an amateur, speak with much diffidence, and without any pretence of dogmatising on the matter about which opinion is notoriously divided. I cannot, however, for one moment agree with those who hold that the arcade of the nave and the two western bays of the chancel belong to an earlier period than that covered by the Perpendicular style of architecture. The *cavettos* of the arches and pillars seem to me to proclaim in the clearest tones their fourteenth-century origin.

The great east window of the church is supposed to have been finished about 1480, at the close of Vicar Wilkinson's pastorate, whose crest of the unicorn may be yet seen on the parapet of the chancel. The only structural additions to the church after this time were the two chantry chapels, founded respectively by Wm. Rokeby, Archbishop of Dublin and Vicar of Halifax, and Vicar Holdsworth; the date of the former being about 1521, and of the latter about 1534. The founder of the north chapel, Archbishop Rokeby—who, by-the-by, was Chancellor of Ireland—directed in his will that his heart should be buried at Halifax, in the choir there, and a stone with a heart engraved thereon is reported to have been of old time visible in the chancel floor. Dr. Holdsworth, the founder of the north chapel in 1535, about the very time he was building his chapel, incurred the displeasure of the vicar-general of the newly-created Supreme Head of the Church of England, being accused, on the evidence of a servant to Lord Cromwell, of treasonable words, probably in relation to the royal supremacy, for which offence he was haled up to London and had to pay a heavy fine. His vicarage house was twice robbed in the reign of Edward VI., and he was, as he states, "in utter fear to repair to his vicarage of Halifax for fear of death and cruel handling." Nor was his fear misplaced, for on May 8, 1556, he was foully murdered in the vicarage house, as was afterwards alleged by one of his own kinsmen. The unfortunate vicar now lies buried in the chapel, which he had founded about twenty years previously. The chantries in the church were—beside Rokeby's and Holdsworth's, which are not named in the certificates of the chantries—six in number, viz.:—

1. The chantry of the Trinity, or Wilby's, on the south side of the church. 2. Hunter's. 3. Brigge's, on the north side of the church, adjoining the Rokeby chapel. 4. The Rood service. 5. Firth's. 6. The morrow mass.

The last was stipend paid to a priest to say mass daily, at 5 A.M., for the benefit of all servants, labourers in the town of Halifax, and it had been established by subscription on the part of the inhabitants.

The lady altar of the church, in accordance with ecclesiastical ritual arrangements, must have stood at the east end of the north aisle of the chancel, the corresponding aisle on the south side being probably used as the chapel of the patron saint, St. John Baptist. There was an altar in honour of the patron saint of England, St. George, and statues of SS. Anthony and Catherine in the church, before which lights were burnt on Sundays and other feasts. Tapers also were appointed to be burnt before the Blessed Sacrament on the like occasions. The gross value of the vicarage in the Valor Ecclesiasticus of 1534 is set down at 100*l.*, the net at 84*l.* 13*s.* 6*d.* The number of "housling people" at the beginning of Edward VI.'s reign is returned in the chantry certificates at 8,500, and the church was served by the vicar and an assistant priest, and also to some extent by the six chantry priests.

The font canopy is a splendid example of Gothic carving, and was in Mediæval times gorgeously illuminated in gold, blue, and vermilion hues. This treasure of art was removed from the church in Puritan times (1650) by one of the churchwardens, and conveyed to Chr. Hartley's parlour, where it remained till Charles II. and the Anglican ritual were restored. Portions of the old rood loft were visible before the late restoration of the church. The loft was, as usual, crowned by a crucifix, referred to in several old wills. When the Royal supremacy triumphed, the Royal Arms, supported by the lion and the unicorn, replaced the crucifix, and the figures of SS. Mary and John. Of the old stained glass with which the church was lavishly adorned in the Catholic period, only the merest fragments escaped the process known as "purifying the churches," in the days of Edward VI. The few but excellent relics of this old glass are all placed in the little dormer window on the south-west side of the nave. Among these may be detected the first syllable of the murdered vicar (Dr. Holdsworth's) name, the painted windows of whose chapel was destined to beautify the church for barely fourteen years. The chancel stalls, with their *misericordes*, are of considerable artistic interest, the carving of some of them being of superior character. In the nave the solid oak benches of probably the fifteenth-century period may still be seen enclosed in the Jacobean pews. The arms painted on the roof of the church are—in the nave those of the vicar's, and on the chancel roof principally those of Halifax parish families.

The registers of the church are believed to be the most perfect and the best preserved of any parish church. They start with the year 1458—the year in which Henry's vicar-general, Cromwell, issued the injunction to the clergy by which the keeping of them was enforced. The first volume is on paper, and has not been copied on parchment, as ordered in 1603. The very valuable library of early printed books owes its origin, we are told, to Vicar Clay, who lies buried in the vestry among his books.

BUILDING SOCIETIES ON THE CONTINENT.

IN France little has been done in the direction of building societies. The French, and more especially the Paris, workman prizes the liberty to live where he likes, and has not perhaps so strong a feeling for a home as the English and Germans. Indeed, no instance of co-operation by workmen alone for this object can be found. At Mulhausen leading manufacturers, in order to build houses for their hands, formed a building club, advancing the necessary money at low interest, the price of each house being 3,000 frs. The workman became an owner by paying from 2 frs. to 400 frs. down, and from 13½ frs. to 16 frs. monthly for seventeen years. Thus a man of twenty-five making his first payment might look forward to being actual owner of the house at forty-two. With the money paid in, this club went on building fresh houses. At Strasburg benevolence also endeavoured on a different system to improve the dwellings and lower the rents paid by the working classes.

Near Paris, at Colombes, a certain number of houses were built by a club started by the "Caisse d'Escompte des Associations Ouvrières." Members in turn of their seniority had the refusal of the apartments thus built: payment might be made gradually in small instalments if required. A few similar building societies have been started, but apparently not by co-operation of workmen spontaneously. Some large manufactories, such as M. Godin's "Familistère," build dwellings on a large scale for their hands.

At Havre, Her Majesty's Consul-General says that the "Société Havraise des Cités Ouvrières" was founded in 1871, with a capital of 200,000 frs., to provide improved dwellings for workmen. It erected in that year seventy-seven houses, and in 1883 forty, of which the first lot cost 3,000 frs. to 5,000 frs., and the last from 5,000 frs. to 6,000 frs. a piece. The interest payable to the shareholders is limited to 4 per cent. The rent, including interest and redemption, in fourteen years, is fixed at 10 per cent., making a yearly payment of from 300 frs. to 600 frs This is higher than the ordinary workman can afford, and the tenants are nearly all of a superior class. At the end of 1884 forty-five houses were entirely paid for, and had become the property of the occupiers.

"Cités ouvrières" do not, however, as a rule, seem to be popular with the working classes. The question of the lodging of workmen, in the towns especially, is a very important one; their roving habits are admitted by the evidence to be an evil. Co-operation will never take great hold in France till the

workmen's residences become more fixed, but it may be said that co-operation in production is the best way to make the workman settle down.

Societies for building dwellings for the poorer classes have met with but little success in Germany. They appear to have succeeded best in Alsace, and one at Flensburg, in Jutland, founded in 1878, possesses, according to the report of 1884-85, nineteen houses, with a value of 100,000 marks, and 800 members, one of whom has the sum of 87,000 marks to his credit in the society's books. Schulze-Delitzsch says that "so much capital not subject to withdrawal is needed for the successful and persistent activity of a building association that the procuring thereof will always form one of the main difficulties of such societies."

To overcome this difficulty, and to bring the capital up to the requisite total, several societies grant permission to acquire several business shares, according to the amount of which losses are apportioned, or grant permission to acquire several business shares, but with a proviso that the losses are to be defrayed in the first place from the first business shares, the remainder from the second, and so on.

To obtain a capital not liable to withdrawal they admit of the admission of sleeping partners with deposits not liable to withdrawal before the lapse of a certain time, who share in the profit and loss of the society, and have attempted the establishment of a loan association for building societies on a system of limited responsibility.

In commenting on the want of success that has attended such societies, the editor of the report of the German Co-operative Union for 1884 remarks that they were mostly started at a time when land was cheap, and immigration to the large towns caused a brisk demand for houses. This demand, however, no longer exists, and it is now difficult for the societies to obtain a rent sufficient to pay interest on money borrowed, and still more difficult for them to sell profitably, while the great difficulty of obtaining capital not liable to withdrawal is as conspicuous as ever.

The number of building societies has risen from six in 1872 to twelve in 1873, twenty in 1874, thirty-three in 1883, and thirty-three in 1885 (January 1).

Berlin would appear at present to be the best possible field for an association of this kind, and such an association has accordingly been established (1886) by Herr Schrader, at Köpenick, within a few miles of Berlin, but in a direction in which the city is little likely to spread, and consequently the value of land is unlikely to rise greatly. This association, which proposes to build for the poorer class of artisans and labourers, has been founded with every hope of success in spite of its founder's unfavourable experience in similar undertakings in other parts of Germany.

In Austria five co-operative building societies existed in 1881, all but one of which were in Lower Austria; their object was to provide dwellings for artisans, but they were not a financial success, and are all at present in liquidation.

Co-operative associations for building improved artisans' dwellings, and letting or selling them to their own members, are fairly numerous in Italy. In some of these the houses or apartments are drawn by lot when completed, the winner ceasing to belong to the society, the amount of his shares being accepted in part payment, and the balance being made up by monthly instalments, extending over a period of from ten to twenty-five years. In others the members desirous of hiring or purchasing the house must send in an application to the directors, and, in case of purchase, must pay down one-fourth at least of the yearly rent, and the remainder in monthly instalments, extending over a period of ten years. After payment of two-thirds of the price, the occupier may be recognised as owner, the society still keeping a lien on the property until completion of the payment. A house or apartment taken merely on lease must be for the sole use of the member and his family, and cannot be sublet. In other respects the statutes of these societies resemble those of other co-operative enterprises, and owing to their recent introduction it is not possible to obtain any definite information as to their results.

In certain parts of Belgium efforts have been made, from time to time, to provide improved dwellings for the working classes, but with very partial success, the pay of the work-people being, generally speaking, too low to enable them to profit by such assistance. At Ghent some years ago plans were prepared for building artisans' dwellings which were to become the property of the tenants after a fixed number of annual payments, but the scheme eventually fell through. The Ghent workmen's quarters are usually built in large blocks, incapable of subdivision; they are well built and mostly new, rents varying from 1 fr. 50 c. to 3 frs. a week.

At Antwerp there is a society (De Maisons Ouvrières) which has built a great many workmen's dwellings in the northern quarter of the city, and has paid special attention to sanitation. The charitable society (Bureau de Bienfaisance) has also constructed 150 dwellings in the northern and 85 in the southern districts of Antwerp; they are well built, comfortable, and salubrious, let at rents varying from 5 to 8 frs. a week. These lodgings are all much sought after, and lists are kept, on which intending tenants can inscribe their names for the vacancies as they occur.

None of the above undertakings, however, are carried on by means of co-operation. There are no co-operative land and building societies as in England, and all that has been done to improve the homes of artisans is due to private enterprise and speculation.

On the other hand, the People's Bank do all they can to help any provident workmen who desire either to buy the homes occupied by them or to build new dwellings, and offer special facilities to enable their clients to raise the necessary capital, to be paid back in periodical instalments.

In Amsterdam and Leeuwarden there exist workmen's co-operative societies of this nature, purely self-supporting. The Amsterdam society ("Building Society for the Provision of Workmen's Dwellings") has been very successful of late years. It was at first established on purely socialistic principles, the formation of capital forming no part of the scheme; but it very soon got into difficulties, and was obliged to adopt the economic principles which it had begun by rejecting. The contributions of the members are fixed at a minimum of 2*d.* per week, or 5 fl. (8*s.* 4*d.*) per annum. The capital for building purposes is raised by mortgage loans, and the municipality has assisted the society as far as possible in placing cheap and suitably situated land at its disposal. The right to acquire a dwelling is distributed by lot among the members, and the rent paid includes the amortisation of the property. Three per cent. interest is paid on all the deposits. In case of the death of a member, his widow or heir can withdraw the deposit, but in no other case is the withdrawal permitted, and the renunciation of membership involves forfeiture to the society of the amount deposited. The houses are let in flats, and the rent of two good rooms and a kitchen is fixed at 2 fl. 20 c., or 3*s.* 8*d.* per week; a comparatively high figure, but it must be borne in mind that building is exceedingly expensive in this city. The society has already constructed about seventy houses of three dwellings each, and is steadily progressing. The results in Leeuwarden are said to be also satisfactory.

Building societies are found in considerable number in Sweden. The members club together and subscribe to a fund for the building or purchase of houses, usually large houses divided into several small flats. When the society has a house ready to be inhabited lots are drawn for it, the member winning it paying off by degrees, under certain easy conditions, the sum fixed by the society, after due valuation, as the amount to be paid before the house becomes the member's own freehold.

Correspondence

The Royal Academy and Education.

Sir,—The article you published last week under the title of "The Royal Academy and Education" has caused me so much amazement that I ask leave to make a few comments on it, particularly as you have done me the honour to refer to recent letters on the subject in the *Times*.

The words used by the writer of the article, such as "the dream of Reynolds when the Academy was established" and "Reynolds and the founders of the Academy," half imply that Sir Joshua was foremost in the steps taken to establish it, while the whole article suggests that education by mere sublunary methods of teaching was not one of the principal objects for which the Academy was founded. Now it is possible to read, in a quarto publication issued by the Academicians of 1860, the original Memorial, with the names of the twenty-two memorialists appended, praying for that assistance, patronage, and protection which led to the grant of the historical "Instrument." The only man of the world amongst them appears to have been Mr. (afterwards Sir William) Chambers, Architect of the King's Works, a gentleman in whom George III. had apparently implicit confidence. Having, at a personal audience, previously prepared the way for the interview, he, with Francis Cotes and Benjamin West, painters, and George Michael Moser, a sculptor and gold-chaser, presented the memorial on behalf of the artists—a memorial which Reynolds had refused to sign. Indeed, the execution of the Instrument by the King was postponed because Reynolds declined the Presidentship of the new Academy, and it was only in deference to the unanimity and goodwill displayed by his colleagues that he at length consented. As for the objects for which the Royal Academy was founded, the memorial prayed the king to assist in "establishing a well-regulated School or Academy of Design, for the use of students in the Arts, and an Annual Exhibition

open to all artists of distinguished merit, where they may offer their performances to public inspection, and acquire that degree of reputation and encouragement which they shall be deemed to deserve." The Instrument of institution contains twenty-seven paragraphs, thirteen of which relate to Teaching and one to the Annual Exhibition, though the latter is mentioned in two other paragraphs. The first form of the Diploma, drafted by the king's own hand, contains the words :—"We have thought fit to establish in this our city of Westminster, for the purposes of cultivating and improving the Arts of Painting, Sculpture, and Architecture, under name and title of the Royal Academy of Arts, and under our own immediate patronage and protection." Further, Sir Joshua Reynolds, having conquered his hesitation, delivered a discourse at a general meeting of the Academy on January 2, 1769, containing, at the outset, the words, "An Academy in which the polite Arts may be regularly cultivated is at last opened amongst us by royal munificence"—a reference amplified by a statement of the Academicians of 1860, in the document before mentioned, that "the earliest subject of consideration with the Council was the establishment of the *Royal Schools*, consisting of an Antique academy and a school for the living model."

In your article the writer informs us that there are many artists in France who would abolish the "Academic School of the Fine Arts," and doubtless such persons abound among a people who have recently done things even more foolish. But is he not mixing up the privileged and perpetually-hated *Academy* of the Fine Arts, which is housed in the Palais Mazarin, with the *School* of the Fine Arts, next the Quai Malaquais and the Rue Bonaparte? Even French wits are content to urge only reform on the School authorities, however bitterly they may demand the abolition of the Academy. I was under the impression that Frenchmen of all political colours and shades were proud of the Ecole des Beaux-Arts, and as the proof of a pudding is believed to lie in the eating of it, what better judges of pudding can be found than the citizens of the United States? Young Americans who cross the Atlantic, and who call at the Royal Academy and the Royal Institute of British Architects to say a few kind, cousinly words to Mr. Spiers and to me, *hasten on to Paris to learn.* Native and inherent originality, tempered by French method and refinement, has already sown the seeds of "a style" among the rich and gentler communities of the United States; and in the marvellous revolution which is now developing within the English-speaking nations, under the half-closed eyes of careless England, the French Ecole des Beaux-Arts is silently playing a part so efficacious, that the architects of Greater Britain are likely before long to seek their inspirations, not in London or in the capitals and cathedral towns of Europe, but in the new cities and rural districts of the United States.

The writer of the article is also pleased to say that, "If"—and there is a splendid unconsciousness in his use of the virtuous monosyllable—"If a mode of education is necessary to supplement or supplant the training received in an architect's office," then the Council of the Institute of Architects ought to do, or to have done, something. But will he permit me to express the belief that, while a dominant body like the Royal Academy maintains a sham school of architecture, no institution in this country can succeed in establishing a real one? Hence—and as an individual opinion it must be taken for what it is worth—the Royal Academy is still doing almost incalculable injury to the profession of British architects, both old and young. In this regard the writer of your article has rendered a public service by reminding us that "Professor Cockerell quoted with approval the saying of Philibert de l'Orme, that those who amuse themselves with making pretty drawings only, are those who least understand the real art and science of architecture." Continue, sir, the same strain; strike lustily on that string, and you may yet convert the architectural class of Burlington House into a School of Architecture, or sound its death-knell.

As loyal subjects of the Queen, Mr. Editor, you and I would prefer the former, and that you may get it is the wish of

Your humble servant,
William H. White,
Fellow of the Royal Institute of British Architects.

P.S.—That all British architects should clearly understand that the Royal Academy owes its "Instrument" of institution *principally to Sir William Chambers*, may I beg you to print the following extract from the Minutes of its first meeting held in Pall Mall, on December 14, 1768 :—"His Majesty . . . desired that their [the memorialists] intentions might be more fully explained to him, and that it might be done in writing as soon as was convenient. In obedience to this order, Mr. Chambers drew up a sketch of a plan, which, having shown to as many of the gentlemen concerned as the shortness of the time would permit, and obtained their approbation, he presented to His Majesty on December 7, who perused the whole, was graciously pleased to signify his approbation, and directed that it might be drawn up in form, in order to be signed by him, which Mr. Chambers accordingly did; and on Saturday, December 10, 1768, it was laid before His Majesty, who signified his approbation, and ordered that the plan should be put in execution, signing the instrument with his own hand."—W. H. W.

London: September 28, 1886.

Architectural Federation.

Sir,—Will you allow me to draw the attention of all architects and others who are in favour of Architectural Federation, and who may not have signed the form of declaration, that October 15 is the date fixed by which time all the forms must be returned to me, and that any architect, surveyor, &c., who may not have received a form can have one at once on applying to me.

I may add that this movement now lies in the hands of the members of the profession, and it is for them to declare by their unanimous voice whether or no this proposed registration is to be carried through. It is, therefore, of the utmost importance that every individual member should sign the declaration.—Yours truly,

Edgar Farman,
Hon. Sec., Architectural Federation Committee.

39 King Street, Cheapside, London: Sept. 26, 1886.

The Manchester Stove and Smoke Washing.

Sir,—My attention has been called to an article in a recent number of *The Architect*, wherein it is stated that smoke has been washed from a chimney into a main sewer. Allow me to say that this was done in connection with the Manchester Stove daily during the whole of the time the International Smoke Abatement Exhibition was being held at Manchester in 1882.—Yours faithfully,

G. L. Shorland.

Imperial Buildings, Ludgate Circus, E.C.

P.S.—The Manchester Stoves are made either with or without this smoke washing arrangement.

GENERAL.

Mr. Thomas Woolner, R.A., has offered to give a cast of his bust of Carlyle to the town of Dumfries.

A Bronze Statue has been decided on as a memorial of the late Mr. A. Balfour at Liverpool. The work will be entrusted to Mr. Bruce Joy.

Mr. John Eaton, architect, has been appointed a justice of the peace for the borough of Ashton-under-Lyne.

Mr. Edgar Goff, architect, of Lowestoft, died on the 24th ult., at the age of 39.

A Sum of 10,437*l.* is now available towards the erection of a new building for the Glasgow Athenæum, being two-thirds of the whole amount required. To obtain the necessary funds the institution has been constituted a limited company.

A New Building for the Albion Club, Ramsgate, is being erected on a prominent site facing the sea, from the designs of Messrs. Pugin & Pugin. Mr. Martin, of Ramsgate, is the contractor.

Premises for the Ulster Bank are to be erected in College Green, Dublin. The two houses, Nos. 32 and 33, known for years as the Arcade Hotel and the Arcade Luncheon Bar—Anderson's and Spadaccini's of old—have been obtained as the site.

The Sixty-fourth Session of the Birkbeck Institution will commence on Monday, October 4. The class-list is of the most comprehensive character, and several lecturers of eminence have been engaged.

The Croydon Town Council at their last meeting passed a resolution, by a majority, to destroy the old archway in Church Road, leading to the remains of the old palace of the archbishops.

The Liverpool Corporation have arranged for the delivery of three courses of free lectures. The first course is to be given by Mr. Chas. T. Gatty, F.S.A., who will deliver six lectures in succession on "Art and Antiquities." The special subject dealt with in the first two lectures will be Buddhism, and two lectures each will be devoted to Greek art in Athens and Pompeii.

The Foundation-stone of St. Joseph's New Catholic Church, Greenhill, Swansea, which is being erected from the designs of Messrs. Pugin & Pugin, will be laid by the Bishop of Newport and Menevia, on Saturday next.

A Lake Dwelling is said to have been discovered in the excavations for a gasholder for the Moffat Gas Company. About seven feet below the surface were long pieces of black oak, which had formed portions of trees about three feet in circumference. The planks had apparently been disposed of according to some design, the erection of which they formed part being nearly square. The roughly-split wood bears marks similar to those made by stone or flint axes on black oak found where lake dwellings once existed, such as in the Castle Loch, Lochmaben.

The Architect.

THE WEEK.

The opening of a building having so much that is remarkable about it as is found in the new Constitutional Club is not an everyday event. Inside and outside it is attractive, and what is more, the attractions have been secured by an outlay that is without precedent in clubland. In the first place Mr. Edis has courageously departed from the style that was supposed to be indigenous to Northumberland Avenue. That roadway was assigned to the special care of the Institute of Architects, and forms a commentary on the arguments of people who insist on the advantage of a ruling power in architecture. Mr. Edis has constructed his building of a terra-cotta so admirable in colour that the owners of the adjoining properties should be grateful to him for introducing so much life into the general aspect. The site is triangular, but the difficulty is overcome by an ingenious treatment. What must strike every visitor on entering is the capital arrangement. In spite of the form of the site, the great rooms appear symmetrical. Every detail offers a fresh attraction. There is nothing that is heavy; there are no dark corners, and stuffiness is peremptorily banished. Excellent judgment has been exercised in the lighting by keeping the electric lights low, and making the ornamentation combine with them. In this part of the work Messrs. Verity & Sons have zealously co-operated with the architect. The marble and mosaic by Messrs. Burke & Co. are in chastened colours. In seeking for beauty, it has not been forgotten that a club is a restaurant on a great scale. The kitchen occupies the basement, and here Messrs. Benham have introduced their latest improvements in apparatus. Altogether the building is worth study as an exemplification of what may be called "a new departure" in clubhouses.

Julius Cæsar, according to Plutarch and Shakespeare, left all his walks, his private arbours, and new planted orchards to the Romans and their heirs for ever, and Marc Antony remarked when he read the will: "Here was a Cæsar! When comes such another?" Does not the bestowal of Chantilly by the Duc d'Aumale to the Institute of France suggest an answer to the question? Centuries have to elapse between the appearances of benefactors of their class. If we imagine what Chantilly was to the Duke we can understand the greatness of the gift. The place was historic for centuries before the Princess de Montmorency, who was the owner, married Condé. Of their son, the great Condé, it might be said that he fought, built, and squandered with equal impetuosity. An old madrigal that was much admired in the seventeenth century made him say, "I am prompt, proud, generous, and valiant. Nothing is comparable to my glory. If I have not a crown, it is owing to fortune. I am satisfied with meriting one." The letters of Madame de Sévigne reveal to us in what a princely style he purchased the goodwill of his contemporaries. Fortune, however, was careful to compensate his heirs by marriages with wealthy ladies, and much of the money was expended on Chantilly. But the Revolution brought destruction to most of the costly buildings. The Restoration gave it back to the heirs of the old owners. At last the Duc d'Aumale inherited the estate; then it passed from him, and it was only on the downfall of the Second Empire that he was allowed to regain it. From that time it was the aim of the Duc d'Aumale to make Chantilly a treasure-house that might be unique. Everything in it—pictures, books, statues—was not only costly, but of intrinsic value. From time to time it was related what large sums were given for masterpieces of painting or for rare editions of books. The Duc d'Aumale possesses one of the most cultured intellects in Europe, and his powers appeared to be concentrated in perfecting Chantilly. For years back many of the first artists in France have been engaged on the adornment of the palace. The bequest of such a place is worthy of a king's son, especially as the owner has to suffer the bitterness of exile. At present it is only with bated breath that the gift is acknowledged; but some day hereafter the country may feel it is under an obligation to be grateful.

In addition to the English painters who have won gold medals through their works in the Berlin Exhibition, several other foreign artists have been successful. Professor Victor Tilner, the sculptor, and Professor Rudolf, the painter, both of Vienna, the Belgian painter M. F. Verhas, and the Italian painter M. Auguste Carelli have all received the grand gold medal. It will be seen that while England received three of the medals (Mr. Herkomer, Mr. Ouless, and Sir J. E. Millais), with the grand medal for science to Sir F. Leighton, no other foreign country obtained more than two medals. Germany was awarded seven medals, its representatives being the five painters Frederic Geselschap and Paul Flickel of Berlin, Herrmann Baisch of Carlsruhe, Charles Meyer of Munich, and Eugene Ducker of Dusseldorf, with the Berlin architects Henri Kayser and Charles de Grossheim and Adolphe Heyden. The Berlin sculptors have not gained any of the great medals.

The tower of Eiffel is likely to inspire everyone concerned in the French Exhibition with an ambition to attempt the colossal in all they undertake. That structure may excel every existing example of ironwork in height, but M. Alphand, the director of works, feels that it is open to him to have a piece of iron construction that will beat all in width. Up to the present the iron roof of the St. Pancras Station has held pre-eminence, because it is 240 feet in clear span. But M. Alphand dreams of having a span of about 370 feet for the machinery court of the International Exhibition. One of the most startling projects in engineering history was a timber roof 328 feet wide, which Colonel Emy designed, but which nobody would pay to carry it out. M. Alphand's roof will far surpass it. The estimate for the court is only 20,000*l.*, and that sum does not seem likely to pay for a big roof and walls. It will be doubted by some whether there is much advantage in so wide a span. In the Manchester machinery court the columns will not be more than 50 feet apart, and where engines are placed there cannot be too many supports. But it deserves to be remembered that according to the late Sir Digby Wyatt, who had better opportunities than most men for studying the arrangements of international exhibitions, the proper type of such a building is to be found in one of the great railway termini. He imagined the American men most likely to realise his idea. It will be remarkable if the French anticipate them, and it would be just, for they were the first to open exhibitions of art and industry.
